EVERY newspaper reader must by this time be tolerably familiar with the names Moldavia and Wallachia, however slight may be his knowledge of the geographical position, population, productions, political constitution, and social condition of these provinces. Their connexion with the Russo-Turkish dispute, which has occupied so large a share of public attention, both in this country and on the continent, during the present year, will cause them to be remembered for years to come. It is scarcely necessary to inform our readers that they form a debateable ground between Russia and Turkey, being situated on the north of the Danube, and having Russia on the east. The boundary stream between Russia and Moldavia, the more easterly of the two provinces, is the river Pruth, which, it will be remembered, was crossed by the Russian troops on the third of July. These two provinces occupy rather an anomalous position, being neither completely independent, nor wholly subject to Russia or Turkey. Nominally they are part of the Turkish dominions, but though more than once devastated by Ottoman forces, and now tributary to the sultan, they are not so completely subject to him as the territory on the south side o the Danube. Even the hospodars, or governors, cannot b appointed without the sanction of the Emperor of Russia However, the provinces unquestionably belong much mor to Turkey than to Russia. Hence, their occupation by th latter power is regarded on all hands as neither more nor les than an invasion of Turkish territory.

It is beyond our province to discuss at any length the merit of the dispute which has led to this invasion. Suffice it to say that the Emperor of Russia lays claim to be recognised as the protector of the twelve million Greek Christians in the Turkish dominions, and demands a formal treaty investing him with that office. The sultan, on the other hand, considers such a step equivalent to a complete sacrifice of the independence of his government.

COSTUMES OF THE MOLDAVIANS AND WALLACHIANS.

That our readers may be able to form some idea of the inhabitants of these provinces, and their state of civilisation, we here present them with a sketch of the costumes of different classes as they appear at the present day.

JAPANESE MYTHOLOGY.

THE SINTOO CREED, OR PRIMITIVE RELIGION OF JAPAN.

In order fully to understand the system of government in Japan, and the right by which the spiritual ruler, or *Mikado*, claims to hold his high, but, as will be afterwards seen, rather onerous, office, it is necessary that the reader should be made acquainted with the Japanese tradition respecting the creation of the world, and also with the principles of the religion of the country. We shall, therefore, proceed to give in this article a succinct account of the Japanese deities, premising that in the length of their names they almost rival some of the princes of the royal families of the continent.

Before the world was created, the Japanese believe that there was a confused mass of water, air, and earth, swaying to and fro on all sides, like the yolk of an egg mixed up with the white.

In this infinite space, which is entitled *Tako-mano-halo* (the plain of high heaven), arose *Ameno-minaka-nusino-kami*, self-created. His name signifies the superior god-like being who sits enthroned in the middle of heaven. After him came *Taka-mi-musu-bino-kami*, the highly elevated creating-god, and *Kamu-mi-musu-bino-kami*, the spiritually elevated creating-god. Each of these three primitive gods was independent of the other two.

At the time of the creation, the elements of chaos divided from each other. An under-stratum of the heavy and thick portions of the world was formed, while the clearer and lighter ones were carried upwards through their own want of weight. At first, though not sensible to the touch, they were visible, like smoke or a thick cloud. Gradually they formed themselves into the heavens, and, at last, attained such a degree of clearness as to become invisible.

The earth was still a young mass, as soft as mud, swimming about in the air, like the reflection of the moon in the waves, when there arose from it a kind of substance similar to the bud of the reed *Asi* (*Erianthus Japonicus*), and *Umasi-asi-kabihiko-dsino-kami*, the noble earth, god of the beautiful reed-bud, sprang into life; while *Ameno-soko-talsino-kami*, the architect of the vault of heaven, began and finished his creation.

Each of these two latter gods, also, like the first three, lived retired within himself, having nothing in common with the others. Combined with the former, they are peculiarly distinguished as *Amatsu-kami*, the five gods of heaven.

From the development and metamorphosis of Asi-bud, there arose between heaven and earth, the creator of firm land, by name *Kuni-soko-talsino-mikoto*. He reigned over the yet unfinished globe for more than a hundred thousand millions of years, a space of time which passes human comprehension. He is still worshipped in a temple of the district of *Oomi*.

His successor was *Kuni-sa-toutsino-mikato*, who also reigned for a like extraordinary period, until *Toyo-kumu-suno-mikoto*, the god of the richly overflowing marshes, assumed the reins of power, which he retained for a hundred thousand million of years. He, too, has a temple erected to him in the district of *Oomi*.

These gods had lived alone, floating in the immensity of the universe, without any female companions. From this period, however, we find female divinities living with them in a state of sisterly innocence. First on the list stands *Wu-hidsi-nino-mikoto*, the god who cooks the muddy earth, with his companion *Su-hidsi-nino-makoto*, the goddess who cooks the sandy earth. Both are worshipped in a temple in the district of *Issye*.

After a lapse of two hundred thousand millions of years, they were followed by *Oo-to-tsino-mikoto*, and his companion, the goddess *Oo-to-beno-mikoto*.

These two divinities disappeared after having reigned as long as their predecessors, and were succeeded by *Omo-tarunomikoto* and his companion *Kasiko-neno-mikoto*, who, after thousands and thousands of years had rolled away, made room, in their turn, for *Iza-na-gino-mikoto*, with his heavenly bride, *Iza-na-mino-mikoto*.

With this couple ends the period of the seven dynasties of the gods of heaven, which reaches up to *Kuni-soko-talsino-mikoto;* and it is to *Iza-na-gino-mikoto* that the creation of Japan is attributed.

Standing on the bridge that was floating in the heavens, *Iza-na-gino-mikoto* one day addressed his wife, *Iza-na-mino-mikoto*, in the following terms:—

"Verily, there should be somewhere or other a habitable country of the world; let us endeavour to find it in the waters which are heaving beneath us." Speaking thus, he dipped his spear, adorned with jewels, in the wide ocean, and stirred the waves round with it. The thick drops of water which trickled off the spear when he had withdrawn it from the waves, instantly thickened and formed an island, *Ono-koro-sima*, or the island that flowed together of itself. The god and his wife descended upon it, and together, by their divine power, created the other portions of the globe.

The next thing that *Iza-na-gino-mikoto* did, was to call into existence eight million of gods, who spread themselves simultaneously all over the country, commenced the development of its resources, and produced vegetation. *Iza-na-gino-mikoto* created also the ten thousand things from which the countless objects of every kind which we possess at the present day have all sprung. Meanwhile, the goddess *Iza-na-mino-mikoto* was not idle, but created the teregod, the godlike couple of the mountains containing metals, and the goddess of water. While, too, the climbing plants were raising their tendrils heavenwards from the earth, she planted under the waves the germs of the mosses, and ordered the goddess *Hani-yama-himeno-kami* to cover the hills with fruitful earth.

All the gods who had preceded *Iza-na-gino-mikoto* and his wife had started into existence of themselves, without being descended from any one. But *Iza-na-gino-mikoto* and *Iza-na-mino-mikoto* had a numerous family, the most virtuous member of which was their eldest daughter, *Ama-terasu-or-kami*, or, as she is otherwise generally denominated, *Ten-sioo-dai-zin*, the great spirit that lights the heavens. She was chosen by her parents as their successor in their earthly kingdom, over which she reigned in conjunction with her brother, *Tsuku-yo-mino-mikoto*, the god-like moon that looks through the night.

After a lapse of 550,000 years, she resigned the empire to her nephew *Amano-osi-ho-mimino-mikoto*, whom she had adopted, and who, after a reign of 300,000 years, was succeed by his son *Nimi-gino-mikoto*, who, in his turn, was followed, after a reign of 318,533 years, by his son *Hiko-hobo-de-mino-mikoto*. The next divine sovereign, 637,892 years later, was *Wu-kaya-fuki-awasesuno-mikoto*, the last of the five earthly gods, his successor being *Gin-mu-ten-woo*, whom he had by a mortal wife, and from whom, as we mentioned in our last chapter, the *Mikados*, or spiritual rulers of Japan, trace their descent—a fact which must, of course, entitle them to the respect and admiration of all those persons who esteem a man not for the noble actions he may do, but for the length of his genealogical tree. We have not the least doubt that the *Mikados*, if they were acquainted with the aristocracy of Europe, would look down on them as mere upstarts, in the same manner as the latter do on those by whose toil and energy they are supported in comparative but noble idleness.

The most ancient religion of Japan is intimately connected with the tradition we have just laid before our readers of the creation of the world. Taking its origin from the divine ancestors of the people, namely, the celestial and terrestrial gods, its religion has existed during countless generations of a good-hearted, simple population of fishermen and hunters, and has, up to the present time, maintained its position in the palace of the sovereign as well as the hut of the peasant. Although it is now no longer the sole religion of the Japanese empire, it is still protected by the state, reverenced by the rulers, and loved by the people.

This primitive religion is known in the Japanese language under the name *Kami-no-mitsi*, that is, the way or doctrine of the Kamis, or gods. It was not until a later period that the

designation *Sintoo* (*Schin-taó*), which is merely a Chinese translation of the old Japanese expression, was bestowed upon it. The word *Sintoo* was used to designate the primitive religion, in contradistinction to the Indian ritual of *Bultoo* (*Tŭ-taó*), which was introduced into the country at a subsequent period.

The principle of the Kami ritual consists in the worship of the celestial beings who created the universe and the island empire of Japan, and of the terrestrial gods who animated the young country with their presence, and whose descendants afterwards became its inhabitants and rulers.

The greatest amount of veneration, however, is paid to *Ama-terasu-kami*, the goddess of the sun, the great spirit who illumes the heavens, and who, in company with her brother, the moon, floats over her island empire, while 8,000,000 spirits follow her and do her bidding. No mere mortal dare address her directly in prayer, but must do so through the medium of certain inferior Kamis, who, on this account, are called *Sjo-go-zin*, protecting, helping, or watching deities.

The spiritual sovereign, or *Mikado*, is always looked upon as being descended from the goddess of the sun, through *Zin-mu-ten-woo*, and it is believed by the Sintoos that her spirit animates each successive *Mikado*. They pay him divine honours, and believe that once in the course of every year all their gods assemble round his throne. His soul is held to be immortal, and on this doctrine is founded the popular belief of a continuance of existence after death. The Sintooist aims merely, it is true, at the attainment of earthly happiness, but he has still some notion, though faint and indistinct, of the immortality of the soul, and of an after-state of everlasting bliss or misery. He has also an idea of a reward for the good and a punishment of the bad, and a conception of some place or other whither the soul goes after this life. Heavenly judges require the soul to account for its actions. The good man's portion is paradise, *Taka-ma-naka-hara*, on entering which he is admitted to the realms of the Kamis. The wicked are punished and thrust down into hell, *Neno-kuni*.

The Kami religion lays down for the guidance of all believers who desire to attain earthly happiness and consolation hereafter a series of rules, which are in substance as follows:—To serve the Kamis a man must preserve pure fire. He must cherish belief and truth in his heart, make fresh and clean sacrifices, and pray to the Kamis to give him their blessing and prosperity, and to forgive him his faults. He must also beg that the sinner's soul may be purified, in order that he may be free from every ill.

It is, therefore, the endeavour of the conscientious Sintooist—

1. To preserve pure fire.
2. To typify by the cleanliness of his body the purity of his soul.
3. To keep festivals and holy days.
4. To undertake pilgrimages; and
5. To worship the Kamis both at home and in the public temples, and to offer up to them pure sacrifices.

Purity of body and soul is the principal article of the Sintoo faith. The purity of the soul consists in doing or leaving undone what the laws of nature respectively require or forbid, and also what the laws of the state and society demand.

The state of impurity is called *Fu-zjoo*. A man may be impure from the following causes:—

1. By the death of near relations; by contact with a corpse.
2. By the shedding of blood, or merely by his being spattered with blood, and by tasting the flesh of domestic animals.

The state of impurity does not extend to persons alone, but likewise to dwellings and other places in which any defiling event has occurred.

The Sintooists signify the first state of impurity by outward signs. The men let their beards and hair grow, and cover their heads with a simple straw hat; the women cover theirs with a white cloth. This is done to keep the defiled head from the rays of the sun. The doors and windows of their houses are carefully closed, and an inscription is hung up outside, stating that the place is impure. This state of things continues for a longer or shorter time, as the case may be, and counts as mourning, the duration of which is strictly prescribed according to the degree of relationship to the deceased, and may extend from three days to thirteen months. The mourner wears a peculiar but very simple white garment. In the house of the deceased, the Gohei * is placed upon a kind of altar, and fish, and other objects which are reckoned to be clean, offered up in sacrifice. When a person is in a state of impurity of the first degree, he is not allowed to enter any temple or engage in certain rites of religion. The state of impurity of a less degree lasts for a shorter time, and it appears to be rather a mere point of etiquette than a command of the Sintoo faith, that the impure person should not enter a temple.

When a Sintooist is either really *Fu-zjoo*, or, for some particular reason, feels himself called upon to free himself from unknown spots, and attain a higher degree of purity, he retires into a solitary, recently cleansed, and, if his circumstances permit it, new dwelling. He then assumes a dress similar to that used on occasions of mourning, and remains secluded for a longer or shorter period, according as he is more or less impure, or the object he has in view requires him to do so. He carefully abstains from all nutritious dishes, especially flesh of any kind, and confines himself to a kind of rice-porridge, passing his time in prayer and the perusal of edifying books. When he is purified by such a course, he returns to his relations and friends. Priests and laymen, rich and poor, undertake these penitential ordeals. The workman, peasant, and, in a word, all who belong to the lower classes, will do so before beginning a pilgrimage or having an audience of any great person. After the prescribed time has elapsed, the house and every object that was *Fu-zjoo* are washed with water and salt, while a purifying fire is kindled in the court-yard, and the temporary recluse returns with his hair and beard shorn, and dressed in a holiday suit, to his relatives and friends.

Another important point of the Sintoo faith is the due observance of the various festivals and holy days. From the moment of his birth to the instant of his death, the native of Japan is engaged, either directly or indirectly, in their celebration. They lead him through the rolling year, reminding him, at certain months, days, and hours, of his duties towards his Kamis, his relations, his friends, his superiors, and himself. The acquirement of a proper knowledge of the various ceremonies to be used at these festivals constitutes one of the branches of a liberal education in Japan.

These festivals and holy days may be classed under the following heads:—Monthly festivals; yearly festivals of the whole population; anniversaries of the various Kamis; family festivals; lucky and unlucky days; days of prayer and penitence.

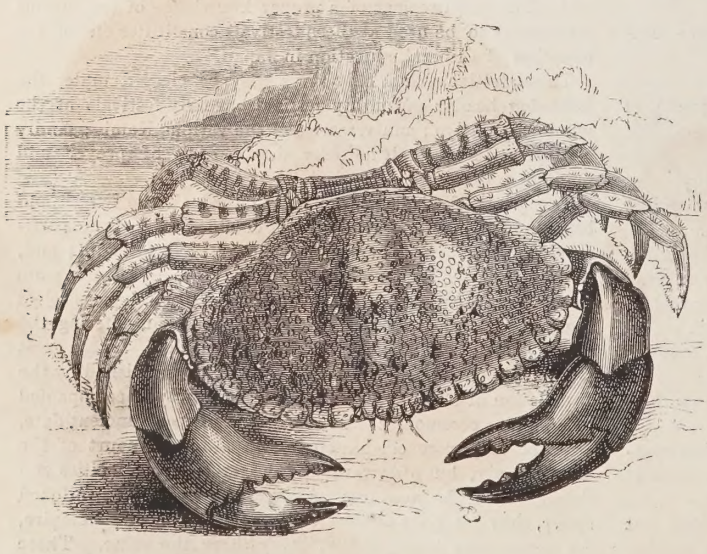
The yearly festivals are celebrated through the length and breadth of the empire, and are not confined to any one particular portion of it. They are days of rest and pleasure; and, as a heart in which joy and content reign is in a better state than when it is filled with care and sorrow, the Japanese select these occasions in preference to any other for entering the temples of their Kamis and offering up sacrifices. These great popular festivals, of which there are five, distinguished by the appellation of *Go-seki*, are, consequently, always accompanied by religious ceremonies. They are of the most ancient date. At first they were celebrated in the *Daïri* (or court of the *Mikado*) only, but afterwards in the larger imperial cities and the capitals of the provinces. At present, as we have mentioned above, they are duly observed throughout the whole empire, the ceremonies being almost everywhere the same. These annual festivals held in honour of the principal Kamis afford the youthful generation an opportunity of proving their veneration and respect for the old customs of their country.

* The Gohei is a sacred vessel formed of stripes of coloured paper, typical of some particular divinity.

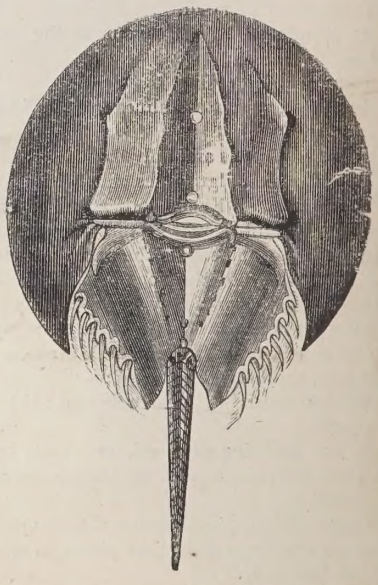
THE VIVARIUM IN THE ZOOLOGICAL GARDENS.

FEW institutions have so well deserved the success they have met with as the Zoological Society. It has, both by its meetings, its transactions, and its gardens, made us familiar with many of the wonders of creation; it has enabled the very cockney, without losing sight of his beloved London, to gaze on the riches of animated nature, to delight his eye with the plants and trees of distant lands: the whole presented to him in a beautiful and well laid out garden, which, during the last few years, has made such progress that it may fairly rank with the richest and most famed gardens of Europe; at the same time that by a liberal arrangement it is open on certain occasions, and under certain restrictions, to the humblest classes.

VIVARIUM IN THE ZOOLOGICAL GARDENS, REGENT'S PARK.

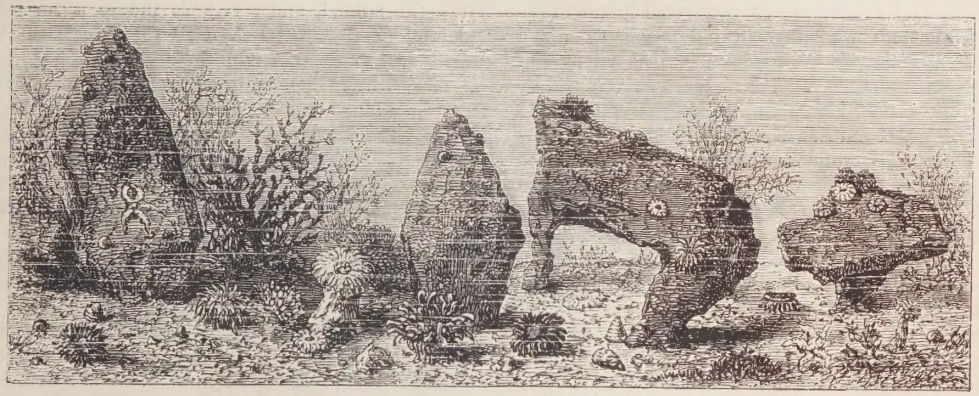


CRAB (CANCER PAGURUS).

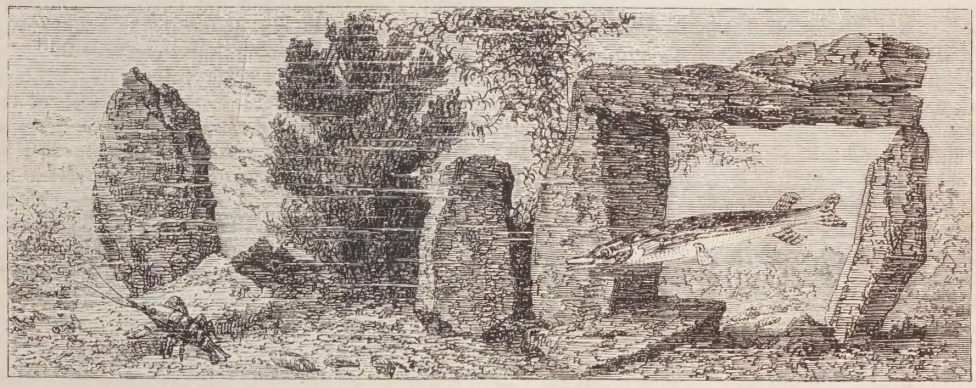


THE MOLUCCA CRAB (MINOCULUS POLYPHEMUS).

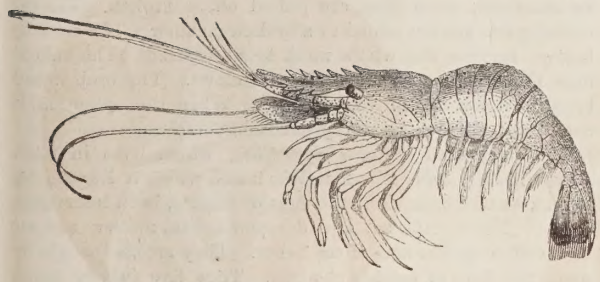
Recently an addition of great interest has been made to the institution. The wonders of the deep, the secrets of the life under water, of that semi-animal, semi-vegetable life, which is the least understood part of zoology, have been unsealed to us. Near the flower-bed of the Zoological Gardens has been rock-sand, gravel, sea-weed, and water, they are then stocked with specimens of the various beings which belong to this department of natural history. The zoophytes have hitherto been a portion of animal creation very little understood. Lesson and Dujardin, in their extensive and admirable works



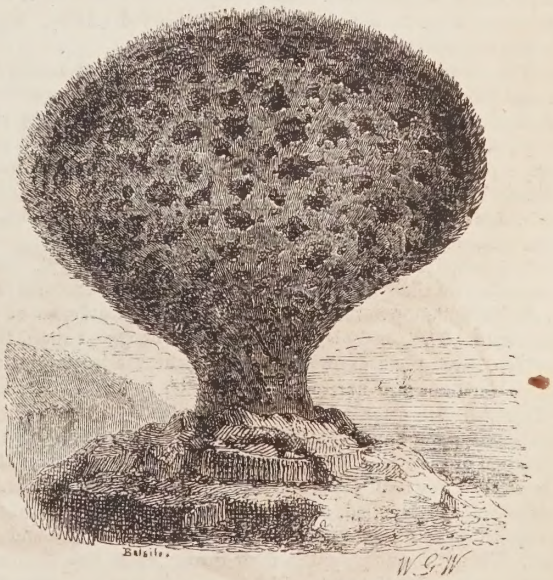
SECTION OF A TANK IN THE VIVARIUM.



SECTION OF A TANK IN THE VIVARIUM.



PRAWN (PALÆMON SERRATUS OF LEACH).



COMMON SPONGE.

erected a building, like the Sydenham wonder of the world, of iron and glass, with eight tanks full of specimens of zoophyte and crustaceous nature. It is perhaps the most curious and interesting feature in the establishment. The tanks are so arranged that we see their contents at a glance. Filled with on the subject, confess that it is almost a new department of science. Until the commencement of the present century scarcely anything was really known about the matter, and the division of the zoophytes into classes is yet an arbitrary affair which it will require more complete inquiry to settle

finally. Some confusion will at first exist in the mind of the student of natural history, through the different views of its professors. But the time is not far distant when even this department of science will be bound by the same rigid rules which have been applied to others.

The reason why any knowledge of this department was necessarily vague and indistinct will readily be found in the difficulty of the study. The zoophytes could only be examined in their natural element, on the occasion of long voyages at sea, or by spending whole days on the banks of rivers and by the sea-side. These animal-plants could not be preserved, could not be kept; at least, the means of so doing had not been discovered. This part of the difficulty has been obviated by the indefatigable industry and perseverance of the secretary of the Zoological Society. We find the tanks plentifully supplied with specimens of zoophytes, with crustacea, star-fish, fish of the genera, Labrus, Cottas, &c. They live before our eyes, move, eat, and are eaten. The actinia and the pecten call attention, the former by the brilliancy of colours and his abundant tentacles, and the latter by his peculiarly shaped open valve. To describe the contents of the tank would be impossible, they are so numerous and varied. They are of English origin. They have long excited attention in Scotland; and Sir John Graham Dalyell, in his "Rare and Remarkable Animals" of that country, speaks of them. The department as yet most complete is that of the actinias. The tank in which they are contained present a very remarkable appearance, from the variety and richness of the colours. The crustacea are a very interesting feature in the adjoining tank. The whole has somewhat of the effect of the kaleidescope, the contents of every tank being in perpetual motion. Both the scientific and the unscientific may be interested and instructed by a careful examination of the Vivarium.

The zoophytes are the most imperfect of animals, a kind of connecting link between a sloth and a lump of sea-weed. Their nervous system is either elementary or non-existent, and they have no organs of the various senses. They differ from other animals in the circumstance that the body diverges star-like from a centre; hence their name of *Radiata*. Those who have seen them on the rocky sea-shore, spreading out their membranes, or clinging to each other in masses, must at once be struck by their resemblance to a flower, or even to a bush with many ramifications. They have in times past been confounded with an immense class of sea-weed (*Algæ*), which much resembles the zoophyte creation.

The common sponge (p. 221) has been included among the zoophytes, it being a doubtful substance found on submarine rocks. This substance, of a glutinous character, is in part composed of transparent and spherical globules, which produce *ovoïdes*, which at times are expelled from the mass. These bodies, which move and have an almost imperceptible life, reproduce the sponge, which thus becomes entitled to the name of a zoophyte.

The principal class of zoophytes is that of the polypi. These animals owe their name to the tentacles which surround their mouths, which give them a resemblance to the polypus of the ancients. Their body is cylindrical or ovular, and there is no orifice, save at one extremity; their structure is simple, and their faculties are narrow in proportion to their simplicity. Nearly all are attached to extraneous bodies by their lower extremity, and have no motion beyond the extension and contraction of their tentacles, and of the anterior portion of their bodies. They multiply sometimes by means of eggs, which are detached and expelled, to fix and attach themselves elsewhere; sometimes by excrescences, which grow on the body and fall off. These become polypi in their turn. From this results an aggregation of individuals which seem to live of a common life, as if it were a composite being with one mouth and a thousand bodies and stomachs. Though these stomachs do not open one into the other, there is a vascular communication by which the alimentary matters digested by the one serve for the nutrition of the others.

The bodies of the polypi are often composed of semi-transparent tissue, but with most the lower portion of the tegument becomes hard and petrified. The solid wrapper varies in its form, and represents so many tubes, or so many cells. These polypi, by congregating together, form vast masses, which rise into rocks and shoals in the tropical seas. They rise one upon the other from the bottom of the sea. The stony bark, with which each individual incrusts the lower part of its body, survives the animal, and serves as the basis for other polypi. Generations thus succeed, until they reach the level of the water. All those that find their way above, perish, and the soil formed by their remains ceases to rise; but this soil, which forms on a level with the water, becomes a sunken rock most dangerous to navigators. This draws around remains of vegetables mixed with sand, which form a soil favourable to the development of plants; then, wafted on the waves, come ligneous and herbaceous seeds, which germinate, mingle their roots, and then increase and multiply in this virgin soil, which in a few years is covered by luxuriant vegetation. These islands at last become habitable, and man soon takes possession of them.

The class of infusory zoophytes is composed of animalcules, which are developed in abundance in water where vegetable or animal matter has been infused. Their bodies, round or long, contain in the interior a great number of little cavities which appear to fulfil the functions of a stomach. This has given to them the name of the Polygastric infusories. Their mode of multiplication is doubtful. It would occupy volumes to describe the multitude of these creatures.

Crustaceous animals begin with crabs, lobsters, &c., and go down with some naturalists to the leech of the surgeon. They are articulate animals, which have heart and gills to breathe with in the water. The lowest order are ranged among the intestinal worms. The crustacea have bodies divided into rings, sometimes moveable, sometimes solid. Their tegumentary skeleton presents a strong consistence, due to a very considerable proportion of carbonate of lime. This crust, which has given them the name of Crustacea, is a skin in reality. At certain periods it is detached and falls, as the skin of serpents and the tegument of insects do. We shall allude more fully to this characteristic hereafter.

The head is sometimes free, sometimes fastened to the thorax. This latter supports the head, the pair of feelers, and the mouth, which is adorned with numerous appendages, some of which are regular claws, that serve as a defence against the elements, and aid the progress of the animal. The crab given in our engraving (*Cancer pagurus*) is the one usually consumed by lovers of crustaceous food. It weighs sometimes as much as five pounds. This is the species which reproduces its members, when they are pulled off or broken. The renewed parts are not added to a broken member. If a claw be broken in two, the whole must be extirpated. The animal does this itself, generally using its claws. The crab would bleed to death but for this process. When the operation is completed, the process of reproduction commences.

The river crab (*Astacus fluviatilis*), which lives in fresh water, hiding under stones and in holes, which it leaves only to feed on molluscæ, fish, and eggs of insects, is an interesting study. These crabs eat also decayed animal matter, and are thus caught in the nets of the fisher. They are also caught by using the flare of torches at night. They live twenty years, increasing in growth every year. The female collects her eggs round the false claws, and the young crabs hide beneath their mothers while their shell is hardening.

The period of changing the shell is one of importance to the creature. It is a laborious, painful, and often a fatal operation. By putting a crab in a glass, at the proper season, it can be studied by any one. Some days before it throws its tough skin, it ceases to eat, and the shell begins to detach itself from the body, which becomes loose or thin. The crab begins to rub its claws together, turns on its back, moves its tail, swells its body up, and splits the shell. Then, swelling certain parts of its body, it draws its head back, loosens its eyes and large and small claws, and by a sudden jerk gets out of the shell. The operation is often fatal, but, if successful, the new shell is formed in twenty-four hours.

J. J. BOISSIEU.

When Jean Jacques de Boissieu was born at Lyons, in 1736, affectation and conventional laws predominated in the fine arts as they did in the higher classes of society. It was the epoch of paint and powder, of hoop-petticoats and beauty-spots. Watteau had been dead for fifteen years; Pater, his disciple, died in 1736; but Lancret, his other pupil, still continued to produce lackadaisical coquettes; and Boucher soon after rendered fashionable a *genre* which was as fatal to art as it was to morality; while Dorat, Bernis, Colardeau, Bernard, and the Chevalier de Parny, soon became followers, in poetry, of the same school. All elevation of mind seemed to have disappeared. The age of Louis XIV. had seen the study of nature neglected for the imitation of the ancients; and the eighteenth century substituted the caprices of the imagination, and the fancies of civilised corruption, for the study of the ancients. Whenever man once wanders from the truth, he always plunges, by necessary and unavoidable progression, deeper and deeper into error. But yet, whatever ascendancy the evil may gain, it never succeeds in corrupting all the citizens of a state. A secluded life protects some from its pernicious influence; mental vigour, originality in ideas, and force of character guard others; while a few owe their safety to the artless sincerity with which they follow their inclinations, and allow themselves to be guided by their own inspirations. It is among the last that Boissieu must be ranked. He belonged to an old and noble family which came from Auvergne. His paternal grandfather, Jean de Boissieu, had been secretary to Marguerite de Valois, and was appointed her executor when she bequeathed her property to Louis XIII. Boissieu evinced great aptitude for his calling at a very early age. We are told by one of his biographers, that "Monsieur Vialis, his maternal uncle, possessed some very fine pictures, which Boissieu used to attempt to copy, even before he had received any lessons in drawing; and these first trials of the young artist announced his innate talent."

Boissieu's decided predilection for the fine arts was a source of great annoyance to his parents, who wanted to make a magistrate of him. They placed him, however, with a painter of the name of Lombard, who soon taught him all he knew, that is, very little. Boissieu required a more talented master; but Frontier, with whom he was now placed, was, like Lombard, soon surpassed by his pupil. Boissieu was, therefore, obliged to apply to the princes of the pencil for the instruction of which he stood in need. The works of Ruysdael, of Berghem, of John Miel, and of the brothers Both, henceforth became his preceptors. His imitations met with great success; and a drawing executed by the young artist after a picture by Wouvermans, having been sold at a sale for a thousand crowns, his parents began to waver in their obstinacy. Besides which, as Boissieu led a most exemplary life, and evinced none but the noblest of sentiments, they thought, at last, that he could be trusted to his own guidance. He consequently set out for Paris, where he had long wished to go, in order to improve himself. He was now in his twenty-fourth year.

Though it would not have been astonishing for Boissieu, now that he was in the capital, to be led astray by the paltry style and false taste of the reigning school, yet such was not the case. Rich enough not to be obliged to sell his works, and too modest to court public approbation, he neither troubled himself about fashion nor success, but pursued his profession for the love he bore it, for the sake of exercising his imagination, of satisfying a moral want, and of procuring himself intellectual amusement. He did not even require to be put on his guard against the false theories or the licentious and affected style of the epoch. Without attempting to emulate them, he studied those masters who pleased him, took advice of nature, and followed the dictates of his own sentiments. But it was wholly because his style differed from the one which was in fashion, that his paintings were so quickly noticed. Connoisseurs appreciated their merit, opened their galleries to him, and permitted him to copy whatever he chose. Monsieur Tolosan, who came from the same place as himself, was among his admirers; and the most celebrated artists of the day were not less eager to do homage to his talent. Vernet, Soufflet, Watelet, and Greuze sought his friendship, and prized the possession of his drawings. No one, however, showed him more affection than the Duke de la Rochefoucault, and it was not long before they formed a most intimate acquaintance with one another. One day, this amiable nobleman made Boissieu the proposal to undertake a journey to Italy. Boissieu willingly accepted the offer, but as the duke could not fix any time for their departure, the artist went on as usual with his studies.

To-day he copied the compositions of the great masters, and to-morrow he wandered into the environs of Paris, to sketch the finest views he met with in them. The forests of Marly, of St. Germain, and of Fontainebleau, became his studios, in which nature provided him with an unlimited number of beautiful models. The surpassing majesty of the old trees, the juvenile grace—if we may be allowed the expression—of the underwood, the capricious forms of the thickets and the briars, the old stones on which arabesques were traced by the moss that grew there, the deep glen-like roads full of wild mint, the perspectives which the fog slightly tinged with blue, the tall avenues, and the hilly land, delighted his mind and employed his pencil alternately. On his return to his native place, he took with him a great number of studies, which afterwards enabled him to enrich his etchings with a thousand valuable details.

It was at this time that he made his first trials in engraving. A picture-dealer brought him one day some copper-plates already prepared, and asked him as a favour to make some drawings on them. Boissieu set to work, and thus accidentally commenced the profession in which he was destined to meet with such unlimited success. These first etchings were, of course, imperfect, but they yet bespoke the great and original talent of the artist.

The Duke de la Rochefoucault having at last found time to set out on his tour through Italy, went to Lyons, in 1765, to fetch Boissieu, and they immediately hastened to cross the Alps. Both of them experienced great pleasure on beholding that celebrated country in which so many *chefs-d'œuvre* are embellished by so soft a light, and where the productions of nature are not less attractive than the works of man. Whenever they met with a view that pleased them, Monsieur de la Rochefoucault stopped the carriage, so that Boissieu might make a sketch of it. Florence, Rome, and Naples were the three cities in which they made the longest stay. The young artist sketched the arch of Titus, the Colosseum, the tomb of Cecilia Metella, the cascades of Tivoli, and the ruined house of Mecænas. He formed an acquaintance with Winkelmann, who then lived in the palace, and under the protection, of Cardinal Albani. The impassioned admirer of the Greeks and Romans thought he had found a disciple in Boissieu, for the painter listened to his arguments with the greatest attention; and, perhaps, Boissieu himself fancied that he was become a convert to the somewhat exclusive ideas of the archæologist: but, on his return to Lyons, he did not the less continue to imitate the Flemish painters, both in respect to subjects and to colouring.

As Boissieu was determined that want of care should not hinder him from equalling his models, he ground his colours and prepared his varnish himself. But the fatigue attendant on continual application soon proved too much for his weak constitution, and he fell dangerously ill. He was, therefore, obliged to give up painting in oil. From this time, he only worked on wash, lead-pencil, and red chalk drawings, and on etchings, but he executed all these with the greatest talent. "His red chalk portraits," says Monsieur Dugas Montbel, "are finished in a manner which belongs only to him, and which has as yet found no imitators; his lead-pencil land-

scapes also soon attained the greatest celebrity." The Count d'Artois and the first noblemen of the court eagerly sought after al his new productions, and foreigners were not less desirous to obtain them. England, Russia, and northern Germany, neglected nothing in order to procure them. But

ETCHINGS BY BOISSIEU.

this was somewhat difficult to achieve, for Boissieu did not sell his productions. Monsieur Artaria, of Manheim, who carried on a large trade in objects of art, could only obtain them by purchasing them second-hand, or by presenting the artist with valuable pictures in exchange for his own.

He thus lived without ambition, trouble, or regret, till the time when the French Revolution broke out. The passions of the epoch exercised, however, no influence on his heart. While France was giving birth to a new state of society, and suffering the pangs of maternity, Boissieu fled from the noise of con-

ETCHINGS BY BOISSIEU.

In 1772, when he was twenty six years of age, he married Mademoiselle Anne Roch de Valoux, a native, like himself, of Lyons. So mild and steady a man as Boussieu was, necessarily made a good husband: his marriage was, therefore, a very happy one, and in no way changed his mode of life. Incessantly occupied with his art, he now made use of the

tention to seek the calm pleasures of solitude. But misfortune overtook him in the country, where he had lived in retirement for twenty years. An artist, who was a member of the Convention, was sent to the banks of the Rhone for the express purpose of protecting his life; but Boissieu lost his fortune; and his eldest son, who was compelled to flee the country after

the siege of Lyons, died in Switzerland from the fatigues of his journey, and doubtless, too, from the grief caused by his exile.

Boissieu earned sufficient by his pencil to supply his wants; and when the nation had recovered itself enough to enjoy the pleasures of the imagination, the Institute of France, the Academies of Bologna, of Florence, of Grenoble, and of Lyons, appointed him one of their corresponding members. But, in spite of the entreaties of M. Denon, he could not be prevailed upon to quit his province for the more brilliant abode of Paris.

scenes with which they are surrounded. His own portrait, too, confirms these indications; *finesse* is there joined to vulgarity; the cheek-bones are prominent, the nose big, the lips thick, the lower part of the forehead fleshy, and the chin large; but the eye is full of observation and shrewdness, though devoid of noble expression. The face, however, wants that dignity which is the characteristic of a superior mind. The personages met with in his works have, perhaps, still less nobleness, and fewer signs of intelligence about them. The monks in the choir; the children blessed by Pius VII., with

PORTRAIT OF BOISSIEU, DRAWN AND ENGRAVED BY HIMSELF.

Old age did not diminish his talent; for his last engraving is one of the finest he ever executed. He died in the possession of all his force of mind, on the 1st of March, 1810, at the age of seventy-four. For some time past, he had with difficulty borne the severity of the winters; and the cold of 1810 penetrated to his very heart.

The works of Boissieu seem completely to reveal his Auvergnian origin; in them you discover patience, and rather a heavy character, but, at the same time, that true love of nature which is imparted to all mountaineers by the beautiful

the woman who has brought them, and the acolytes placed in the back-ground; the fathers of the desert; the little boys playing with a dog; the professor of botany and his pupils; the family before the fire; and several other personages, carefully drawn, surprise you in a disagreeable manner by the common and inert expression of their features. Such lethargic and insignificant-looking faces constitute a defect which will not be found, perhaps, in the works of any other celebrated painter or engraver. This defect spoils the pleasure which the talented and fine execution of the artist pro-

duces. A few heads, on the contrary, possess features of a most lively expression: the two children, for instance, who are looking at a flute-player; those who are amusing themselves by blowing bubbles; the portrait of Boissieu's brother; a three-quarter male figure; and two others in the print where a man is being shaved, surprise you by the boldness of their relief and their animated appearance. Such, too, is the old rogue with a cap nearly reaching down to his shaggy eye-brows, beneath which his suspicious-looking, penetrating, and perfidious eyes assume a formidable expression. Yet these same heads, which are so striking in appearance, and so admirably executed, are void of nobleness and grandeur, and no reflection of a single elevated sentiment is perceptible in them. Observation, *finesse* and cunning, are all that the engraver has been able to represent; and these form, in his eyes, all the phases of moral life. His "St. Jerome in the Desert," for instance, is writing very attentively, but no inspiration is there to light up his look, or to impart any appearance of idealism to his features. The landscape, which is rigidly beautiful, possesses more expression than the face of the saint; and the man is thus rendered inferior to the inanimate objects by which he is surrounded. Boissieu, it is evident, lived too much in solitude and sought too much after calm: it is necessary for the artist, as well as for the poet, that he should himself attentively study the workings of the higher passions, which are to be met with only in the bustle of active life. Goëthe himself, in consequence of keeping continually out of society, lost, at last, the vigour of his brilliant days; and finished by writing works almost void of sense, and full of chimerical visions.

Boissieu was more successful with nature than he was with the human face. His landscapes are very fine: in them vigour is joined to delicacy, and elegance to truth. The drawing is always full of energy in the *tout ensemble* and of *finesse* in the details. Here we see the beautiful effects of light and shade bringing out every object in bold relief, while in another place are seen fugitive lights, carefully managed gradations, and backgrounds of the most exquisite lightness. No trace of negligence or of hurry is anywhere to be discovered in them; but everything is, on the contrary, of the most perfect finish. The foliage of the trees, the movement or the motionless splendour of the water, the canals, the forms of the land, the winding or broken lines of the rocks, and the magic of the perspective are all represented in the most successful and varied manner. A few artists have reproached Boissieu with having exaggerated the brilliancy of the light parts of his foliage to such an extent as to produce the effects of snow: this defect, however, can hardly be said to exist except in the bad copies, in which the details of the light parts have disappeared. It must be owned, however, that Boissieu was not always successful in the execution of his clouds, which might often be taken for mere daubs instead of moving vapours.

But though the works of Boissieu are open to certain criticisms, he himself is none the less on that account the greatest etcher that France ever produced. His drawings are executed in such perfection, that many of them are as valuable as oil paintings, and some of them have even been sold for £120 sterling each. Though they are all characterised by such wonderful delicacy in their execution, Boissieu yet worked very quickly. A skilful draughtsman of his time, having seen him work, was thoroughly astonished at the rapidity with which he completed everything he began; the artist in question did not think it possible for so perfect a finish to be obtained with such promptitude, and was seized with a fit of discouragement, which lasted him a fortnight.

Boissieu also painted some pictures of subjects similar to those painted by Ostade; but he owes all his fame to his etchings, which he executed in so masterly and picturesque a manner. The number of his plates is, according to M. Duga Montbel, a hundred and seven, which are generally marked D. B., with the date. Monsieur Guichardot, who has studied the works of the celebrated engraver more than any one else possesses, or is acquainted with, a hundred and forty-two o his prints; and as this gentleman has devoted forty years o his life to the works of Boissieu, his opinion ought to be taken as an authority.

The following are among the engraver's best prints:—

"An Old Man, with a Boy Reading," in the manner o Rembrandt.

"A Cooper working in a Cellar;" after the same.

"An Italian Landscape, with Women washing."

"A Landscape with Shepherds by the water-side;" afte Berghem.

"A Forest with a Cottage, and a Man on Horseback, wit Peasants."

Another "Forest Scene," the companion to the above.

"A Landscape with Figures and Animals, having in th middle a Hill, on which is a Cross and an Old Man kneeling.

"A View near Zurich, with a Man and a Woman mounte on a Mule, and driving Cattle through a rivulet."

"The Quack Doctor;" after C. du Gardyn.

"A Landscape with Figures in a Boat, and a Mill;" afte Ruysdael.

"The Great Mill," a charming landscape; after the same.

"A Mountainous Landscape, with a Waterfall;" afte Asselyn.

"A Grand Landscape, with a Hermit at the entrance of Cavern," 1797.

"A pleasing Landscape with large Figures, and two Cow standing in the water."

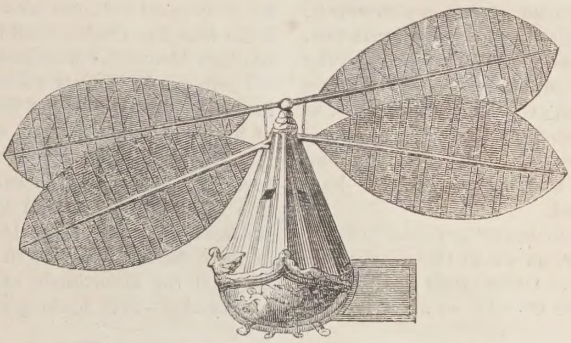
BALLOONS AND BALLOONING.

In the advance of mankind, all things, even apparent obstacles, promote incessant progress. Expressions of doubt in every form, the host of sceptical and envious men, favour that improvement which they gainsay; plagiarists extend its influence while they render its effects popular; everything conduces to progress.

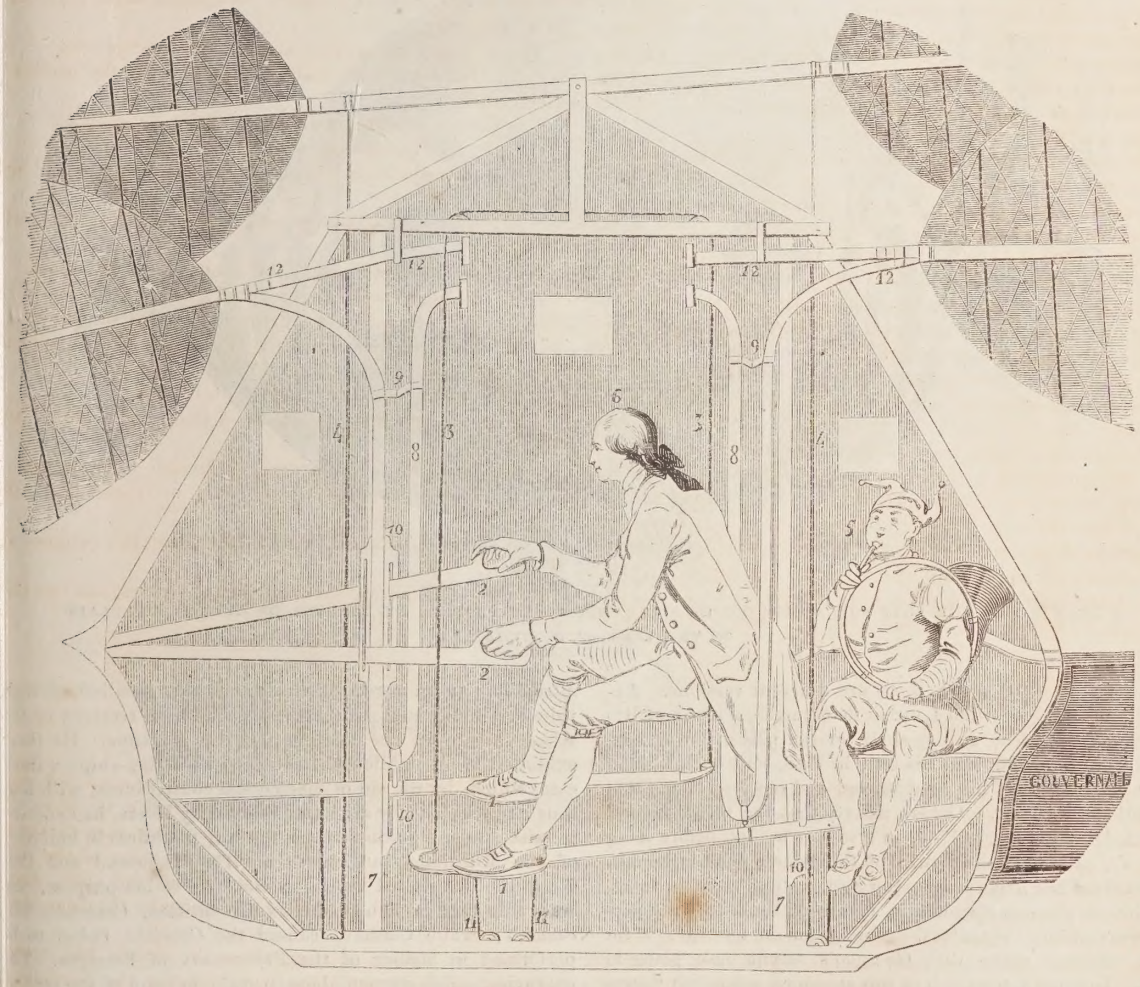
The germ of those successive discoveries, which men of genius from age to age disclose, and which each generation develops, existed from the beginning of time. When the veil which covered them is drawn aside by the skilful or fortunate hand of one of real genius, numbers of envious spirits, anxious to darken the rising glory, ransack the dreams of the past, which turn out sometimes to be the foreshadowing of the future. They there seek to prove that the idea which has just arisen is not new, that the progress is illusive. The man whom they lately admired, far, in their opinion, from meriting universal gratitude, has only meanly attributed to himself the merit of another, by bringing to light the invention buried by an unknown scholar in some old worn eaten book. These efforts, these struggles to deprive th inventor of his legitimate reward, his glory, may darken ar disturb his life, but cannot silence the echo of the divi word, of which the man of genius is but the voice, and, i spite of the envious, the future will recognise the name of suc discoverer.

The first balloon darting above the clouds had scarce imposed silence upon those who, denying the possibility ascending into and traversing the air, taxed with folly th attempts made for this purpose, than these same peop hastened to assert that the discovery was not new. The secr of flying through space was known to the ancients, said they Icarus, the magician of Thrace; the prophets transported heaven; Simon, the sorcerer; fable and history, down Cyrano, of Bergerac, and his ingenious projects for travelli across the moon and the sun, were brought forward and s in opposition to the young aeronauts. These forerunner

however, were strange rivals ; envy could not content herself with them, and brought to light the rare and unknown work of Père Lana. This Jesuit spoke of aerial navigation as a scientific amusement ; the flying ship which he described was surmounted by four spheres of thinner copper (he specified the thickness) than had ever been seen before. To produce



EXTERIOR OF BLANCHARD'S FLYING SHIP.



BLANCHARD'S FLYING SHIP. *

e vacuum which was to lighten the boat, the good father vised filling these spheres with water, which was to be let off by turning the taps and promptly turning them back. The process, as may be seen, was simple. This pleasantry, which appeared in print at Brescia, in 1670, a few years after the death of Pascal, and which was founded upon those ideas which had given rise to the experiments of this great man upon the weight of the air, was seriously brought forward as the origin of the invention of balloons. Then they spoke of Galien, a Dominican monk, the author of

* 1, Pedals in the form of levers of the second kind ; 2, Plyers in e form of levers of the second kind ; 3, Connecting lines which ise the pedals alternately ; 4, Cords which serve to move the ading wings ; 5, Travelling companion ; 6, Pilot ; 7, Posts which pport the top ; 9, Supporting ropes which move the wings by means of the pedals ; 9, Connecting strings to prevent the separa- of the ropes ; 10, Slides which prevent the displacement of the pedals and plyers ; 11, Connecting cords which are attached under the pedals, and pass under the pulleys at the bottom of the keel ; 12, Principal appliances for trimming the sails.

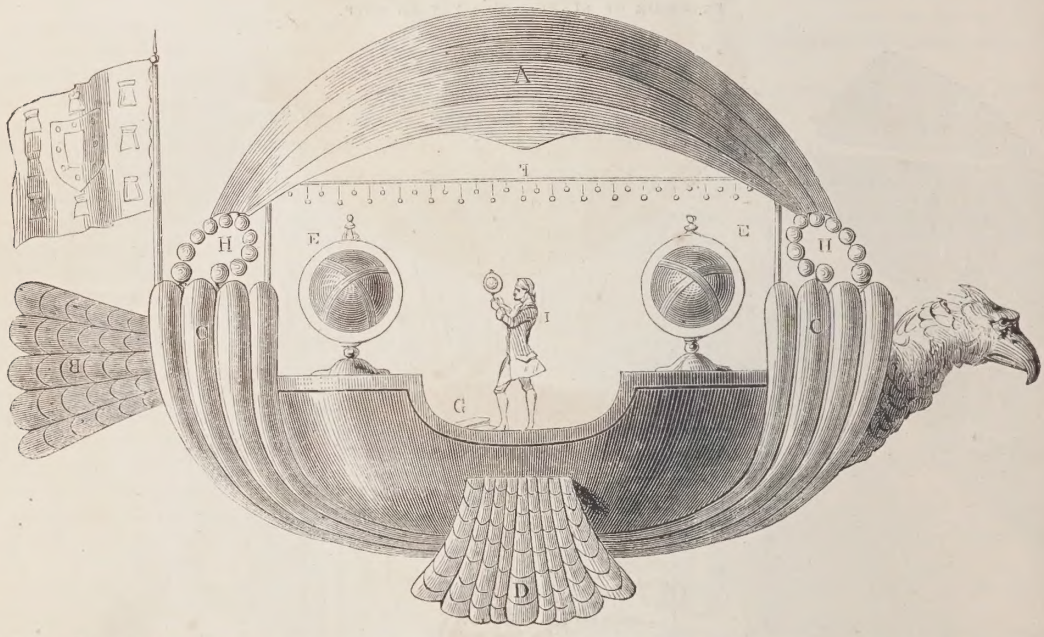
a pamphlet as little known as the work of Lana—a book in which, among other physical and geometrical amusements, was described an immense cubical vessel, measuring above 1,350,000,000 fathoms, longer and broader than the town of Avignon, weighing 12,000,000 cwt.—a weight, the monk affirmed, ten times greater than that of Noah's ark. To raise this gigantic machine above the clouds, Galien, giving to the side of the ship a height of more than 113 fathoms, in order that the lower strata of atmospheric air might not penetrate it, filled it afterwards with rarified air. How to procure this, how to stow the etherial fluid, was a subject upon which the speculative monk had never felt any uneasiness. There was nothing practical, nothing possible, even in his own eyes, in this play of his imagination. These were the mere hypotheses of an intelligent, learned, solitary man, who, though taking pleasure in his dreams, had not an idea that even the least part of them would ever be realised.

These precursors had no power to detract anything from the glory of the brothers Mongolfier, or cause the genuineness of their discovery to be doubted. Other rivals were sought for, and then came the story of the *Ovoador*, or flying man—a confused legend, of which there are different versions. According to some, a certain Laurent de Guzmao, a monk of Rio Janeiro, having seen an egg-shell, or the peel of an orange, float before the window of his cell, in 1720, sent off a balloon to the amazement of his companions, and received from them the title of *Ovoador*. Others assert, that the monk himself ascended, at Lisbon, in 1736, in a wicker basket, before King John V., as high as the cornice of the palace, whence he fell. He received his name by popular acclamation, and his death, which took place in Spain, was, it is said, caused by the persecutions of the inquisitors. The dates do not agree; for other accounts affirm that Guzmao's ascent took place in 1709. To confirm the truth of this anecdote, a Spanish manuscript was quoted, which is neither to be found in the archives of Paris nor in those of Turin, in both which places it was pretended to have been seen. The engraving below, taken from the library of the Rue Richelieu, in Paris, the only trace which we have met with of the pretended invention of Guzmao, we reproduce in all its strangeness, with the annexed explanations.

This dream seems even more fantastic than those of Lana and Galien. The truth is, that the imagination was more and more occupied with the idea about to be realised, and many looks were fixed beforehand upon those new routes which the brothers Mongolfier were preparing to lay open to all.

Further experiments were made, and wings were brought into use. The Marquis of Bacqueville set sail from a window of his hotel upon the quay, and alighted upon the boat of a laundress in the river. The Prebendary Desforges, of Etampes, invented a carriage which was intended to fly; but, in proportion as he rapidly moved the wings which were to raise it, the heavy machine seemed to sink into the earth. The history of these failures appeared in verse; vaudevilles and mockery followed the unfortunate experimenters, as if to discourage imagination—that harbinger of genius. Blanchard, whose intrepidity as an aeronaut was afterwards admired, though ridiculed for unsuccessful attempts, had been received by the Abbé Viennoy in his hotel in the Rue Taranne. He there exhibited to the public what he called his flying-ship—a lined case, which, by the aid of mechanical contrivances, with four sails, ten feet long by six broad, moved by levers, he expected to raise into and guide through the air, doubtless in imitation of the Musulman magician, in "The Thousand and One Nights." Blanchard remained steadfast to his purpose, and was ridiculed in a bad vaudeville, entitled, *Cassandre Mecanicien;* while Cailhava caused the *Cabriolet Volant* to be performed in honour of the Prebendary of Etampes. The engraving which we reproduce (p. 227), in spite of the serious explanations which accompany it, must be a caricature, to judge from the singular personage, dressed in a fool's cap and bells, who strikes up a flourish in the ears of the inventor.

These experiments of Blanchard took place at the end of 1782. In the same year, Etienne, one of the MM. Mongolfier, in his private correspondence, had communicated to M. Desmarest, of the Academy of Sciences, the invention of the balloon, which the two brothers, Etienne and Joseph, then called a *diostatic* machine, because it sustained itself in the

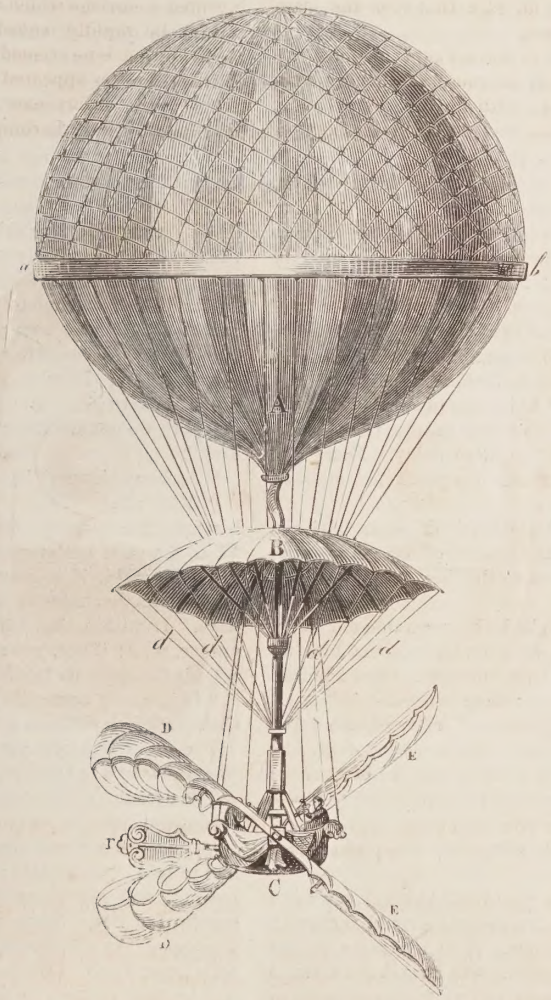


A DRAWING OF THE BOAT FOR ASCENDING INTO THE AIR, INVENTED 1709, BY LAURENT DE GUZMAO, CHAPLAIN TO THE KING OF PORTUGAL.*

* A, Sails to sustain the boat; B, Rudder; C, C, Bellows to supply any failure of wind; D, Wings to support the machine; E, E, Magnet, enclosed in two globes of metal, attracting the body of the boat lined with plates of iron; F, Iron wire, upon which are hung a number of pieces of amber to attract the matting of rye-straw which carpets the interior of the boat; G, Mariner's Compass; H, H, Pulleys to let fly the sails; I, Space for ten travellers and the pilot who directs the manœuvres.

air. In spite of the perspicuous and clear explanations of the inventor, and perhaps on account of their perfect simplicity, the academician understood nothing about them, and replied, "As I do not understand your ascending machine, I have not been able to make any use of all you have told me about it at different times." Probably he classed this invention in the category of delusions so common to that epoch.

Shortly afterwards the discovery became generally known by the experiments of the 5th of June, 1783, made in the presence of the deputies of the state of Vivarais. The idea, so simple in its grandeur, was too easy of application not to find many imitators, and Blanchard was one of the first. But the mechanist sought in his various ascents to make use of his



THE FLYING SHIP. THE FIRST EXPERIMENT WHICH BLANCHARD WAS TO HAVE MADE, MARCH 2, 1784, FROM THE CHAMPS DE MARS, ACCOMPANIED BY DOM PECH, A BENEDICTINE MONK.*

former mechanical contrivances; thus, on the 2nd of March, 1784, he prepared to depart from the Champs de Mars, in the balloon which he called his flying ship, to which he had attached six wings.

Blanchard and his companion Dom Pech, a Benedictine monk, were prevented from ascending in the balloon, such as it is represented in the engraving. A pupil of the Military School, named Dupont de Chambon, was obstinately bent upon setting out with the travellers; repulsed by them he forced his way, sword in hand, into the gondola, wounded Blanchard, tore the rigging, broke the oars or wings, and the aeronaut was reduced to the necessity of ascending alone some hours later, by the usual means, after having mended his balloon as well as he was able.

Blanchard might have learnt from the inventors the useessness of the oars which he endeavoured to employ in several subsequent ascents. The brothers Mongolfier had considered, among many other means of guidance, the use of oars, and had rejected them. Joseph wrote to Etienne towards the end of the year 1783:—"Pray, my good friend, reflect, calculate well; if you employ oars, you must either make them large or small: if they be large, they will be heavy; if they be small, you must make them move with the greater rapidity. Let us make the estimate on a globe of a hundred feet in diameter." After having made this calculation, he arrived at the conclusion that the power of thirty men, exerting themselves so that they could not keep on fifty minutes without resting, would not suffice to make the balloon go six miles an hour. "I do not see any efficient means of guidance," continues Joseph, "except in the knowledge of the different currents of air which it is necessary to study; they generally vary according to the elevation." This idea, common to both the brothers, often recurred to their minds.

* A, Aerostatic globe filled with inflammable air, and attached to the hoop, *a*, *b*; B, Parachute, the ribs of which are secured to the axis, or stick, by the strings *d*, *d*, *d*; it is not intended to sustain the machine in the air, excepting in case of an accident happening to the globe, when it serves to break the violense of the fall; C, Boat, carrying the travellers, suspended and fixed to the axis, or stick of the parachute; D, E, Oars moved alternately by the travellers; F, Rudder.

THE DEAD BRIDAL.

CHAPTER XV.

How sweet and refreshingly, after the noontide heat of a summer day, does the sea-breeze blow in upon some long, low strand, where no tree spreads its shadow-flinging branches against the sunbeams!—with what a grateful coolness do the odour and moisture of the briny air fall upon the senses! Have you ever, readers mine, lay upon, or walked along the sea-beach just at that time of day when the sun is westering half-way between the zenith and the horizon—that time when scenery, whether of the earth or the ocean, looks so distinct and tint-marked? How beautiful are the purple and the brown of the hills! how sparkling and white the naked and scarred cliffs! how the long shadows of the dim headlands shoot out far into the water, and the tempered light of the sun comes aslant upon the sails of ships, and makes them shine white as the wings of the swan!

Just at this hour of the day which succeeded that on which the spy was captured, three persons loitered along the shore at Palestrina, a short space beyond the fortifications. Now pausing a moment to look upon the galleys of the Venetian republic, which lay upon the peaceful bosom of the Adriatic, just before the mouth of the Porto di Chioggia; now pacing slowly along the sand northward, and gazing from time to time towards the region of the horizon where the distant city of Saint Mark lay reposing amid her watery highways. But other thoughts than the freshness of the air or the beauty of the sun-tints occupied them. Their heads and their hearts were busy with the schemes of life. The anxious cares, the hopes, the fears, the turmoils, the jealousies, which ever trouble the peace of rulers, as the shadow troubles the sunshine.

"So please your highness," said one of the three, "my counsel is that there should be no more delay. Every day that this siege is protracted increases our perils and adds to the burdens of the state."

He who spoke was a dark and gloomy-looking man, with a black gown—the member of the Council of Ten whom the jealousy of the state had assigned to the doge as his nominal adviser but real controller.

"What you say, signore," replied the venerable old doge, "is but too true. Nevertheless, we must be cautious how we act in opposition to the views of both our general and admiral. The state reposes much confidence in those her well-tried sons."

"The state, so please your highness," retorted the other significantly, "does so indeed; but, like a wise parent, she reserves to herself to decide upon what is best for her honour and weal, while she expects her sons to respect her counsels and to obey her mandates."

Conturini looked at the dark visage of the speaker, and bowed in dignified silence.

"It seems to me, if I may be permitted to speak my mind freely, that your highness and the council should forthwith decide upon more active measures. The overtures of the Genoese have been rejected. Despair will now impel them to a final effort, for they may as well sell their lives dearly in battle as surrender them bootlessly. If we now turn this siege into an assault, we shall take the enemy by surprise, and terminate this tedious and dispiriting warfare,—if warfare, indeed, it can of late be called."

"And how say you, signore?" asked the doge, turning to the person on the other side.

"As your highness seeks my opinion," said the senator, after he had exchanged a glance with the member of the Neri, "I fear that the risk of a speedy assault is less than the peril of continuing this blockade. Scarce a day comes that some tumult or discontent does not arise amongst the foreign soldiery: how long our own may remain uninfected, who can tell? It is rumoured, too," he added, lowering his voice to a whisper, "that even our general has not been unassailed by temptation."

The old doge started, and his eye kindled with somewhat of its youthful fire.

"It is false, signore!—by my life and honour, it is false!"

"Nay, your highness will not understand me as saying it is true; yet the tale goes that large sums have been offered to him from Genoa."

"He would scorn the bribe and spurn the briber. The noble Zeno's life is the best refutation of the slander."

"And yet," said the dark-robed councillor, "may not some men think that his former life might warrant some suspicion—that the spendthrift and the gambler might not be above the allurements of money—or that the priest who had forgotten his vows to the church might possibly forget his allegiance to the state?

"There may be those who know so little of our Zeno's real nature as to think thus unworthily of him," said the doge with spirit; "but I will not believe that your excellency is one of them."

The eye of the councillor fell, and the shadow of his brow became darker, as he said coldly,

"I neither accuse nor defend; the province of those who take council for the state is to watch events, and be impartial."

"Your excellency has spoken wisely," replied the doge; "and I am much your debtor for the aid of your counsel. On the one hand, I entirely concur with you both, that the siege should be speedily terminated; but on the other, our general demands his own time to work out his own views. To force him to abandon his own plans, and to act upon ours, is a proceeding that is delicate and difficult—besides involving much responsibility. How do you advise? which of the two courses are we to take?"

"May we not steer our way *between* them?" said he of "the Ten."

"As how, signore?"

"Why thus. Zeno demands time; but he has pledged himself that a very short time will accomplish his object. Well, the state has granted this to him, perhaps already to the full. I would, if it meet your highness's approval, suggest that the further time to be accorded to him be limited to three days. If within that time the besieged unconditionally surrender, well; if not, your highness should direct the troops to assault Chioggia on the following day."

"It is wisely counselled, signore," replied the doge. "We shall forthwith intimate to the general our resolve to this intent."

The three lingered yet awhile along the strand, and then passed onward to the fort, and disappeared.

The decision of the doge was communicated to Zeno without loss of time.

"It is but a scant time," thought he, when the messenger had retired, "three days; and, yet, if my expectations deceive me not, and my plans do not fail, three days will see the standard of Saint Mark once more floating over the walls of Chioggia. At all events, we shall see what those three days will bring forth. Should my object be then unachieved, it will be time enough to decide whether the veteran soldier is to be controlled by the crafty civilian. Meantime, the hours are precious, and much is to be done. It should be near the hour when—" At this moment Alexis entered the room where Zeno was musing.

"Is all ready?" asked the general.

"Yes, signore."

"My cloak, good youth—now let us forth." And so saying, Zeno stepped out into the open air as the last glimmer of twilight had faded into the night.

The general and his attendant proceeded through the camp fortifications, visiting the troops in their respective quarters. This did not excite any surprise, inasmuch as it was the habit of Zeno to take the rounds of the army at various hours of the day and the night, in order to come upon the soldiers unawares. Nevertheless, Alexis did not fail to take special notice of everything as they proceeded. At length, as they reached the quarters of the English archers, the voice of one chanting

pleasantly fell upon the ear, and the massive frame of Hodge o' the Hill was soon discovered stretched on his back at full length by the fire, singing with closed eyes, while some of his comrades were cooking their evening meal.

"How now, goodfellow," said Zeno, touching his foot lightly; "thou art a very nightingale, and takest to singing before it is well dark."

Hodge was on his feet in an instant.

"If it please your excellency, I was but rehearsing for my comrades one of our Island ballads. We Inglishers love to think of our old homes, and carry the memory of the forests with us wherever we stray."

"Aye, and pleasant memories they are, I'll be sworn," said Zeno. "I'll warrant me, too, that the form of some sylvan maiden flits across thy mind to make the memory all the sweeter."

Hodge smiled, and then he sighed, but he made no reply to the insinuation of the general.

"Well, well, where is thy gallant captain? I would fain see him."

"He is not far off, signore—shall I summon him to your presence?"

"No, I would seek him, if you will show the way."

The archer stepped forward, and the general and his attendant followed him. They soon found Sir William Cheke, and, at a signal from the latter, Hodge retired and left them together.

Long and earnestly did Zeno and the English knight hold converse as they paced to and fro in the dark night, while the eyes of Alexis kept keen watch that no one should approach upon their conference unperceived. At length Zeno prepared to depart, and as he did so he took the hand of the knight in his own, and said, "Sir William Cheke, I have now disclosed to you without reserve how I am situated, and what are my plans. On your full and faithful assistance I rely unhesitatingly.

"I will not fail your excellency, on my honour," said the Englishman.

"I know well you will not, if there be faith in knightly honour or truth in English pledge. So, then, to your care I commit the preparations I have mentioned. You have those on whom you can rely to watch the movement. Meantime I shall arrange for the night. You will be with me at the place appointed half an hour before midnight. Till then farewell."

Zeno then left the quarters of the English archers, and with Alexis proceeded on his way, but ere he reached his own apartments he visited yet one other of his tried friends, the Count Polani.

At the appointed hour four men were assembled in the apartment of the general, to which we have so often, in the course of this story, introduced our readers. From their anxious and thoughtful demeanour it was manifest that some critical event was not far distant: they were all in complete armour; two lamps stood lighted upon the long table that ran down the centre of the room, and seats were placed at either side, as if in expectation of other visitors being added to their number.

"Count Polani," said Zeno, "have you instructed this youth? You answer for his faith?"

"Aye, noble Zeno, Giulio is my son; let that be the pledge of his truth."

"A better I wish not to have, my tried, old friend," said the general. "And now, signori, to business, for the time of action is near at hand. Is the camp still all quiet?"

"There were none stirring save the sentinels on watch, as I came hither," said Sir William Cheke.

"Aye," said Zeno, with a bitter smile, "the stillness of the mine ere the train is fired; woe to him that shall put the match to the fuse. Well, it shall be my care to crush with my mailed heel the train and quench it. Better so, than to extinguish it in blood; even that, too, may be requisite."

As he spoke, the fine and manly features of Zeno flushed with the spirit of wild energy that reminded those who looked at him of the strange stories which were told of his reckless youth. In a moment, however, the excitement seemed to pass away; he rose from his seat, and going to a cabinet unlocked it and took out a roll.

"Here," said he, spreading it before his colleagues,—"here is the list of the names of all the captains who command the mercenaries now in the service of the republic. Opposite to each name I have placed my own comments. I know well, from long experience, how far condottieri are to be trusted. Your pardon, Sir William, I speak of the class, and not of those whose honour is above all suspicion—'*Chevaliers sans peur et sans reproche*'—such as thyself. I know how often the soldier of fortune differs but little from the licensed brigand; how readily he will transfer his allegiance; how lightly he holds the obligations of society, esteeming plunder his lawful right. Still, I know well, that though mercenary, they are not mean; though easy in their fidelity, they are not treacherous; and that the most of them are too honourable to join with assassins and cut-throats. I would now avail myself of your experience. Look down this list, and tell me whom we may or may not trust, when a fair appeal is made to their honour."

Polani and the English knight examined the paper carefully, and made such comments as their own knowledge or general reputation enabled them. Giulio was too inexperienced and too short a time in the camp to be competent to form a judgment, and so he modestly abstained from taking any part in the scrutiny. When it was finished, Zeno observed,

"Our estimate agrees to a marvel, signori. Well, then, I shall summon these to attend me in council forthwith. I have purposely abstained from giving a longer notice, lest my plans should be suspected. What ho! Alexis!"

The Greek appeared, and Zeno quickly wrote down the names of those captains whom they had selected, and giving it to the youth, said,

"You will with all speed notify to these that I require their presence here at midnight upon matters of urgency. And take good note of how thou findest each of them employed."

The young Greek went out upon his mission, and the general and his friends occupied themselves during the short time that was still to elapse before midnight in discourse upon the subject which was to be brought before the council.

Now it happened that our old acquaintance, Hodge o' the Hill, just a little before the time that Alexis left Zeno's apartment, slipt quietly forth from amongst his now sleeping comrades, till he came to where some half dozen archers lay, still in their ordinary attire, stretched before the guard-room fire. Silently motioning to these, they arose, took their pikes and swords, and, following Hodge, passed out noiselessly into the open air. In a few moments they had reached the quarters of the Italian lancers under Recanati, and concealed themselves beneath the projecting angle of one of the bastions. It was manifest that Recanati's band had not retired to rest; here and there dim lights twinkled forth into the gloom of night and again disappeared, as if quickly shaded from observation; the ring of mail and the clank of weapons were occasionally heard in the silence; and words were whispered and answers given as if the whole force was mustering. In a short time all these sounds ceased, and then the door was opened, through which, by the faint light from within, the watchers perceived two men pass stealthily out. They paused for a moment as if endeavouring to look through the gloom, and to catch any sound that might indicate the vicinity of other persons. Apparently they were satisfied, for one muttered to the other,

"Tutto va bene."

And then they proceeded rapidly to traverse the camp.

"Now," said Hodge, when he had suffered them to proceed till they were almost lost in the gloom; "now, comrades, we must follow the trail; be silent as the grave, and sure as death."

Preserving their distance, they dogged them almost breathlessly, till the lancers reached the quarters of the German mercenaries. Then Hodge and his party made a swift detour so as to meet the others face to face, as if apparently coming from the place to which the others were going.

"Buona notte, compari," said one of the two lancers; "whence are ye?"

"From Von Richter's band. Siamo Tedeschi."

"Good; lead us to him instantly; we have good news and stirring, brothers."

Hodge and his companions led them somewhat from the direction, and surrounding them without being suspected, they suddenly seized the two men, and muffling their heads, prevented a sound from escaping their lips. They next handcuffed each, and enjoining them to offer no resistance, led them quickly to the quarters of Sir William Cheke.

"So far all is well," said Hodge, as he led the two men into a small room. Then, removing the covering from their heads, "Good fellows, if you will promise to make no disturbance, I am even content to leave you to breathe freely; but if you are noisy, I shall be forced to gag you both. My orders are peremptory on this point. How say you?"

The lancers, finding they were in the power of the archers, gave a sullen assent to the terms proposed.

"Good," said Hodge; "I must now leave you, my masters. When you are wanted, I shall call for you."

So saying, he withdrew, bolting the strong door after him.

"Morris," he continued, addressing one of his companions, "thou wilt keep ward upon these fellows. I have good warrant for what I do, and shall justify it to our captain. Let the others follow me."

Hodge now proceeded amongst the rest of the band, whom he unceremoniously aroused from their slumbers.

"Up! my lads, up! It is the desire of our good captain that you arm in all haste, and hold yourselves in readiness in case he sends for you."

"How now, Hodge," cried one of his comrades grumblingly, as he rose up, and stretched out his arms with a yawn, "God 'a mercy, man, what's in the wind?"

"Marry, Robin," said the other laughing, "thou shalt find when thou art out of thy kennel and puttest thy nose to the ground; 'tis just the night for the scent to lie. But be nimble, sweet hearts, be nimble, and lie close till the time comes to start the game."

By this time the English archers were all up and busily accoutering themselves, which when Hodge saw, he turned to one of those who had been with him upon his recent errand, and said:

"Come, Hubert, thou shalt away with me; and so, comrades, farewell. Let one keep watch without, with his ears wide open. When he hears the forester's whistle, then let him who is next in command lead down our merry men all towards the general's quarters."

Ere the last words were well past his lips, Hodge o' the Hill and Hubert Leslie were rapidly treading their way towards the council chamber.

The hour of midnight was now come. In the chamber of the Venetian general were assembled those captains of the several companies of mercenaries whom he had caused to be summoned. One might readily discover, from the general surprise and anxiety that appeared on the countenances and in the demeanour of these, that they awaited the disclosure of some important intelligence, the nature of which they in vain endeavoured to speculate upon. Some had come in haste, and totally or partially without their armour, as if aroused from sleep; others appeared completely clothed in mail. After a moment's thoughtful silence, Zeno arose. Never did he appear more noble, more composed, more self-reliant, than at this moment; and as his eye passed in slow review over the countenances of those now around him, as if its gaze could penetrate into their secret souls and read their hidden thoughts, all felt that his was indeed the master-spirit of the whole camp. Then he spoke amidst profound silence.

If there be any faith to be placed in what the chronicler of his life has reported to us of this occasion—and we are inclined to think it most faithworthy, first, because that chronicler was Jacopo Zeno, the nephew of the great captain, and ought to have known the whole truth; and, secondly, because he was a right reverend bishop, and ought therefore to have spoken nought save the truth—if, as we say, there be any faith to be placed in the account that has come down to us of this memorable night, the speech of Zeno was one of singular address and power. By turns he touched on every topic that could arouse the fidelity, pique the honour, and excite the sympathies of knights and soldiers, and stimulated the minds of his auditory with the picture he drew of those perfidious conspirators who were plotting the ruin of them and the republic, ere he detailed to them what were the plots, or disclosed who were the plotters.

"Brothers," said he "I see that you are all in a state of anxious suspense, and would fain know why I have called you together thus suddenly in the dead of night. But I have done so because I well know your fidelity and love to me as your generalissimo, as you know mine for you as true and brave chieftains. Of these mutual sentiments we have each given proofs in abundance during this protracted war." Then he proceeded to adduce various instances in proof of what he stated; and as he recounted many a deed of daring, many a victorious encounter, many a peril and many a privation in which they had been engaged together, one might see the effect upon those who listened as the memory of these things came back upon their hearts, and made them warm with pride and affection towards their illustrious comrade—the great captain of his age, the great leader under whom they had fought and triumphed.

"But no more of this," he continued; "if you have suffered straits at times, so have I, and well you know, my friends, that I spared not my own patrimony to share it with you, brother soldiers."

A general murmur of assent attested the cordial acknowledgments of his auditory.

"Aye, brothers, I may well rejoice to be surrounded by hearts so brave and worthy; but I am grieved to think that there are amongst us, those," and his brow grew dark as he spoke, "who are as rash and dishonourable as they are ungrateful; not against me alone, who have ever sought to win them from their schemes and engage their love, nor yet alone against the republic to which they owe allegiance and respect, have they plotted, but even against you their companions in arms. Ah! you look in wonder; but it is so. This very moment, even while I am speaking, we are all in deadly peril—our safety, our lives are in jeopardy. Know you that this night would have been our last, had not heaven itself befriended us. And, as it is, I see that all which your valour and your toil has achieved will in an instant be rendered abortive, unless indeed your wonted fidelity and truth and honour ward off the calamity that is now impending. Aye, there are those in our army who have entered into a foul conspiracy against us all. We are betrayed by some of our own who have sold us like merchandise to the enemy, and a price has been put upon our heads, and they who should be the first to protect us are the first to hand us over to the Genoese to be butchered in the darkness of the night."

Zeno paused, for his emotion well-nigh mastered him. Astonishment, horror, and curiosity were visible on every brow. None, however, spoke, but awaited the further disclosures.

"You will ask, brothers," he resumed, "why I have waited thus till the last moment. Well, it is because until this very day I have not been able to procure evidence sufficiently complete and convincing to lay before you; but now I shall submit the proofs to your own eyes, you shall touch them with your hands," and he laid his own on a portfolio of papers that lay before him on the table. "But first I demand a pledge from you; I claim from you as well the aid of your arms as the advice of your judgments. Promise me that, when I shall expose the treason and exhibit the traitors, you will be true to me, to the republic, to yourselves. Promise me that the traitors shall be left to suffer the punishment which they deserve—let them pay the penalty of their crimes. So, while they shall afford an example to posterity of perfidy and baseness, you shall now consecrate your names to future ages as valiant soldiers and faithful allies."

MEDITERRANEAN STEAMBOATS.

The events which are occurring in the east of Europe are calculated to bring into increased notice the efforts made to provide the Mediterranean with efficient steam navigation. Hitherto, these efforts have not been crowned with as much success as we could wish. To say nothing of the very defective character of the boats and crews in the pay of the Turkish government, even the French and English steamers have been found wanting in many of those requisites which encourage travelling. Sufficient care has not always been taken to make them fit for competing with the splendid vessels which carry on the American trade. Much has been done, and is still doing, in the way of improvement.

One of the best steamers that ever entered the Mediterranean was the "Vassitei Tidjaret," built for the Sultan, or rather for his mother, the Sultan Validé, by Messrs. White of Cowes, and fitted up at Blackwall under the active superintendence of Mr. Edward Zohrab, the Turkish consul.

It was a graceful, beautiful vessel, with admirable engines by Messrs. Maudslay. Many persons regretted that she was not kept in this country by the government for a royal yacht. She was a very different affair from the old "Hilton Jolliffe," the first steamer ever seen by the Turks, who, along the coast as she steamed up, were as alarmed as the Hindoos on the Ganges. She was purchased by the Sultan, and for many years was the only steamer in the Ottoman Empire.

On the first voyage of the "Vassitei Tidjaret," she took in recruits at Smyrna for Constantinople. It was the first taint the beautiful vessel had. It took all hands and a dozen Maltese, with brooms, buckets, and holy-stone, and tons of water, to get rid of the dirt and vermin they left. The cleaning was, however, of little use, for she was soon in about the same state as an Irish swine-boat, or a Newcastle collier, says an English traveller, who was on board of her for some time.*

An Armenian proposed, directly he saw her, to make her a transport ship for horse-beans, as a yacht was useless to the Sultan, who could not leave "his womens."

The vessel was unlucky the first time she went out, knocked her flag-staff against the bowsprit of a frigate, or something of that sort, and her fate was sealed. No Turk would go aboard of her again. There was a *kismet* against her.

Several of the steamers employed by England, France, and the Austrian Lloyds are splendid boats, and there is some talk of putting some such vessels on the line as the "Argo," belonging to the General Screw Steam Navigation Company, a vessel which went round the world, 27,900 miles, in 112 days, and rode out a fearful storm without some of the passengers being disturbed from their peaceful slumbers.

MEDITERRANEAN STEAMBOATS.

The time is soon coming when vessels will run, without stopping, a distance of 6,000 miles at a speed of 20 miles per hour. Already, the West India Company's steamer "La Plata" has run 4,000 miles at 12 miles an hour, in a most tempestuous ocean.

We shall soon consider a journey to Constantinople, *via* Marseilles, as a mere trifling trip. Our commerce with that part of the world is already very important, and with settled peace will be still more so. It is with gratification, therefore, that we observe any addition to already existing steam facilities.

The vessels designed above are a recent addition to the service.

* Macfarlane: "Turkey and its Destiny," 1848.

A FEW WORDS FROM AUSTRALIA.

BY WILLIAM HOWITT.

McIvor Diggings, Victoria, July 1, 1853.

On my arrival in Australia, I found the ignorance of the British public extreme as to the actual state of affairs there. Consequently the whole body of passengers in the Kent, in which I came out, were in great consternation at the discovery which they made. The astounding price of everything; the astounding charges for conveying luggage from the ship to the town wharf, and again from the wharf to any quarter of the city, amounting to more than the freight all the way from London thither, 16,000 miles. The next to impossibility of procuring the meanest lodgings, at rates for which you might almost take a house in Belgrave-square; the charge of five shillings a week for permission to pitch a tent on the waste lands near the town; and the discount, at that time, of 20 per cent. taken on Bank of England notes. I immediately wrote to a leading morning paper stating this fact, and the letter had, as I learn, great effect. I have seen many gentlemen here who thanked me for so opportunely putting them on their guard, inducing them to bring out more money with them, and that in gold, by which they had avoided much difficulty and loss.

But there still needs a warning voice, and that a loud one, addressed to the thousands and tens of thousands who are still thronging towards this colony, in the certain belief of making a speedy fortune at the diggings. It appears from the newspapers, that the gold mania is still on the increase—has not yet even reached its height, and that it is only the limited number of ships procurable for the voyage which prevents a still greater number of enthusiastic adventurers from rushing to the shores of this Austral El Dorado. I do not suppose that any warning, any sober statement of real fact, will check this mania till it has run its course. Like the railway mania, it will drive on its victims till there has been such an amount of misery and disappointment, as shall drown and overpower even the clamorous voices of interested parties, and the thirst for the sudden acquisition of wealth. As I have come out here, however, partly to make myself personally acquainted with the whole gold and gold-digging question, and, having done that, to make the public acquainted with it, I should not feel that I was fulfilling my mission towards my fellow-countrymen if, even at this stage of my progress, I did not endeavour at least to set them right as to the prospects which this colony really holds out to emigrants.

I will begin, therefore, at once by stating that those florid and extravagant accounts which have been sent out from Victoria to all quarters of the world, of fortunes to be made, and that in a very brief time, by gold-digging, are empty, base, and fallacious. In Lord Denman's phrase, they are "a delusion, a mockery, and a snare." They are more—they are a gross delusion, a cruel mockery, a most fatal and inevitable snare!

I do not mean to say that there is not gold, and a great deal of gold, in Victoria. The quantities announced from time to time as having arrived in London, the ten tons at once landed from the Australian, and the large nuggets from Balaarat, are sufficient evidence of that. But what I mean to say is, that this gold is not found in such quantites, or with such ease, as was represented by the enraptured Victorians, and in the despatches of the governor before I left England—statements which, taken literally, would induce any one to believe that he had nothing to do but to come over to Mount Alexander or Bendigo, shovel up a heap of gold in a week or two, and return home. Such accounts, I presume, must still be circulated in England, or the mania of emigration could not run so astonishingly high as it appears to do. When I was down in Melbourne a few weeks ago, no less than six thousand persons arrived in one week in that port alone from England. The environs of the town were covered with tents, as with the camp of a hostile army; those being the only places in which the newly-arrived could find shelter. The town was crowded, nay, rather glutted with people. Single rooms were letting for £6 per week, and the price of everything was as fabulously high as ever. Bread, 3s. a quartern loaf; butter, 4s. a pound; flour, £3 10s. a bag; hay, £60 a ton; oats, £1 a bushel; boots, £4 a pair; firewood, £3 a cart-load; bricks for building, which, in 1843, were 8s. a thousand, £12 10s. a thousand; and so on. The inhabitants are at their wits' end to know where all the people thus arriving, at the rate of a thousand a day, were to be lodged, and the newspapers gave the most harrowing accounts of the miseries which these new *arrivés* were suffering, from being turned out on the wharves at evening amidst the darkness and the drenching rains of winter, and not knowing where to find a shelter for their heads. I refer you to those accounts in the papers themselves.

Now all these people come out flushed with the hope of certain and speedy fortune at the diggings, and are, of course, wofully disappointed. I have seen scores returning almost immediately to England, denouncing in no measured terms the imposition which had been practised upon them. I have seen and conversed with hundreds, and I rarely found the man who was not complaining of having been grievously deceived by the accounts sent to England of the country, of the climate, and of the enormously remunerative nature of the gold fields. In fact, there has been a great deal of what is vulgarly called *gammon* played off by interested parties, to draw a population to this colony. The climate has been represented as perfection, as something quite etherial; the land of "unrivalled fertility"—that is the favourite phrase—and the means of personal aggrandisement as boundless.

All this has been a false and foolish policy, because the country, the climate, and the capacity of the colony for enriching its inhabitants, properly and fairly stated, are sufficiently good to draw a large body of emigrants, and to make them prosperous. The evil is not in the country, but in the false colours in which unprincipled speculators and land-jobbers have arrayed it. The mischief has been, and is, not in people coming to this country, but in coming to it under the influence of exaggerated and false representations, and thence imbibing a disgust for what, under other circumstances, would have pleased and remunerated them. The climate certainly is not perfection, but taken in the whole circle of the year, is a very fine climate. The land is not all of unrivalled fertility—there are millions and millions of acres of perhaps as sorry land as the world can show—but still there is plenty of fine land, and that lying near the coast, while the rest is well adapted for huge herds of cattle and flocks of sheep to roam over at large, and to supply the colony with meat, and England with wool. What is wanted to prevent disappointment, and to insure satisfaction, comfort, and prosperity in the great body of emigrants, is simply that they should know really the truth of things—the truth divested of all false colouring, whether that of interested speculation, of *coleur-de-rose* enthusiasm, or of disgust generated by imposition. There are thousands who have come hither and failed, and who have gone back cursing the country and those whose florid descriptions had brought them to it, who, had they come with correct views of what they really might expect, would have had no cause to regret their visit to Victoria. I shall, therefore, in a few remarks on gold-digging, on the climate, and on the real prospects of advantage which the colony holds out to emigrants, endeavour to prevent, as far as in me lies, future false expectations and consecutive disappointment.

I repeat it, then, that gold-digging is not the road to fortune in this country. I have seen plenty of people who have enriched themselves, and some in a comparatively short time, in trade; in occupying squatting stations, that is, being sheep and cattle farmers; and in speculations in land, chiefly in town allotments; but I have never yet met with that man who has made a fortune by gold-digging. It is true, I have heard marvellous stories of such men, and still more marvellous ones of wonders doing on the diggings, but in every instance when I have searched these miracles to the bottom—and I have made it my business on all occasions to do so—they have resolved themselves into MOONSHINE. Such stories are often very wonderful on the diggings themselves; no wonder then that they are very marvellous by the time they reach Mel-

bourne, and most irresistibly splendid by the time they reach England. I have now been more than nine months in the colony, have travelled at least 700 miles to different diggings, furnished with letters from the governor himself, and others of the most influential men in the country, to the gold commissioners in the gold fields; living in intimacy with those gentlemen, and also going familiarly amongst the working diggers, so that I have had every means of testing the truth or falsehood of these marvellous stories; and the result has been that everything marvellous has vanished, and a stern reality has remained behind.

Let us take as a sample of the fortunes of gold-diggers, or rather of gentlemen coming hither to assume that character, the cabin passengers of the ship in which I sailed. These amounted to about twenty-four, and of these something more than half tried their fortunes at digging, or on the diggings. The rest, intimidated by the accounts which they heard in Melbourne of the hardships and the little profit attending digging, settled down in Melbourne, in situations or in business for themselves. All of these, or nearly all, have done well. One of the most confident men whom I have heard of as coming out, avowedly to try his fortune as a digger, was in this same ship. During the voyage he was amongst the most sanguine regarding the fortunes to be made of the whole company, and full of schemes for going a-head up the country, far beyond the ordinary diggings, and there finding hitherto unexplored treasures, and coming down again loaded with them. The information which he received in Melbourne at once cooled his enthusiasm, and he never ventured to the diggings except on an experimental trip or two in the private escort. Since then, he has been hanging about in Melbourne importuning the government for a post, and just now, that is, after nine months' waste of time, has been sent up to the diggings as an assistant gold commissioner—a sort of respectable banishment, but by no means a profitable one. The rest of those who at once cut all idea of the diggings have done well in trade.

And what have the digging moiety done? With the exception of ourselves, only two of them have done anything at all. One of these two made a short campaign at Balaarat pretty successfully, but was soon convinced that he could do much better with far less labour, and having good banking connexions in the colony, settled down as a gold-broker, and is making a large income. The other individual was the doctor of the ship, who succeeded at the diggings, not by digging, but by practising. The rest speedily abandoned the diggings in disgust, and some of them made the best of their way home. One gentleman, who was all enthusiasm on the voyage, and declared that he would go up to the diggings and would not come down again for two years, we met on his way back before we reached the gold-fields, most indignant at what he called the hoax that had been played off upon him, at the diggings, and by the climate. He had found the only men almost who could procure any gold, working under a blazing sun up to the middle in cold water—intensely cold water running from the mountains: they were, at once, streaming with perspiration and chilled in their lower extremities as with the chill of death. They were obliged to work day and night by turns, in parties of from fourteen to twenty, to keep the water down, while the black ooze at the bottom of their holes stunk as vilely as any sewer. He himself had suffered severely in his health, and was nearly blind with the opthalmia, occasioned by the intolerable swarms of flies, which are the curse of the country during the summer months. This gentleman lost no time in shipping himself back to England, where he would arrive at last £500 the worse for his expedition.

Others of our fellow-passengers were not far behind him on their way back, quite satisfied with the taste they had had of the gold-fields. Two others were not so fortunate; they died on the field, one of them a medical gentleman of very extensive knowledge, who had built so much on the golden fables which had drawn him out, that on seeing with his own eyes the miserable reality, his spirits gave way, and he died in a very short time from sheer dejection of spirits. One of my first visits at the Ovens diggings was to his grave in the bush. Such have been the fortunes of the cabin passengers of one ship. Of the intermediates I know little; but I have heard of none that have had much success; but of one, a healthy young man, who died from the bite of a centipede at the gold-fields, and of a widow lady, whose three children were all swept away by the country fever in a very few weeks.

Such, I say, have been the fortunes of the passengers of that one ship—such, I doubt not, would be pretty much that of most ships which arrive here. In fact, numbers on coming into port, and learning the real state of things, have never quitted their ships at all, but taken their passage back in the same vessels. But what is the fact? If these gentlemen of whom I have been speaking had come out truly informed as to the country and its capabilities, they might every one of them have done well. Instead of being the victims of the gold-digging delusion, they would have engaged in the trade of the place, and might have made fortunes. But they were possessed by a delusion, most culpably fostered by interested parties; and in their disgust they turned away from the colony, altogether incapable of seeing the truly golden opportunities at their feet in the shape of trade, or in trafficking in town allotments.

The sooner, therefore, that the gold-digging delusion is got rid of the better, and that certainly would not continue long if the people in England really knew what going to the diggings meant. It seems a very easy thing in England, with railroads and good macadamised highways, to go some eighty or a hundred miles, and just dig a few holes of four or five feet deep, as is generally represented, and pick up heaps of gold and great dazzling nuggets. But I will tell you a little of what it is to get up to the diggings in a country which has neither roads nor bridges, but plenty of bogs and rugged mountains to cross, and deep gullies and streams to get through. We ourselves have now been nine months in the colony, and it has taken up *five* months of that time in travelling, or rather *straggling*, to the diggings. We have had a cart with a couple of good horses to carry our tent and effects; we have had letters to the principal settlers on the different roads, and every possible advantage; yet, spite of all this, and of the determination to flinch from nothing, till we had accomplished our object, such has been the rate of our progress. Last summer we went to the Ovens diggings, which were represented to be 150 miles off. We found them 220. We found the roads, or rather tracks—for roads, as I have said, there are none—so frightful from deep bogs, steep and rocky hills, deep ravines, and unbridged streams and rivers, that after the most arduous exertions—loading and unloading, digging our cart out of bogs and dragging it by slow degrees over hills, seeing bullock drays smashed ever and anon in the road, and horses and bullocks lying dead, killed in the vain endeavour to get along—our own vehicle broke down midway, and we were, as it were, pinned to the ground, with no means of getting away, in a burning desert where the sun was, from day to day, at 120° in our tent, and compelled to drink stagnant water, till we were all, more or less, attacked with dysentery. For myself I was very near giving up the ghost there; and I doubt whether any of us would have got away alive, had we not found the house of a hospitable settler not far off, who at once came and removed us thither. We reached the diggings *in two months*, and found that there was nothing to be done there, so we made our way right a-head up the untracked bush towards the Snowy Mountains, where we dug for two months with as much success as most find. But we were soon tracked and followed—followed by thousands, for such is the vast number of people now in the diggings—I suppose not less than 200,000—that competition is as hot and severe as it is in any city in Europe. At every rumour of anything being found on any particular spot, there is a *rush*, as it is called, of hundreds and thousands; the ground for many acres' extent is literally torn to pieces under the feet and spades of the throng, and it is utterly impossible that any one man can appropriate to himself any great quantity of gold.

GROUPS IN MARBLE.

The two groups which we here present to our readers, cannot certainly merit consideration on account of the novelty of their subject. There are scores of stories, old and new, about the fidelity of the dog, and what brave deeds dogs have done to save a master's child from harm. With mallet and chisel M. Lechesne has told such a story. Here the sportive child, with his huge, shaggy companion, half guardian, half playfellow, is attacked by a serpent. The scaly monster is ready for the fearful dart, and the boy's peril is imminent—the dog, with a look of mingled rage and terror, regards the reptile as if uncertain what to do. But the next group tells the end of it. There the serpent lies dead; the dog has not only "scotched" but killed him outright; and the child hangs upon the neck of his good friend, whose kind, gentle, loving look affords a fine contrast to his former expression. The story is simply and clearly told, and both designs are worthy of high praise.

ATTACK AND ALARM.

As to the novelty of subject, painters and sculptors rarely invent. The creation of people and scenes is not their principal object. Commonly they are content to draw the subjects of their compositions from history, sacred or profane, legendary lore, or the imagination of the poet. They do not seek in this way to be original, but rather to present such scenes and such figures as may occasion the spectator at the first glance to say, "I know that subject;" it is their effort to seize upon what has already engaged the public mind, and to present it with new and unimagined beauties.

Everybody has heard of the fidelity of the dog. Deeply affecting is the story of Gelert. We remember how the Welsh prince followed the chase, and as the sun went down came home to his castle; how his heart was glad as he thought of his child, a bud of promise; but how he trembled and grew pale as Gelert, the hound, his boy's companion, bounded forth, while his lips and fangs ran blood; how Llewelyn sought his child, a fear at his heart that he dared not express, but sought in vain, and at last, in frantic rage, supposing the dog had devoured his little one, drew his sword and slew the creature as it fawned upon him; how the dying yell of the dog was echoed by an infant's cry, and concealed beneath a mangled heap he found his rosy boy unhurt, while underneath the couch a great wolf lay all torn and dead.

"Ah! what was then Llewelyn's pain!
For now the truth was clear.
The gallant hound the wolf had slain,
To save Llewelyn's heir."

Something like this story, without its tragical ending, is that which these groups present. The devoted attachment of the dog to its owner is as true as it is interesting. His constant love is never chilled even by neglect; he cannot be estranged by ingratitude or harshness; he devotes his whole attention to his master, obeys his commands with docility and cheerfulness, tracks his steps, and watches his looks. Few companions are more pleasant than a canine favourite, and few indeed are the friends that are to be found more true and loyal. Who need be ashamed of speaking in the praise of the dog? Did not Alexander the Great erect a city in memory of one of these favourites? and Solon did not think it beneath him to record the fidelity of that dog who leapt upon the funeral pile of his master, and perished in the flames.

M. Lechesne has sculptured a high eulogium on the dog. The three actors in his drama he has designed with the utmost care, and finished with exquisite delicacy. In beautiful harmony are the positions of the child, the dog, and the serpent.

Our readers doubtless remember the plaster casts of these two subjects which were exhibited during 1851 in the Crystal Palace, and for which a prize medal was awarded to the artist. At that time they attracted a great deal of attention, and people began to inquire about their sculptor, a young French artist just rising into fame.

Both groups are admirably adapted for the entrance of a park, a garden, or noble mansion. They are the fitting emblems of faithful guardianship. But in the present state of public taste it does not follow that a work of art should occupy the position which is most appropriate for it. Sculptors and painters both feel this alike. We do not yet thoroughly nderstand the utility of beauty. Sculpture and painting are regarded rather as ornamental than essential. Yet the cultivation of taste, the encouragement of all that can possibly contribute to that desirable end, is one of the most importan works of the age. We have great, deep, serious lessons yet to learn in this particular, especially here in England; we are in danger of forgetting that philosophy which teaches us that the beautiful is the priest of the benevolent. When our Great Exhibition was open, it was said that in sculpture—that formative art in which England has, on the whole, least of all distinguished herself, in which she is even less independent and less technically proficient than the rest of modern Europe—the stand we took was low indeed. In this there was much truth: French and German works threw us into the shade. Why was this?—how did it occur?—how long is the same thing to last?

VICTORY AND GRATITUDE.

PEERS AND M.P.'S;
OR,
LORDS AND COMMONS.

THE COMMONS—THE SPEAKER.

The office of Speaker has gradually come to be what it is. At first his powers and privileges were but vaguely defined. With the Revolution his importance commenced. Since that time, he has occupied his proper station at the head of English gentlemen. He now takes his place next to peers of Great Britain, both in and out of parliament. As a privy councillor, he has precedence at the council table. Though on common occasions he gives place to Irish peers, and those who by courtesy take rank before some peers of the realm, as sons of dukes and marquises; yet in all commissions by act of parliament he is named before them, and so ought to be on all solemn and national occasions. To secure his perfect independence, he ceased, in George the III.'s reign, to hold any office of profit under the crown. His salary is £6,000 a year, exclusive of a furnished residence. At the end of his official labours, he is generally rewarded by a peerage, and a pension of £4,000 for two lives. Dodd describes his duties as follows:—To read to the sovereign petitions or addresses from the commons, and to deliver in the royal presence, whether at the Palace or in the House of Lords, such speeches as are usually made on behalf of the commons; to manage, in the name of the house, where counsel, prisoners, or witnesses are at the bar; to reprimand persons who have incurred the displeasure of the house; to issue warrants of committal or release for breaches of privilege; to communicate in writing with any parties when s

instructed by the house; to exercise vigilance in reference to private bills, especially with a view to protect property in general, or the rights of individuals, from undue encroachment or injury; to express the thanks or approbation of the commons to distinguished personages; to control and regulate the subordinate officers of the house; to entertain the members at dinner, in due succession and at stated periods; to adjourn the house at four o'clock if forty members be not present; to appoint tellers on divisions. The Speaker must refrain from debating, unless in committee of the whole house. As chairman of the house, his duties are the same as those of any other president of a deliberative assembly. When Parliament is about to be prorogued, it is customary for the Speaker to address to the Sovereign, in the House of Lords, a speech recapitulating the proceedings of the session. It is hardly necessary to add, that during the time the Speaker is in the chair, he wears a gown and wig, and that the mace lies upon the table, but is immediately removed if the Speaker leaves the chair and the house goes into committee. When the Noes and Ayes are equal, we must also remember that the Speaker has the casting vote. We imagine few men are more glad to find the session over than the Speaker. It is true, at the latter end of a session the house is generally in committee, but still the Speaker is required to be on the spot, to resume ordinary business when the committee is over. Still, however, the amount of work does not generally do him much harm, as it is only this last session that it seems to have ever entered the imaginations of members of Parliament that the Speaker could be ill, and on that account unable to discharge his official duties. Generally the Speakers have been remarkable for good health. However, Sir H. Inglis evidently believes that a Speaker may be laid up as an ordinary man is, and thinks it but right and proper that for such a contingency the house should be prepared. It is rather singular that it should be left till now to settle such a point. There are instances in which extraordinary care has been taken of the Speaker's health. Sir Fletcher Norton having given great offence to ministers by his conduct in the session of 1780, Lord Germaine, pathetically lamenting the precarious state of Sir Fletcher's health, moved that Mr. Cornwall be chosen Speaker instead. Sir Fletcher assured the house that his health was quite recovered; his friends did the same. All was in vain, and the nominee of the ministers was appointed in his stead. But such cases are very rare, and now the house has wisely resolved, that in case of the Speaker's absence through illness, the chair should be taken by the chairman of the Committee of Ways and Means. As it may interest our readers to learn the form observed when the Speaker elect is introduced to Majesty upon the occasion of his election, we add it here. When the Speaker has been chosen, he appears before Majesty with the following address:—

MOST GRACIOUS SOVEREIGN,

The knights, citizens, and burgesses of your House of Commons, in obedience to your royal commands, have proceeded to the choice of a speaker. They have among them many worthy persons eminently qualified for so great a trust, yet, with too favourable an eye, have cast upon me, who am really conscious to myself of many infirmities rendering me much unfit for so great an employment. And although my endeavours of excusing myself before them have not been successful, yet they have been so indulgent as to permit me to continue my endeavours therein before your Majesty's most piercing and discerning judgment.

The veneration due to Majesty, which lodgeth in every loyal breast, makes it not an easy matter to speak before your Majesty at any time or in any capacity. But to speak before your Majesty in your exaltation, thus gloriously supported and attended, and that as Speaker of your House of Commons, requires greater abilities than I can pretend to own.

I am not also without fear that the public affairs, wherein your Majesty and your kingdom, at this juncture of time, are so highly concerned, may receive detriment through my weakness.

I, therefore, with a plain humble heart, prostrate at your royal feet, beseech that you will command them to recall what they have done, and to proceed to another election.

The Lord Chancellor, by direction of his or her Majesty, having assured the Speaker elect that "he is in every way qualified and fitted for the appointment," the latter personage then prays on behalf of the Commons:

1. That, for our better attendance on the public service, we and our servants may be free in our persons and estates from arrests and other disturbances.

2. That in our debates liberty and freedom of speech be allowed to us.

3. That, as occasions shall require, your Majesty, upon our humble suit, and at such times as your Majesty shall judge seasonable, will vouchsafe us access to your royal person.

4. That all our proceedings may receive a favourable construction.

To this second address, of course Majesty replies in an equally agreeable manner, and so the matter ends. This form has been in use since the time of Charles II.

PARLIAMENTARY PRIVILEGES.

Some sturdy Radical, as he reads the title of this chapter, may perhaps utter an exclamation of an unpleasant nature. My good sir, you are decidedly wrong in doing this. A member of parliament in the discharge of his duties must be protected, and that implies, he must possess privileges of some kind more or less. Again, it may be urged that, independently of that, he deserves them; for no man has to work harder than a conscientious M.P.

The privileges of the house are extensive, but at the same time they are indefinite and uncertain. Some have become obsolete; for instance, payment of members. From inquiries made by Sir Francis Palgrave, it appears that the sums demanded by knights of the shire were not always uniform. Sometimes one knight received 3s., and his colleague but 20d. The writ de expensis for Thomas de Luda and Johannes de Sonninghall, in February, 1324, includes a charge of fourteen marks for twenty-four days' attendance at the parliament, and two days coming and two days returning, at the rate of 3s. 4d. each per diem. There is a record of the sheriff of Somersetshire being attached to answer for having assessed the wages of one of the knights of the shire at 16d. a day only. The borough members do not appear to have been so well paid. The corporations were economical, and drove hard bargains. A curious agreement, made between John Strange, member for Dunwich, and his constituents, in 1463, is preserved, by which it appears that the honourable member consented to take for his wages no more "than a cade full of herrings and a half barrel of herrings, to be delivered on Christmas next coming." Surely with such a slender allowance the most economical borough reformer could not find any fault. In later times the members were better paid. The remnant of the Long Parliament raised the sum paid to members to £4 a week. The last man who took the benefit of this provision was Andrew Marvel, who surely earned his wages, if ever popular representative did. At the present time, members of parliament enjoy, as one of their privileges, freedom from legal arrest and seizures, under process from the courts of law and equity. This, however, does not extend to indictable offences or to actual contempts of the courts of justice, or to proceedings in bankruptcy. As formerly exerted, this privilege was a flagrant abuse. The protection enjoyed by the members was extended to their servants. It was also made a matter of barter, and exercised by needy friends and retainers. The Lords and Commons gave these protections *ad libitum*. When pressed for a loan in 1641, the Londoners replied, "That by reason of the privileges of the members of both houses, and the protections granted, especially by the Lords, a vast sum of money is detained from them; so that trade cannot be driven nor are they so able to lend money for the service of the commonwealth as they desired." When, in 1677, the Speaker issued his mandate to supersede and call in all paper protections, the messengers found no less than 800 in London and Middlesex alone! In one case, a member protected a gentleman as a menial servant, who was found to have an estate of £2,000 a year, a sum equivalent to three times that amount at the present time. To destroy this licence took some time: it was not till the time of George III. that the abuse was full rooted out.

Freedom of speech is another privilege—a privilege without which Parliament were a mockery, a delusion, and a snare. It was in Henry VIII.'s time that it was first named in the Speaker's petition to the throne. In the time of glorious Queen Bess this privilege was fought for with some difficulty, but often the house was too quiescent when this essential right was attacked. It is to the Eliots, and Wentworths, and Pyms, and Hampdens, we owe it that this privilege was not crushed almost at its birth. It was they who won free speech from despotic courts; and for this their names should be held in lasting honour. A time, however, soon came when freedom of speech was in danger from its friends. During the Long Parliament this privilege was attacked by men of all parties, and of opinions however extreme. An overbearing majority scandalously refused to tolerate any difference of opinion from their own. Fortunately, the Restoration placed upon the throne a spendthrift and a libertine, whose necessities compelled him to beg of the house, and to whom, therefore, the house felt its superiority, and again plain speaking was heard where it had been long banished. When the Revolution took place—when the bigot James threw away his kingdom for a mass—when the divine right of kings to govern wrong was torn to tatters and trampled under foot—freedom of speech grew and became strong. The haughty country gentlemen of England, however they might venerate an hereditary, had no reverence for a parliamentary king, and buffeted and abused at their own sweet will the hero to whom England owed her preservation from Rome and France. In the fierce party warfare which then began, and raged during the reign of Anne and her successor, whilst Speaker after Speaker was censured or sent to the Tower, the deed was done by the house itself, and it is clear that the act was aimed in general more at the speaker than the speech itself. A Tory majority sent Walpole to the Tower; Shippen was sent thither by the Whigs. In our times this paltry revenge is abandoned, and freedom of speech is the universal rule. The house is too wise now to make a man an offender for a word; though occasionally a member who feels himself aggrieved may move that the obnoxious words be taken down. Occasionally members offending ingeniously got out of a scrape. No man, perhaps, did this better than Sir W. Whitelocke, the member for the University of Oxford. Opposing some clause in the Bill of Settlement, he remarked, "Should the elector of Hanover succeed to the throne, which I hope he never will—" The conclusion of his sentence was drowned in shouts of, "To the bar! to the bar!" But he recovered his presence of mind in the clamour, and refused to apologise. "The queen," he added, "is younger than years than the elector, and I merely expressed a loyal hope that she might survive him." Of course, after such a loyal explanation, censure was disarmed.

The remaining privileges of the house may be briefly described. They have become shorn and diminished in these reforming days. Members no longer frank letters, as they did at one time, to an alarming extent; but they are exempt from serving the office of sheriff, from obeying subpœnas, and serving on juries. Every member can introduce one person to the strangers' gallery. Amongst the privileges of both houses are the power of committing individuals to prison; the power of publishing matters which, if not issuing from such high authority, might become the subject of proceedings in a court of law; the power of directing the Attorney-General to prosecute persons accused of offences against the law, or affecting the privilege of Parliament; and finally, a power resides in each house respectively of doing anything—not directly contravening an Act of Parliament—which may be necessary for the vindication or protection of itself in the exercise of its own constitutional functions. Such are the privileges enjoyed by our illustrious senate; privileges no more than right and proper, since that senate represents the people, the only source of political power.

PARLIAMENTARY FORMS.

Of these decidedly the most important is that which attends the opening of Parliament. This generally takes place in February, and if you have the good fortune to have the *entrée* to the House of Lords on that day, you had better take your seat by twelve. A superb scene is that which you will then behold. The peers are robed all gorgeous and grand, and besides them are present peeresses, glittering with jewels, more grand and gorgeous still. In the ambassadors' box are the representatives of the different courts of Europe, and not unfrequently princes from "further Ind." The sound of the trumpet and the booming of cannon announce the arrival of her Majesty, who, attended by her consort and the chief officers of her court, takes her seat amidst her congregated peers. All rise on her approach, but she invites them to be seated, and the Chancellor, in her name, orders the Usher of the Black Rod to summon the Commons (who generally rush in in a most confused and disorderly manner, like so many schoolboys) to hear the forthcoming oration. Headed by the Speaker, the Commons at length arrive, order is restored, and on his bended knee the Chancellor presents his royal mistress with a copy of the speech, which has come to be, in our time, proverbial for its feeble elegance and unmeaning perspicuity. Having concluded, the Queen gracefully bows to the house, and retires with the same ceremonies with which she entered. The return to Buckingham Palace is by three at the latest. The address to her Majesty, in both houses, is moved at five the same evening, and in times when party feeling runs high, is generally looked forward to with great interest, as on such occasions the opposition puts forward an amendment. In the Lords and Commons generally, however, the address is but an echo of the royal speech, in an equally common-place form. The old custom of examining the cellars of the House of Lords about ten hours before her Majesty's arrival, is still kept up. The custom had its origin in the famous Gunpowder Plot. The examination is made by the Lord Great Chamberlain and the Usher of the Black Rod, with a detachment of the yeomen of the guard—a precaution we should have thought almost unnecessary in our time.

As more business is done in the lower house, we now turn to that. When the Speaker has got through his prayers, if more than forty members are present the house proceeds to work. This is the time for presenting petitions, the subjects of which are hurriedly stated by the member who presents them, and then given to one of the clerks at the table, who very quietly shoves them into a bag provided for that purpose. If people imagine, when signing their names to a petition, that the house will read the signatures, they are very much mistaken. The petitions over, and the Little Peddington water-cart bills and other private business being disposed of, the time for boring ministers commences. A metropolitan member rises to ask the Chief Commissioner of Woods and Forests whether he is aware of the disgraceful state of the Clerkenwell pump, or some other equally important matter. This important matter being disposed of, the attention of the noble lord the Secretary of State at the head of the Home Department is called to the distressing case of John Smithers, who was locked up by the police, in a violent and unconstitutional manner, on a charge of being drunk and disorderly, he, John Smithers, at that time and all other times, being quite the reverse. The Home Secretary having promised that inquiry shall be made into the matter, an independent member rises to put a question to the noble lord at the head of her Majesty's government as to the state of our relations with Timbuctoo; to which the noble lord replies by stating that despatches on the subject have been received at the Foreign Office, but that at present he has not had time to read them; but that he believes negotiations of a most satisfactory kind are going on at this moment, and of this he is certain, that whatever may be the result of those negotiations, in no case will the honour and interest of Great Britain be lost sight of. Then follows a member of the opposition, who wishes to know the intentions of the government with regard to parliamentary reform, vote by ballot, the Maynooth grant, or some other subject on which it is scarcely possible for ministers to give an answer without either committing themselves too far, or exciting discontent among their adherents. These affairs being disposed of, legislation begins in earnest.

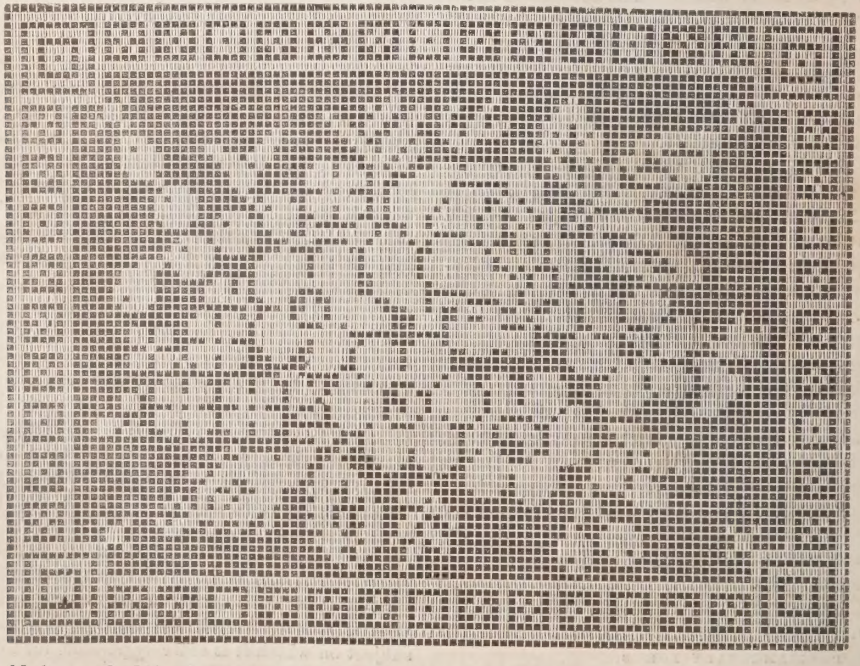
FLORAL ANTI-MACASSAR.—IN SQUARE NETTING AND DARNED.

MATERIALS.—Brook's Goat's Head Netting and Knitting Cotton, No. 36. Brooks' Embroidering Goat's Head Cotton, No. 40. Rather a fine Embroidering Needle. Steel Mesh, No. 12. Steel Netting Needle.

Work the same number of squares, as in the engraving, by commencing on one stitch, and increasing one at the end of every row till you get sufficient length of one side; and then decrease one at the end of every row by taking two loops into one. Then darn according to the engraving.

Make sufficient number of tassels to go round. Wind the cotton over a card three inches wide, cut one end, and draw through the loop of netting, and make four more tassels larger; over a card six inches wide for the corners. Six squares measure one inch.

ARABESQUE TOILET-COVER IN SQUARE CROCHET.



THIS pattern should be worked in Brooks' crochet cotton, exactly to the size of the top of the table, in rather thick cotton, to make it look massive, and to retain its form; the edging must be worked in blue beads in crochet to the pattern, and a number of beads given exactly to go round the table and to hang down, and finished with a tassel at each corner.

GROUP OF VASES—DEPARTMENT OF PRACTICAL ART, MARLBOROUGH HOUSE, LONDON.

SEVRES PORCELAIN VASES.

Sèvres porcelain has, for nearly a century, maintained a world-wide celebrity. To possess specimens of this, or of Dresden China, has been frequently the highest ambition of wealthy, but tasteless, curiosity-hunters. It was the costliness and rarity of these works, rather than their beauty, which so frequently excited the hopes and fears of the fashionable attendants upon the auctioneer's hammer; and if we follow these specimens of the potter's skill to their destination, it is generally to find them grouped with the rude and uncouth deformities of the Celestial empire.

Royal manufactories of porcelain exist at Berlin, Dresden, and Sèvres; the latter was established in the reign of Louis XV., and, probably, owes its origin to the whim of some court favourite. Be that as it may, under the fostering and intelligent care of the French government, it became, either from necessity or policy, a scientific school for the improvement and perfecting of the ceramic art—in fact a model school for manufacturers in plastic materials.

The first attempt at establishing this manufacture was made in 1738 at the Chateau de Vincennes, and in 1755 it was removed to Sèvres. The establishment comprises a museum, and an *experimental* and a *model* school, the combined aim of which is to attain the highest excellence both of form and materials. The first object, that of excellence of form, is promoted by the museum, which contains not only an extensive collection of the best classic models, but also specimens of every known variety of pottery and porcelain of the past and present ages. Samples of the earths, clays, pigments, and other materials which enter into their composition and decoration, with specimens of vessels in every stage of manufacture, and others exhibiting the various accidents to which they are liable in *firing*, glazing, &c., are arranged with the best effect to facilitate study.

The object of the experimental department is to attain the greatest perfection of *material*, by suitable combinations of different clays and other substances, materials for glazing, &c. This is accomplished by the employment of the highest scientific skill. It is due to the credit of M. Brogniart, the eminent geologist, to state that the greatest perfection of this manufacture has been attained since the establishment came under his able superintendence.*

The result of all the experiments made in this great laboratory are available by other manufacturers, to whom every information is liberally imparted. But notwithstanding the same materials are used and similar processes followed, Sèvres porcelain is of finer quality than that of any other manufactory in France. Yet, although its products are sold at very high prices, and are constantly and extensively in demand, they do not repay the cost of supporting the establishment, which is partly maintained from the civil list.

The original manufacture of Sèvres porcelain was of a very delicate and friable nature, in fact a kind of glass, termed *porcelaine tendre*, differing vastly in composition and appearance from that now made, which is termed *porcelaine dure* or hard porcelain. These early productions were impressed with the false taste of the court of Louis XV., in which every feeling for art was distorted and perverted by affectation and a love of the singular rather than of the beautiful. Gaudy decoration, unmeaning and excessive ornament, disfigure these works, so that it becomes a matter of congratulation that they were composed in so tender and friable a manner as to be little likely to withstand the shocks of many years' exposure to accident. The *porcelaine dure* is, however, of a very different quality; here we find the greatest known perfection of material combined with the choicest and purest artistic forms. The most refined scientific ability, united with pure taste and skilful workmanship, contribute to the production of these elegant works, which may truly serve as models, not only to the manufacturers of France, but to those of our own and other countries. And there can be little doubt that much of the improvement observable of late years in our fictile manufactures, is due to the productions of the ateliers of Sèvres no less than to the genius of Wedgwood and Flaxman.

The productions in Sèvres ware are, as our engraving shows, ornamental rather than useful, hence they may properly be regarded as works of art. Vazes, tazzes, chalices, &c., display pure classic forms, rarely disturbed by reliefs (the overloading with which is the common fault of works of this class, executed in an inartistic spirit); but when they do occur they always possess merit, and not unfrequently exhibit a rare degree of excellence. The painting is the work of artists of high qualifications, nearly 100 of whom are constantly employed at the manufactory. The subjects are infinitely varied—landscapes, figures, flowers, together with ornamental forms, and are of the greatest excellence, which our engraving exhibits as far as is attainable. In all these respects the manufactures at Sèvres maintain a great superiority over those produced at another royal manufactory—that of Dresden, which appears to have never emancipated itself from the trammels that encompassed it at the time of its zenith of prosperity, the tinsel age of Louis XV. The characteristic features of the productions of Dresden are contorted forms and affected prettiness; while the ornamentation is overloaded and excessively elaborated in its imitations, or rather *copyings*, of natural forms and subjects. The colouring is generally gaudy, chiefly for want of proper harmony of contrast, as the objects imitated are, individually, carefully studied from nature.

But whatever be the faults chargeable upon some of the Dresden productions, it must be admitted that those of our own country are in many instances open to objection on the score of taste. With all our manufacturing ingenuity, our inventive skill, and our commercial enterprise, we are unquestionably behind our neighbours in elegance of design and tastefulness of decoration. Our manufacturers are content to borrow or steal designs from whatever quarter they can get them—a proceeding which is both discreditable and injurious to us as a nation. It is a most short-sighted policy to place ourselves so much at the mercy of foreigners. For though it is not likely that the unrestricted intercourse now established and daily extending among the nations of Europe will ever be interrupted for any great length of time, yet we should bear in mind, that this very facility of international communication may operate unfavourably upon the high position which England has occupied as the great workshop and mart of the world. If nothing but capital is needed to enable our rivals to turn their superior taste and skill to the best account, this will certainly not be long wanting, for capital will always flow into remunerative channels; and unless a decided improvement takes place in the artistic culture of our countrymen, we may soon find ourselves superseded.

Happily, both government and people are, we trust, at length becoming alive to the necessity of taking some steps to improve the taste of the people—especially that part of the population engaged in manufacture. In 1837,—a committee of the House of Commons having recommended the establishment of an institution in which "not theoretical instruction only, but the direct practical application of the arts to manufacture sought to be deemed an essential element,"—Schools of Design were started under the patronage of government, and there is now scarcely a manufacturing town of any importance without one. Another step in the same direction was the formation of the Department of Practical Art in February, 1852, which may be reckoned one of the most beneficial results of the Great Exhibition in the previous year. The beautiful vases represented in our engraving are among the objects there exhibited for the inspection of the public and the study of art pupils. They are, as the reader may perceive, well worthy to be regarded as models for the imitation of our young artists. Their elegance of form, tastefulness of decoration, and finish of execution, render them admirably adapted to elevate and purify the taste.

* The present chemist to the royal manufactory at Sèvres is M. Salvetat.

JAPANESE MYTHOLOGY.

Having already entered into a lengthened description of the Sintoo creed, or primitive religion of Japan, we now proceed to furnish the reader with some explanation of what the illustration which accompanied our remarks was intended to represent, that he may be able more easily to comprehend the artist's design. The first figure which attracts the reader's attention is that of the many-armed warrior, at the top of the picture. His name is *Maris'*, and tradition calls him powerful, persevering, brightly flaming. We recognise in him Aries, Mavors, or Mars, that mighty deity of the ancient Scythians and Thracians, that tutelary divinity who passed over with the Pelasgian hordes to Greece, and whose sons founded Rome, the city of the seven hills.

Thus do we find, at the extreme opposite ends of Asia, the same idol, whose birth-place was central India. That this idol did really first come from India, is proved by the first syllable of his name, which is seen upon his shield in the old work, *Devanagari*, and his appearance, costume, and arms, lead us to the same conclusion. The religious books of the Japanese have adopted him as the type of force and power. His qualities are still more plainly indicated by his companion and supporter, the wild boar, which is especially sacred to him, and is a type of strength and warlike courage.

To the left of *Maris'* we behold the holy *Foo*, who appears in the Japanese and Chinese sagas as a being who always forebodes good fortune and happiness. This bird-like being is very generally used in the decoration of all works of art, such as paintings, statues, or metal-work, and is especially adopted as an ornament for the household shrines that are to be found in the residences of the Japanese. The feathered creature to the right of *Maris'* is *Tengu*, the guardian of the heavens, herald of the gods, and protector of the kamis and their shrines, or *Mias*. This idol belongs to the Sintoo worship, where it is sometimes represented in human, and sometimes half-human shape, while at others it is pictured under the form of a perfect bird. It is placed at the principal entrance of the Sintoo temples, as a safeguard against evil spirits. It is also borne at the head of all the processions that set out from the temple before which it is placed.

In our engraving we have a representation of one of the many popular legends of Japan, namely, the fight of a hero with an eight-headed dragon. A painting of this subject, in very gaudy colours, is often to be seen in the Sintoo temples; and the priests of the temple which is erected to the hero of Yamato, near Atsula, still relate it to the faithful. According to their account, an eight-headed devastating monster used yearly to appear in Yamato, and was to be appeased only by the sacrifice of a virgin descended from a race of kings. At last, however, a mountain hero, *Yamato-take*, came across the fire-belching monster, and engaging in single combat, killed it. This hero was, as history informs us, *Amano-mura humo*, a son of the Mikado *Kei-koo-ten-woo*, and a youth of rare strength and uncommon courage. His heroic deeds are recounted in the Japanese annals, which still preserve the memory of his conflict with the savages, who threw fire at him, but whom he destroyed by fire. They also mention in high terms his flame-like sword, which is now preserved as one of the three jewels of the empire. The Japanese used really to believe in the existence of monsters similar to the eight-headed serpent destroyed by the hero, and think that they were servants of the goddess of the sun, who sends them upon the earth to punish men for their misdeeds.

The above fable cannot fail to bring to every one's mind the combat of Hercules with the Ternæan hydra; and when the Japanese account goes on to state that *Koo-kano-samuroo*, a friend of the hero, descended with the latter to the infernal regions, where the monster dwelt, and that he held a torch while the combat was going on, we are still more struck with its resemblance to the Greek tradition, in which Iolas seared the neck of the hydra as Hercules cut off the heads. The rock on which the hero is represented in the drawing as placing his foot, may easily have given rise to the fiction of the rock under which Hercules buried the hydra. Th swampy dwelling of the latter is easily recognisable in th sketch.

Like the fables of all the ancient gods and heroes, the allegorical personages float in a kind of indistinct manner ov Japan. All around them, however, are a number of typic forms relating to art, science, husbandry, and commerce, a which, as being sprung from facts and not fiction, appear in much clearer and stronger light.

The reader will doubtless be struck by the bird-like vess to the left. It is a representation of the *Tori-kame*, which h stood for ages, as large as life, before the Temple residence the Mikado, and is a proof of the proficiency that creative s had attained at a most remote period.

Opposite this vessel, and borne by a Sintoo priest, is one the five heavenly musical instruments, namely, the big drur According to the popular belief, the great goddess that ligh the heavens suddenly disappeared, and night lay upon t face of the celestial land. Having been affronted by man, s concealed herself in a cave, whence music alone could dra her forth and cause her to be reconciled to man. So high origin do the Japanese assign to Music.

The fan, made of the plastic wood of the *arborritæ*, a decorated with evergreen creepers, was in olden times co sidered an ornament for the prince's hand. At the present d we still see, at the court of the Mikado, the fan as simple a as plain as ever, in remembrance of the old manners a customs of the country; while, as the nation became mo civilised and advanced, its taste for magnificence in all oth objects save this one became more and more pronounce witness the costly stuffs of gold and silk of which the Japane are at present so fond.

The Japanese husbandman was acquainted with *Maize* lo before European nations were, and he has also cultivat *pumpkins* and *melons*, that have become acclimated in countries of the globe for countless centuries. These natu products may be taken to indicate the flourishing state horticulture and agriculture in Japan, but they may likew be taken as evidence of the intercourse which must, in t earliest times, have united nations that were separated fr each other by wide and surging seas.

The reader may, perhaps, at first be inclined to believe th in the *Bow* he simply beholds an ancient specimen of t national weapon. But the philologist will see in it more th the form of a mere weapon, and recognise the Chinese char ter signifying a bow, and taken from among those charact which belong to the infancy of the art of writing, which, a appears in its present more mature condition, is represented the little books opposite the bow.

Turning to another part of the picture, we behold Jap commanded by the remarkable volcanic mountain, Fusi, a lighted by the rising sun. Cheerful industry ploughs valleys and cultivates even its mountain sides. Secure a free from apprehension, commerce and activity go hand-hand and animate the shores and harbours with countl sails.

In the foreground we behold, in a sitting posture, Mikado *Teu-tse-teu-woo*, who reigned during the second hal the seventh century according to our reckoning. To t prince does Japan owe the rise of the arts and sciences. was the first to found public schools and erect temples honour of the Chinese philosopher Confucius. The Chin characters which, at an earlier period, had been introduced i Japan from Futara, a province of the neighbouring country Corai, were by his exertions spread through the entire emp This prince, too, who was himself a poet, endeavoured elevate his native language; and the services he rendered this particular still place him, even at the present day, at head of the hundred poets who wrote in the old Jamato l guage.

By the Mikado's side, and standing out from the group armed warriors, is the figure of his general, the Ziogoon. have selected, in preference to any others, the portrait of celebrated hero *Josimits'*, who lived in the twelfth century,

e sake of showing the peculiar style of accoutrements worn those days.

The portion of the drawing opposite the Ziogoon has refer- ce to the *people*, their *habits*, and *customs*. It represents a scene m the ceremonies observed on the occasion of the new ar, and shows a reigning prince, in the character of a father a family, inviting good fortune into his house, and hoping at ill-luck will not enter it. He goes, at midnight, in state parel, through his house, throwing about him, on all sides, asted beans, and crying, "Evil spirit, avaunt; treasures, me in!" The impersonification of the evil spirit is worthy remark, because it represents the devil as the people are ight to conceive him in the doctrines of Buddhism. It is th the greatest unwillingness that he obeys the exorcism mpelling him to depart and allow riches and treasures to cupy his place.

The small chapel which rises in the background on a pyra- dical pile of masonry, represents an ancient Sintoo sepulchre. e masonry consists of roughly-hewn blocks of basalt, and exactly similar to the well-known Cyclopian walls. The lls of Japanese temples and fortresses are always built in is manner. The pillared gateway leads to the sepulchre, as peculiar to the Sintoo faith. The pillars of such gateways e made of wood, stone, or bronze. They often rise to an mense height, and constitute a distinctly separate order in chitecture.

In the foreground of the picture are some very remarkable jects which we have not yet explained. The three-footed ssel will afford the antiquary copious matter for comparison. e ornament in the form of a crocodile on the cover, the toise heads at the bend of the legs, and, in a word, the ole form of the vessel will not be viewed by him with indif- ence, when he finds similar ones upon the continents of ia and America. In Japan this vessel is used as a censer the altar of the tutelary household god.

The *magatama*, or crooked jewel, as well as ornaments and money of the ancient Japanese, are lying near the Chinese coin *hanrioo*, which was cast in China in the reign of the Chinese emperor Zîn Schi Hoâng-ti (220 B.C.) and brought to Japan, at a very early period, by Chinese immigrants.

As an instrument for giving the key-note, we see the old Pandean pipes, and as the war-trumpet, the shell of the Tritons. Among the warlike weapons, we perceive the axe of the Roman forces. We have, also, a representation of the magnet, which, as early as the seventh century, is mentioned in the Japanese annals as being a *wheel that indicates the north*. This proves it to have been known to other nations before it was discovered by the Europeans.

Considering the veneration paid to the goddess of the Sun, *Maris'*, who was introduced into Japan at a much later period by the disciples of Buddha, and who is merely a god of an inferior order, occupies too elevated a position, if considered as the type or impersonification of the religion of the country. The picture, however, may be satisfactorily explained in the following manner.

Maris', the god of war, hovers over the empire of Japan, which owes its foundation to *Zin-mu-ten-woo*, the heavenly warrior, who united the various wild tribes into a nation, and was the ancestor of a dynasty that has lasted for more than two thousand years. *Maris'*, therefore, is with propriety represented as continually floating above Japan, warding off evil with his many arms. *Foo*, the blessing of heaven, looks mildly down upon the peaceful mountains beneath him, while *Tengu*, the heavenly watcher, waves over this land of gods (*Zin-kok'*) his sword against its foes. Bold and strong, *Yamato-take*, the conqueror of the many-headed monster, typifies the race of heroes who have at various times arisen from among a people which never bent beneath a foreign yoke, and which was never conquered since it was a nation.

THE VIVARIUM IN THE ZOOLOGICAL GARDENS.

IE organs of sight and hearing in the crustacea are small; eir eyes have but very little power of sight, while their organ hearing is at the external base of the antennæ, and is com- sed of a membrane like that of the tympanum, above which a kind of cell full of liquid, where ends a nerve. Not ich is known as to their sense of smelling and taste. Most e on animal matter, and very few imbibe any liquid matter. ieir blood is white, or rather of a lilac tinge. The heart is uated in the middle of the back, and has but one cavity. s contractions drive the blood to the arteries, which dis- bute it over the body. The veins are very incomplete. The ustacea being aquatic, their breathing is similar to that of her aquatic animals, though some breathe through their in.

All the crustacea are oviparous. The female, after laying r eggs, keeps them for some time hanging under her stomach, even among the numerous flaps of her tail, The young idergo scarcely any change after their adult age, except the crease of the number of their claws.

It would occupy too much time to describe all the genera of e class of crustacea. The Decapod Crustacea are the most merous class. The head and thorax of these crustacea are nfounded in a single mass, covered by a carapace. This rsal buckler projects beyond the forehead, descends on each le to the edge of the paws, and goes back to the abdomen. he sea and land-crab are of this race.

A very common crab is the *Cancer puber*, which is covered r a yellow head of down, and has black claws. The *Cancer rsor* of Linnæus, or running crab, which is found on the ores of the Mediterranean, runs with such velocity, that a rse at a gallop can scarcely catch it. During the day this imal lives in holes dug by himself in the sand, and comes t only at night. In the Indian Ocean there is discovered, in great numbers, a crab called by naturalists *Podophthalmus spinosus*, which has very long projecting eyes. The *Cancer ruricola*, which the French have christened the *Tourlourou*, or raw recruit, is blood-red, with yellow spots, which form the letter H very distinctly. This species is very common in the West Indies. The *Tourlourou*, instead of living in the water, dwells in damp woods. It breathes, however, in the same way as the water-crab, by the gills, which, however, require more oxygen than water can dissolve, and act in the air like lungs. Nature, to prevent their drying up, has placed at the bottom of the breathing cavity sometimes a sort of cell, which receives the water necessary to maintain humidity round the gills; sometimes a spongy membrane in the vault of this cavity.

These animals live chiefly on vegetables, and are nocturnal and crepuscular. They dwell in the hills, sometimes a long way from the sea; during the rainy season, they quit their land habitation, to go down to the water. They congregate in large troops, and start on their journey. The traveller who is delayed at night in South America on his road, will often fall in with this singular army crossing woods, fields, and rivers at a rapid rate; checked by no obstacles, and sweeping all before them in their ravages. These periodical journeys are taken in time to renew the water in their gill-supplying cells. Doctor Lamaout says: "Admiral Drake having landed, in 1605, some of his crew on a desert coast of South America, these famished crabs fell upon them, bit their legs, upset them, and devoured them." We fancy this must be a traveller's tale.

The sea spiders are a kind of crab with very long claws. The *Maia squinado*, or *Cancer maia*, is of this kind. It is four inches long and three broad. Its back is all covered by hairy pimples. This species is very common in the ocean and in

the Mediterranean. The ancients considered it sacred to Diana of Ephesus. They attributed to it great wisdom and a love of music. On many Greek medals are fac-similes of this crustaceous animal.

Craw-fish and lobsters have their tails at least as long as their bodies. They are naturally swimmers, scarcely ever come on shore, and seldom walk at the bottom of the water. They keep moving about, and the vigorous movements of their tails impel them forward with great rapidity. Lobsters are crustacea with cylindrical antennæ, very long and covered with prickly points; their paws are without claws, while on their forehead are two long bending horns. Such is the common lobster (*Astacus elephas*), of which we give illustration (fig. 1). This is often a foot and a half long, ar with its eggs, will weigh twelve or fourteen pounds. Its armo is thorny, and covered with a kind of down. The back is o greenish brown, and the tail is dotted by yellow spots. T race inhabits the coasts of the milder climates of Euro

FIG. 1.—THE COMMON LOBSTER AND THE HERMIT CRAB.

During the winter they remain in the depths of the sea. the spring they come out to the shore, and lay their numero and ruddy eggs in the holes of rocks.

The sea craw-fish (*Astacus marinus*) often reaches an immen size, even more than a foot and a half long. This crustace is found in the European seas, and on the coast of America.

The Palemons include the prawns and shrimps. The *Palæmon serratus*, or common prawn, represented in our drawing (p. 221), is from three to four inches long. It is of a pale-red colour, and is a favourite article of food with large portions of the inhabitants of Europe. A little parasitical crustacean is often found upon them, the *Bopyrus crangorum*, which by certain fishermen is taken to be the young sole.

The hermit crab (*Cancer bernhardus* or *Pagurus*, fig. 1) has a large abdomen, which projects backwards in a very peculiar way. The hind quarters of the animal are thus exposed to continual assault. But what nature has refused, the strange instinct of the animal provides. The hermit finds a univalve shell, in which it inserts itself by means of its hind claws; this parasitical protection it drags after it everywhere, and even sometimes gets into it altogether, its fore paws being alone visible. Every year, in the early months, when the

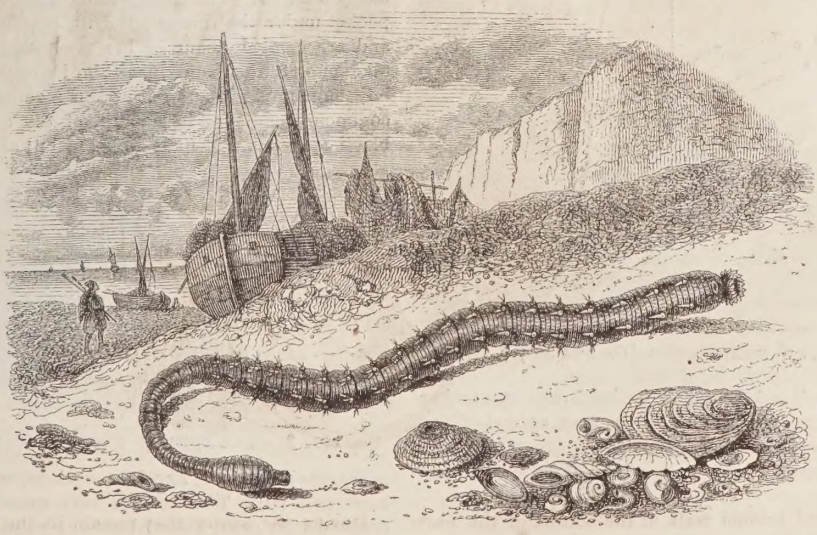

FIG. 4.—THE FISHERMAN'S SAND-WORM (*Lumbricus marinus*).

animal changes its skin, it goes about looking for a fresh shell —a shell more proportioned to its new growth. The crab may be seen lodging-hunting with all the care and precision of a particular old maid. It pokes its nose and then its tail into every spiral shell it meets, until it finds precisely the fit it wants. As soon as the brute finds one which thoroughly suits it, the old house is cast away, and the new one popped into with the utmost agility. The shell sticks so fast, that you can only get the crab out by using fire. Many different names have been given to this animal—the soldier, Diogenes,

FIG. 5.—THE VERMICULAR SERPULA (*Serpula vermicularis*).*

the hermit—all of which are significant enough. A very correct representation of it is given in our engraving.

The *Birgi* are great crustacea of the Indies, somewhat like the *Pagurus*. The most remarkable of the species is the *Cancer latro*, or robber crab. This animal leaves the sea at night and climbs up the cocoa-nut tree to steal the fruit, of which it is very fond. Some of our young readers may recollect a humorous scene in illustration of this, in the "Swiss Family Robinson." This animal, by its peculiar habits, brings to the knowledge of the naturalist a singular anomaly in amphibious

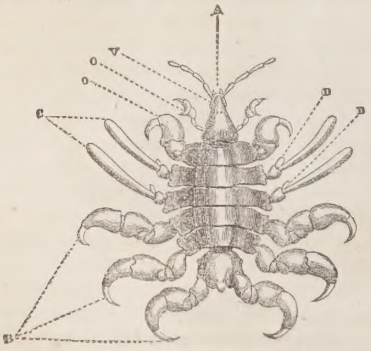

FIG. 6.—THE WHALE-LOUSE (*Oniscus ceti*).†

life. The robber crab is followed in its land trips by another animal, breathing through the gills. A rare animal of the *Bercha* species, the *Perca scandens*, also quits its natural element as if in search of the crab, which it follows to the trees where it is feeding. The *Perca* is peculiarly constituted to retain a certain quantity of water to moisten the gills, which, by the closing of their extremities, are preserved from the air.

There are many other minor crustacea. One of these is the *Oniscus ceti* (fig. 6), found on the body of the whale, and on the mackerel. The *Oniscus asellus*, or common woodlouse (fig. 9),

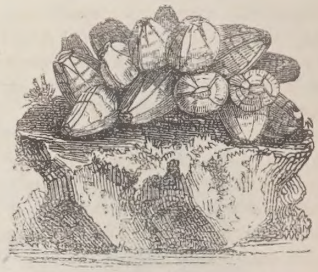

FIG. 7.—THE FURROWED SEA-ACORN (*Lepas balanus*).

and its varieties, are well known in our houses and gardens. It is a small animal, with eight rings of shell. Its gills are under the front scales over the tail. They roll up into a round ball when touched, which makes them an object of wonder to children. These animals frequent retired and dark places, and are found often under stones. They feed upon corrupt animal and vegetable matter, and rarely come forth, except in

FIG. 8.—THE FURROWED SEA-ACORN (*Lepas balanus*), FULL GROWN AND OUT OF ITS SHELL.

damp weather. The female collects her eggs in a membranous pocket under the thorax; the little ones come to life there, and are carried about by her everywhere she goes. If you take one of them and turn it on its back, the little ones may be seen running in and out of the membranous pocket. The common woodlouse is smooth, of the colour of ashes, with black spots, and a little yellow; but some are found in the

FIG. 9.—THE COMMON WOODLOUSE (*Oniscus asellus*).

country which have, like it, ten rings, without counting the head and tail. The front is very smooth, of a brown hue, specked with gray, but without any yellow spots. The armadillo woodlouse is broad, smooth, and shining. It is black, with a little white about the edges of the rings. Of the first ten rings which compose its body, without counting the head and tail, the first seven are wide, and the three others are narrow.

* 2, The animal in its tube; 3, The animal out of its tube; 4 and 5, Extremity of a gill.

† A, The mouth; V, The eyes; o o, The first pairs of feet, the anterior of which is fixed below and behind the head; B, the third, fourth, and fifth pairs of claws; C, Appendages of the second and third segments, having at their base the orifice of the respiratory organs, D D.

Passing from these to the cirrhipedes, we find them to be a link between the crustacea and the mollusca. They all belong to the sea, swim freely when young, and then fix themselves for ever on some submarine body. They adhere by the back. Their form is elongated, their bodies are bent, and contained in a shell of several parts. They have no eyes, their mouth is like that of the crustacea; the lower part of their body is composed of two ranges of grisly lobes, with two horned appendages with numerous projections. These, about four and twenty in number, the animal keeps constantly in motion, and thus draws within her little vortex the animalcules on which it feeds. They have their heart in the dorsal part of their backs, and breathe through gills.

The *Lepas anatifera* is enclosed in a kind of gauzy cover, suspended on a fleshy tube. This tube serves for them to fasten on to rocks and bottoms of ships, where they are known as barnacles. There was a time when birds were said to grow out of them. The sea-acorns are a small species of the cirrhipede group. They are enclosed in a short shell (figs. 7 and 8).

The class of worms are divided into annelida, rotators, and intestinal worms. The worms of the order of annelida have red or highly-coloured blood. This analogy with the superior order of animals made some naturalists place them at the head of articulated animals; but in every other point of their organisation they are compared to insects and crustacea. Their body is long, soft, and divided into a great many rings. Some have little spots, which have been suspected to be eyes. The mouth is at the extreme end, while they breathe, some in the ordinary way, some by gills.

The wandering annelida have the organs of respiration fixed upon the lower part of the body, or throughout the whole length. They have little silky knobs, which serve as feet. They swim and walk, and live generally under stones, among shells or fixed in the sand. A kind of mucous secretion spread over the body collects a tubular sheath round them, in which they dwell; but they can leave it at will. They are of the sea, and very numerous. Some only can be quoted. The *Lumbricus marinus*, or fisherman's sand-worm (fig. 4), is about ten or twelve inches long, and has no gills, save in the middle of the body; its head is not defined, and presents neither antennæ, nor eyes, nor jaws: fishermen use it as bait. When taken up in the fingers, they exude a liquid which stains the skin. They are found two or three feet deep in the sand, and their retreat is marked by the pile of sand ejected from the hole they make.

The tube-dwelling annelida have no distinct head, no jaws, no eyes, no antennæ; but towards the tail are numerous appendages doing the office of all these members. They inhabit a tube. Such are the serpulæ, which live in calcareous tubes, upside down, with a tufted extremity, as will be seen from the cut (fig. 5). They have been called sea-brushes. The particular specimen given is the *Serpula vermicularis* of Linnæus, found in the European seas. There is one little known member of this division, the *Dentalium elephantinum*, which lives in a regular tube, slightly arched, and open at both ends.

The common earth-worms (*Lumbricus terrestris*) are, as every one knows, red. They feed on animal and vegetable matter. They are the only ones which do not live in water. They breathe through their pores, and multiply by the division of their bodies into one or more parts.

The division of sucking annelida have no silky down on the skin. They have at each end a dilatable and catching cavity, which acts like a cupping-glass. The animal fastens on to anything firmly by this means. The mouth is at the bottom of the anterior suction organ, and is armed with jaws, while there are spots around, which may be eyes. All feed on other animals, which they suck or swallow. Some fasten on to fish and frogs; some devour mollusca and the larvæ of insects; some fasten on to animals, and even to men when in the water. Some are known to enter the mouths of horses when drinking, and creep under their tongues, or into their throats. Such are the leeches, which have an oval organ of suction, ten eyes, and jaws armed with teeth. When a leech wishes to get through the skin of the animal to which it is fixed, its fangs are fastened upon the skin, the tubercules which support the jaws stiffen, contract, and the dental appendages cut the skin. Three little wounds are made, like the letter Y, whence the blood issues drop by drop, and passes into the animal's vast stomach. Every one is aware of the use made of these, and to many our design will be more familiar than agreeable. Of late years the use of leeches has become so general, that these animals form an important branch of commerce. The ponds of Spain and France have been entirely cleared, and they are now brought from Hungary and Turkey.

The medicinal leech (*Hirudo medicinalis*, fig. 2) is from four to five inches long, with ninety-eight equal rings. The opening of the mouth is found longitudinally under the upper lip, while the belly is olive-coloured and spotted with black. The mode of reproduction in leeches was very little known until recently. They are oviparous. The eggs, to the number of eight or fifteen, are surrounded by a membranous capsule, which is covered by a regular cocoon; this cocoon is formed of a semi-transparent tissue. The young leeches creep out of a small orifice at the proper time (fig. 3).*

The rotatory worms have only been known since the discovery of the microscope. As long as this instrument only magnified them a hundred-fold, no distinct organ could be seen in their interior, and they were quoted as examples of a kind of animated jelly, feeding by absorption. But modern naturalists have, by means of powerful instruments, discovered that their organisation is only apparently simple. One of this division, the *Furcularia rediviva*, has been made celebrated by the experiments of Spallanzani. It lives in fresh and salt water, and is found in gutter-pipes of houses. Its life is suspended by loss of humidity; but when it has been apparently dead for weeks, it suffices to damp it with one drop of water to give it life and motion.

The last division consists of those worms which are capable of existence only in the interior of other animals, which lodge in the liver, the eyes, and the digestive canal. They are oviparous and viviparous. The tape, or solitary worm, is well known. There are many individuals of this species. All animals are subject to them. They cause sickness, thinness, devouring appetite, suffering, and even death. The *Tænia vulgaris* has reached three hundred feet in length. Boërhaave freed a Russian nobleman of one as large as that. They are, like the *Tænia solium*, very difficult of extirpation. Some are found in the brains of sheep, others in the liver of animals and man.

The mollusca and the zoophytes form the last divisions of zoology. The mollusca include oysters, snails, &c. They are without spinal marrow and any interior skeleton. Their nervous system is composed of several medullar masses, disposed at different points, and of which the principal, which may be called the brain, is situated across the œsophagus. They are extremely varied in form, soft, and with the muscles adhering to the skin. In most instances they have shells. In nearly every case, the beautiful and varied shells which are so much admired are only coloured on the outside.

Of the zoophytes little more can be said. Below them are other aquatic creations, which were thought to be produced spontaneously in water where animal and vegetable matter had been infused. Their mode of multiplication is even yet disputed. It is, however, now pretty generally allowed that they propagate by the division of their bodies into parts. They are in some instances so small as scarcely to be conceived. Imagine an animal one-2,000th part of a line in diameter, digesting his food in a stomach the coats of which are one-6,000,000th of a line in thickness! Still we have not arrived at the most infinitesimal product of creation. Leuwenhoeck and Malesieu have studied animalcules, of which 10,000,000 united would not reach the size of a grain of sand; and others 27,000,000 of times as small as a mite, which is invisible to the naked eye.

* *Note to fig.* 3.—1, Capsules recently laid; 2, A capsule developed; 3, A developed capsule, showing the eggs; 4, A capsule containing the young leeches about to be hatched; 5, A leech lately hatched; 6, Mouth of the full-grown leech, showing the three triangular jaws.

WOOD SCENERY.

Woods and forests are distributed over the earth with more or less abundance. The great variety and the diversified foliage of trees present a beautiful picture to the eye, while the wood which they furnish contributes greatly to the necessities and comforts of mankind. It is to forest trees especially that we are indebted for great part of our houses and ships, for fuel, and for various implements, furniture and utensils.

WOOD SCENERY.

In those countries where bituminous substances suitable for fuel are scarce, and can only be obtained at a considerable expense, the most extensive forests grow; and though man reaps the benefit, he has but little share in their cultivation. Trees grow and multiply spontaneously. The woodcutter comes at the fall of the year and thins the plantations, filling vehicle after vehicle with trunks or loppings; but new shoots are thrown out the next spring, the spaces are again filled up, the loss is more than repaired, and a sufficient quantity is always found to supply the wants of man. This distribution of woods and forests is a remarkable proof of Divine wisdom and goodness.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER XVI.

ACCUSATION AND ARREST OF ROBERTO DI RECANATI.

All this, and much more which we have omitted, did Zeno address to the captains around him. While they burned with anxiety for the disclosure of the plot and the persons engaged in it, the novelty and solemn nature of the appeal made each hesitate to speak before his neighbour. But this suspense did not continue long. Sir William Cheke stood up, and glancing

round the company, read in their eyes that they would willingly have him as their spokesman.

"Noble general," said he, addressing Zeno, "I know well those around me; companions in arms have we been in many a battle-field and bivouac, and I dare venture to express their feelings as well as my own. Am I not right, my brothers?"

There was an unanimous expression of concurrence amongst the captains, and Sir William proceeded—

"Signore, we heard your first words to-night with great pleasure; for it made us both proud and glad to find you bearing such generous testimony to our conduct as soldiers, and to learn what trust you and the most serene republic repose in us. In all our names, I thank you. Be well assured we shall never forget what we owe to you, whom we have found to be not only a general, but a father. But you quickly dispelled our pleasure; for truly we are grieved and horrified to think that there are in the camp those who dare to meditate such crimes. Shame! eternal shame and infamy be upon them! they are a disgrace to our order, and a stain to the brightness and honour of the military profession!"

A simultaneous cry of "Vergogna! Vergogna! Infamita ai traditori!" showed how thoroughly all present shared in the indignation of the honest English knight.

"But whatever be the danger that impends us all," continued Cheke, "we know well that you can cope with it. We know how you watch over the common safety; we know your vigilance, your astuteness, your genius. Nor shall we, noble Zeno, disappoint your estimate of us. Here we are, assembling promptly at your command—cheerfully we place ourselves in your hands—use us at your pleasure; not as mere paid troops, but as friends bound to you by many a kindness. We beseech you then, messer, trust us fully: tell us, at once, the names of those traitors, that we may slay them with our daggers. Brothers," said he, turning once again to his companions, "swear that you will stand by our general; that you will pursue the traitors to the death, let them be the highest in rank or the noblest in blood."

"We will! we will!" was the response of every voice.

A smile of stern exultation passed over the face of Zeno. He was now thoroughly assured, as he looked from one to another of those whom he had assembled, that there was not a false heart amongst them, and with the support of that number, he felt that he might brave and bid defiance to all who were disaffected.

"My friends, you ask to know who is the traitor; you shall see him ere long. I marvel he is not here by this time, for I have ordered him to be summoned."

Such indeed was the case; for no sooner had Zeno concluded his address, and found that he might depend upon the fidelity of so large a portion of the mercenaries, than he had privately despatched Alexis to request the instant attendance of Recanati.

The young Greek found the condottiere, who had manifestly not yet retired to rest, and was still partially armed. He received the message with an inward dissatisfaction, which, however, he took care not to exhibit, and contented himself with replying that he would attend. But, in truth, the summons of the general caused the wily captain no small anxiety, and he revolved the matter again and again in his mind without being able to see his way. Could it be that Zeno had by some means become apprised of the plans which he was so soon to carry into execution? The thought was startling, and the heart of the traitor sank within him as the terrible suspicion crossed his mind. If so, it would be madness to obey the summons, and throw himself, as it were, into the very jaws of a roaring lion. And yet what would a refusal avail him? Could he brave the rest of the troops, should they side with Zeno, with his own lancers? That was indeed a hopeless chance. But after a little his heart took courage. "No," thought he; "it is impossible that my schemes have transpired; they have been too well laid and secretly for that. The Genoese spy reached me safely: had he failed in effecting his return, I should have discovered it ere this; and so, after all, this summons is but a casual one, very inopportune, I admit, but I will despatch it as speedily as I may, and then——" And with such thoughts Recanati set forward to the general's quarters; but as he passed out he called his lieutenant aside, and hastily said, "Should I not return in half an hour, you will lead a company of lancers, fully armed, to the general's quarters: I shall have need of them there. It is as well," he thought to himself, "to provide against the worst; and now to meet this man, who will thrust himself ever in my way, till I am forced to remove him."

Meantime, Zeno and the captains still waited the arrival of him who was announced as the traitor. The silence which had lasted for some minutes was now becoming insupportable, and the leaders began to look anxiously around them and to whisper amongst themselves. Just at the moment when one of them was about to address the general, the noise of feet was heard outside, the door opened, and Recanati, attended by Alexis, entered the apartment. Despite of his habitual wariness and self-control, Recanati could not suppress an expression of astonishment as his eye hurriedly took in the scene before him; but in a moment he was calm and self-collected. He felt that the crisis of his destiny was now come, and he braced every energy of mind and body to meet, and, if possible, to control it. The captains exchanged hasty glances one with another, and awaited the issue in silence. Zeno was the first to speak.

"It is not the wont of Sir Roberto di Recanati," said he in a cold and pointed manner, "to be the last to attend when summoned by his general. Your presence is most necessary, and we have waited for you. Be seated."

Zeno motioned to a seat which had been reserved at the side of the table on the right hand, and close to where he sat himself. Recanati took the place, as he replied,

"If I am somewhat late, the shortness of the notice must plead my excuse. I did but put myself in order to attend."

"And yet, methinks, briefer time might have sufficed, Sir Roberto, seeing that my messenger found you still up and in armour. But to the business in hand. I have been advertising these brave and loyal men of a secret conspiracy which is carried on even within the camp, and they have demanded that I should expose to them both the treason and the treachery. I have promised to do so, and but awaited your presence for that purpose."

Whatever might have been the feelings of the condottiere at this ominous opening, he had the skill to conceal them.

"As I am here," said he, "I presume your excellency will proceed. You are, of course, prepared to submit convincing *proofs* to myself and my brothers in arms. Men act not, in such cases, upon mere suspicions."

The wily soldier laid a strong emphasis on the word *proofs*. Despite of his fears, he could not conceive that Zeno had any evidence to adduce against him, however strong suspicion might exist.

"*Proofs!*" retorted Zeno, with a stern voice and kindling eye. "Proofs shall this meeting undoubtedly have, and that soon. Bring hither the Genoese spy."

In a moment the man who had been captured by Sir William Cheke and his trusty Hodge was led into the room, bound and guarded.

"Fellow," said Zeno, "answer me and these honourable Signori truly, as you shall hope to save your life."

"So please your excellency, I will," answered the Genoese.

"Whence came you here?"

"From Chioggia, eccellenza."

"When, and for what purpose?"

"I left the town last night, bearing a secret despatch from those in authority there."

"Dost thou know its contents?"

"I do not: it was tied and sealed."

"What were thy instructions with regard to it?"

"To deliver it with all despatch and privacy to Sir Roberto di Recanati!"

"The eyes of all were turned with wondering inquiry on the accused. Recanati raised his head, and returned their glances with haughty composure. He had weighed and scrutinised

each answer of the Genoese; he felt sure he had never seen him; that he had received the packet safely from, as he believed, the real messenger, and his rapid mind came to the conviction that whoever this witness might be, actual proof against himself could not be adduced.

"It is false!" cried he, in a tone of indignation. "Brothers in arms, I denounce this as a base plot against the reputation of a condottiere, which touches the honour of every soldier of fortune. On the honour of a knight and the faith of a Christian, I swear that I never, till this night, beheld the man who now testifies. Where is this despatch? Let him produce it. Wilt thou dare to affirm, wretch, that thou hast ever seen me till this minute?"

"It is true that I never saw you before, signore. I cannot produce the document."

A smile stole over the face of the soldier, he began to breathe more freely.

"We shall clear up all this presently," said Zeno. "Let the English bowman stand forth."

Hodge at once stepped forward, and stood bolt upright beside the Genoese.

"Good fellow, dost know the man next thee?"

"Ay, so please you, signore: we made acquaintance over night. We found him like a wolf in our preserves, and so we snared him, as your excellency knows."

"Look at this packet. Hast seen it before?"

And Zeno took from the papers before him one which he held towards the archer.

"Assuredly, signore. It is the same which we found upon yonder fellow, when we were going to skin him," said the woodsman, his blue eye laughing at the recollection of the scene; "and which I disposed of as your excellency directed. The Signor Capitano," he continued, turning to Recanati, "will doubtless testify for me that I delivered it to him carefully."

"Brother soldiers," said Zeno, rising and opening the packet, "here in your presence do I stand up and accuse Roberto di Recanati, as a dishonoured knight and a base traitor. I charge him, upon the evidence of these men and the proofs in my hand, of having entered into a treasonable compact with the Genoese at Chioggia."

Recanati sprang to his feet, in a transport of uncontrollable rage. All his composure had deserted him. Hurriedly he placed his hand upon his sword-hilt, and as he half drew it from the scabbard, he exclaimed, in a loud voice of defiance and scorn,

"I fling back thy foul words in thy face, Carlo Zeno. Traitor and dishonoured thyself! Thou false priest, who hast broken thy vows; thou disgraced gambler, and desperate adventurer. Thou liest in thy throat, and I will prove thee a liar with my body. Brother soldiers, I demand at your hands the rights of a knight and a gentleman. There is my gage—I claim the ordeal of battle."

He flung his iron gauntlet heavily upon the table, and was about to spring from the place where he stood, when either arm was seized by two mailed hands, that seemed to grip him as in a vice, and he found himself in the power of two English archers, whose ponderous frames towered over him, and seemed ready at a moment to crush the slender form of the Italian. Silently yet irresistibly they pressed him downwards till he was again seated, pale with fury, but unable to stir. Zeno looked at him with a smile of quiet contempt.

"Signori," he continued, "we shall proceed with our proofs. When they are all laid before you, if you do not pronounce that I have made good my words, I pledge myself that Carlo Zeno, though generalissimo of the forces of the republic, will not refuse the gage that has been flung down to him."

Zeno then proceeded calmly to read the document.

It stipulated that the leaders of the Genoese were willing to secure to Roberto di Recanati a certain stipulated sum of money, to be paid to him upon the termination of the blockade, provided he would undertake to assist them in the following plot, the terms and feasibility of which, it appeared, had been previously fully discussed between them. Upon the night therein named—being the present one—as soon as it was ascertained that the Venetian troops had all retired to rest, and the camp was quiet, emissaries were to be sent by Recanati to the quarters of the other mercenaries who were found to be favourably inclined to aid in the movement, to prepare them for a rising. That signals by means of lights were then to be exchanged between the Genoese and Recanati, upon which a tumult was to be suddenly excited throughout the camp. That upon Zeno's issuing forth from his quarters, two assassins, who were to lie in wait for the purpose, were to rush upon and slay him. Then, amid the confusion and darkness, the Genoese were to sally forth from Chioggia, and making their way to the Venetian camp, were to fall upon the troops, dismayed and in disorder at the death of the general, and, joined by the conspirators at Palestrina, to effect a general slaughter. If this scheme succeeded, the Genoese felt confident that they would be able to effect a communication with the Genoese admiral in the morning, and thus escape the horrors to which they had been so long subjected. Chioggia was, in return, to be left to the conspirators to enter, and to possess themselves of such treasure as the Genoese should be unable to carry away with them.

This instrument was signed by certain parties on behalf of the Genoese, and also by Roberto di Recanati.

"And now, signori," said the general, when he had finished the reading of the document, "how say ye all? Have I proved the existence of the treason as I pledged myself to do? Have I shown you the traitor?"

A general burst of indignation was the instant reply to Zeno's question—

"You have, you have. Down with the traitor. We will stand by our general and the republic."

"The danger is imminent," cried one of the captains; "while we sit here, the enemy may be preparing to assail us; it behoves us at once to take measures for our own safety and that of the state."

"Content you, gentlemen, on that score," answered Zeno. "I have already taken such precautions as I deemed needful. In the first place, I have secured the emissaries who had gone forth an hour since to rouse the conspirators. No signal has been given in the camp, and the Genoese will scarcely venture to leave Chioggia till they see the light. Meantime, how are we to deal with this true knight and loyal ally?"

"He is a traitor and deserves a traitor's death," cried Sir William Cheke.

"He does—he does—away with him to prison," responded every voice.

"Be it so," said Zeno. "I will answer to the republic in this matter. Guards, lead the prisoner to the military dungeon."

But ere the two stout bowmen could execute the order, Recanati had started to his feet, and springing with the nimbleness of a tiger at Zeno, aimed a deadly blow at his head with his sword, shouting loudly, "Recanati, to the rescue!" Well was it for the general that his helmet was wrought by one of the skilfullest armourers of Milan. The blade cleft down upon it, striking fire as steel struck upon steel: the sword was shivered, and the helmet cleft open well-nigh down to the head of the wearer. Zeno staggered beneath the violence of the stroke, and many a hand was raised to fell the traitor to the earth. But the general quickly recovered, and interposed with all the weight of his authority.

"Nay, my good friends, nay; ye shall not stain your true blades with the foul blood of such a one as this. We shall reserve him for a more fitting punishment than death from the swords of true soldiers."

The guards had now succeeded in restraining Recanati, and were hurrying him away, when the noise of feet and the shout of many voices were heard without. Cheke instantly whispered to Alexis, who left the apartment, and all then arose and stood around the general.

"To the rescue—to the rescue, my brave lancers!" shouted Recanati, "your captain, Recanati, is seized—they are going to slaughter him!"

PENCIL-MAKING AT KESWICK.

SITUATED in a slightly undulating valley, with the lake of glorious Derwentwater in the immediate vicinity, backed by Skiddaw, who rears his hoary peaks to an elevation of more than three thousand feet, and traversed by the river Greta, endeared to every lover of the English language by its literary associations, is the pretty straggling town of Keswick. Were this spot "unknown to fame," from the irresistible attractions which its neighbourhood presents to all lovers of the sublime and beautiful, there would be an interest felt in the spot by at least some sections of the community, as having furnished them with the means of embodying their own conceptions of taste and fancy by the pencil of the artist. And it is to Keswick in this respect that we have now to invite the attention of our reader.

The pencil-works of Messrs. Banks, Son, and Co., which we have to visit, are seated on the banks of the Greta, the waters of which furnish the motive power for all the machinery of the establishment. The factory itself consists of a house of several stories, in the premises connected with which the cedar

FIG. 1.—CUTTING AND GROOVING PENCILS.

logs are stored, after their voyage from South America, for the service of the works; amounting in the course of a year to no less than from five thousand to six thousand cubic feet, and serving for the manufacture of some five or six millions of cedar pencils.

The first process in their formation is the cutting up of the logs into various sizes, according to the lengths and kinds of pencils to be made. On entering the workshop in which this is carried on, the senses are variously affected by the different objects that present themselves. The eye is confused by the machinery in action, and the bands and spindles by which motion is given to the several parts; the ear is filled with the hum and *skurr* of the saws; and the nose is irritated by the flood of fine wood-dust which fills the room, and which, though at first not unpleasant, before long occasions annoyance, and even nausea to one unaccustomed to it.

At the end of this room the methods may be witnessed by which the cutting up of the logs of cedar into proper lengths is effected by means of a circular saw, the pieces being afterwards reduced to thin planks by another instrument. A man then takes one of the thin planks, which has already been prepared, and is of the length of three or four pencils, and wide enough, perhaps, for a dozen, and, by means of a machine, of which we furnish an illustration (fig. 1), he cuts it into thin oblong strips; and, while this is being accomplished, he regulates with his feet the action of another circular saw, placed at right angles to the one first mentioned, which cuts in the wood the grooves for the insertion of the lead. As, however, the lead passes only along a portion of a pencil, the length and position of a groove has to be regulated accordingly. One-half of the pencil having thus been prepared, a smaller oblong piece is also cut, which may fit against the first and complete the whole.

The material employed in the formation of lead-pencils, and which is improperly called black-lead, is a compound of carbon and iron, and is found in various situations, such as among mountains, in beds of quartz, and in masses of calcareous earth, often looking like stones in a bed of gravel. It generally occurs in kidney-shaped pieces, varying in size from

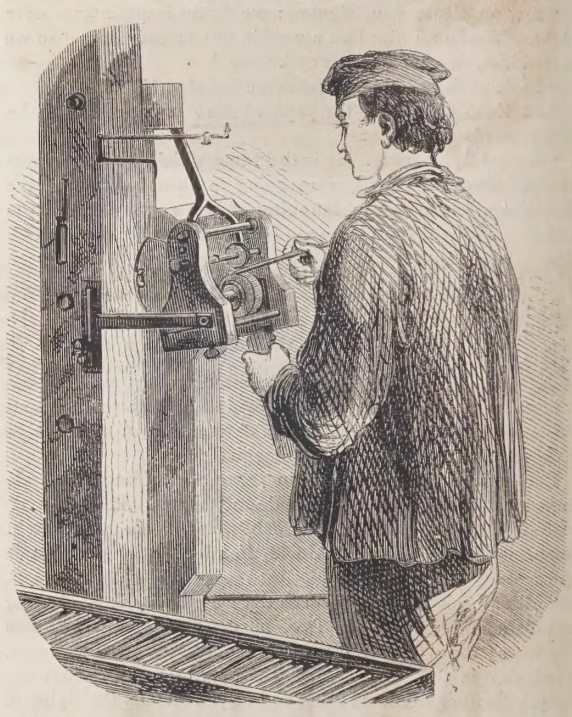

FIG. 2.—LETTERING PENCILS.

that of a pea upwards. The most celebrated black-lead mine, is that in Borrowdale, Cumberland, six miles from Keswick, which was accidentally discovered in the reign of Queen Elizabeth, and proved to be of the purest carbon next to the diamond. When its commercial value was first ascertained, the proprietors found it very difficult to guard the mine from depredations; the practice of robbing it having become at length so common, that persons living in the neighbourhood were said to have made large fortunes by secreting and selling the mineral. About a century ago, a body of miners broke into the mine by main force, and held possession of it for so long a time as to succeed in abstracting from it an enormous quantity of lead, which they sold at so low a price, that the proprietor was induced to buy it up in order to restore the old rate of prices. Some years since the mine failed, and very little or anything has been obtained from it since, though there is Borrowdale lead still in existence. Messrs. Banks, Son, and Co., are part proprietors of the mine, their share at the last and final division of the produce being about five hundred pounds' weight of the lead. When lead was obtained

from the Borrowdale mine, it was sent to London for sale, and being bought by manufacturers at Keswick, it was sent back again, and thus the town maintained its reputation for the production of pencils.

When the lead is of sufficient size, the processes in its preparation are greatly simplified, since all smaller pieces have to be cut up, pounded down, and mixed together. With this

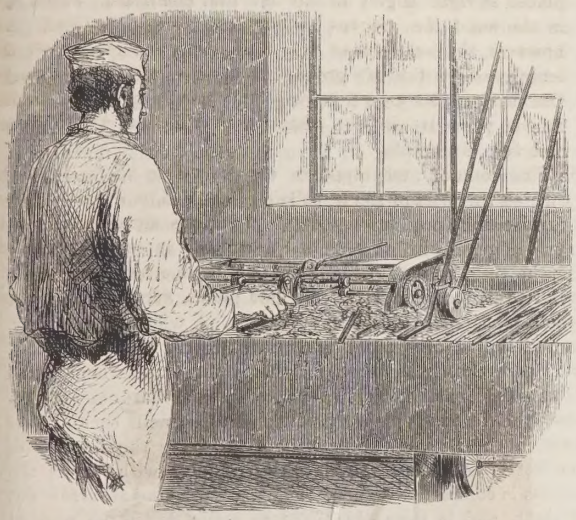

FIG. 3.—ROUNDING PENCILS.

a large quantity is mingled which is obtained from other countries, and as little of the larger sort remains, artists now find that pencils are very inferior in quality to what they once were, and that though they may be stamped with the words "Warranted pure Cumberland lead," they often have little or none of it in them.

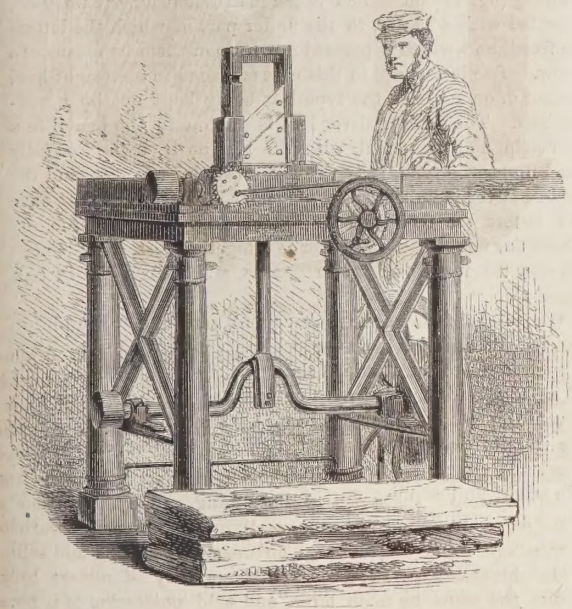

FIG. 5.—MACHINE FOR CUTTING THE ENDS OF PENCILS.

The inferior qualities of lead are intermingled with grit and particles of sand, which have to be removed. For this purpose the material is crushed between iron rollers, sifted, cleansed, ground, heated in close retorts, and compressed into oblong slabs; these operations being carried on in another part of the establishment. In the case of the pure Borrowdale lead, these processes are omitted, the only preliminary step that is required being to remove the foreign ingredients from the exterior.

The wood having been thus far prepared, it is given to a sorter, who selects from it those pieces which have knobs and irregular parts; these are put aside for fire-wood. On seeing the heaps of wood thus regarded as useless, we suggested that it might have been preserved for the formation of cedar

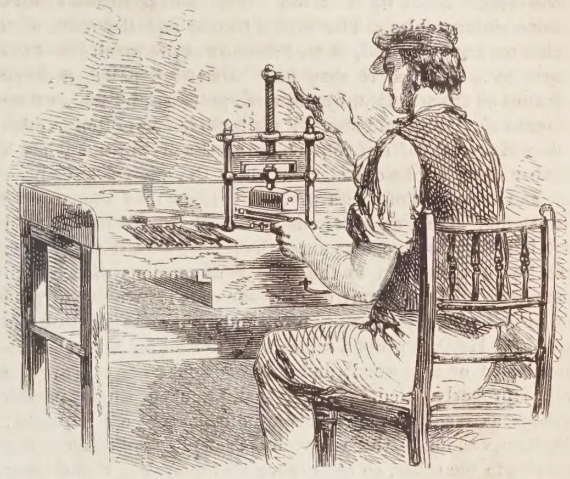

FIG. 4.—GILDING PENCILS.

matches; but according to present usage a great deal of good material is sold as firewood to the women of the neighbourhood. The cedars which have been prepared are now sent up stairs to be "set out," as it is called, and are then marked so as to guide the men in the insertion of the lead in the grooves as to where the pencil shall end.

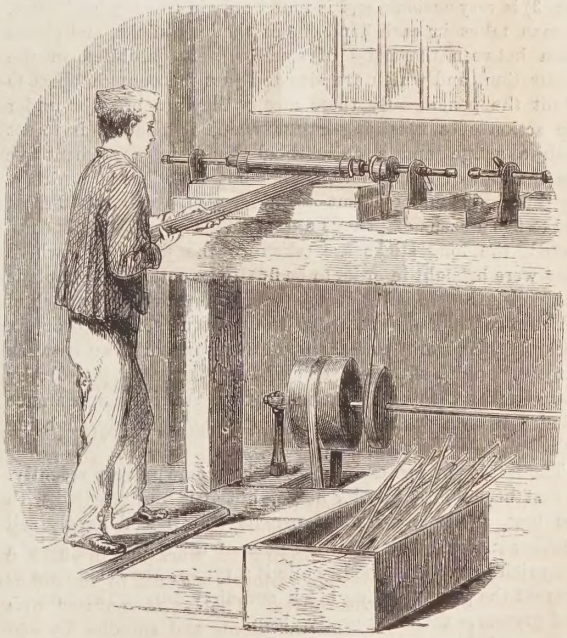

FIG. 6.—POLISHING PENCILS.

When the lumps of lead are taken from the cask, they are glued to a board, in order to secure them in a position in which they may be sawed into thin slices or scantlings, care being taken in this process to occasion as little waste as possible. Judgment has now to be exercised in the selection of leads of the right degrees of hardness, so that when they are made up it may not be found that a pencil is an H H at one end and a

B B at the other. For the hardest pencils the lead is prepared chemically, and for the softest an increased thickness of lead is inserted. The dust and scraps are preserved for the formation of inferior qualities of goods.

We next visit the benches at which the lead is fitted into the grooves in the strips of cedar. The men here at work present a peculiar appearance. They are dressed in dark blue smocks,—this being the general costume of the place,—with loose sleeves fitted tight at the wrist, and are sitting at very black shining tables. The men's hands, and the tools with which they are engaged, as well as most of the furniture of the apartment, look as if they had been fresh polished every morning by the servants, by the same processes by which they cleansed the grates and stoves; while their faces often exhibit tints and streaks of different colours. Each workman has a number of the sticks of cedar, in which the grooves have been cut, and a number of slices of lead just as they appear after the sawing. He then takes one of the slices, and having seen that it is not too broad to enter the groove—for if this be the case he rubs it down to the proper dimensions on a rough stone which lies in front of him—he dips it in a pot of glue which is kept hot just beside him, and then presses it into the grooves. He then gives a scratch to the lead on a level with the surface of the wood, and breaks it off, so as to leave the groove properly filled. In the making of a single pencil, perhaps as many as three or four slice lengths are required; but however many there may be, each slice is fitted exactly endwise to the other, so as to leave no intervals. Should any of the lead afterwards project above the groove in the cedar, it is scraped off with a knife; this is called *shutting*. The rods being thus filled, are conveyed to the fastener-up. This operation is carried on with surprising dexterity. The workman glues the cedar-covers or slips over the filled rods, and having got a certain number arranged alongside of each other, he fixes them tightly together, and lays them aside to dry.

The pencil now presents the appearance of an oblong cedar stick, very rough and long, and it is removed down stairs to be rounded. The machine by which this is accomplished (fig. 3) is very curious, and is found only in this establishment. A man takes in each hand one of the long sticks, and places them between the pairs of small wheels exhibited in the illustration, and which are situated just far enough apart to admit the pencil. By these means they are brought under the action of a revolving cutter, which is made so as to act with a gauge and a chisel blade, and in a moment we see the end of the pencil passing out rounded to a nicety. By this simple and efficient machine, a man will round from 600 to 800 dozens of pencils a day. This process being completed, the long sticks are taken to the floor from which they were brought in order to be finally smoothed with a plane and polished. To effect this, benches are provided, at each of which two boys are at work, who take up some five or six sticks in their hands, and then pull them up and down between a roller covered with leather and a leather board (fig. 6); by these means the pencils are made to present the appearance of nice smooth walking-sticks, some thousand dozen being polished a day by each boy.

The fashion of varnishing pencils has come up very recently. It first began with inferior kinds, but it is now adopted with the best, and many sorts of pencils will indeed hardly sell without it. It brings out the colour of the cedar, and gives a deep rich hue to the wood, while it serves at the same time to prevent the pencil getting black and dirty during the cutting, and preserves them uniformly clean.

The polishing being completed, the next step is to cut the rods into lengths. This is accomplished by the aid of a circular saw, which insinuates itself through an aperture in a table, and against which a boy presses a row of pencils, the proper length being determined by a gauge. This cross-cutting, however, is not sufficient to complete them with a proper degree of nicety, and to finish them they are handed to another workman. In front of him is a bench, from out of which projects a little bit of wood, on the top of which is a piece of iron having holes to fit different sizes of pencils, and then with a razor-blade fixed in a wooden handle, he cuts the top off so as to leave a perfectly smooth edge. The wood ends are finished on a more wholesale principle, by the aid of what may be called a guillotine, of which we furnish an illustration (fig. 5). This instrument is used only by Messrs. Banks and Son, and consists of four iron pillars supporting an iron table, at the top of which is a blade fixed diagonally; this being set in motion by a crank at the lower part of the machine, moves up and down. All that the boy who attends its operation has to do, is to put five or six pencils under the grooves made for them, and down comes the blade, so that the heads are nicely finished without further trouble. A hundred dozen may easily be cut by this guillotine in a day.

The last operation in the history of the manufacture of a pencil is the stamping on them the name of the maker, and the indication of their quality. Of the ingenious instrument by which this part of the work is accomplished, an illustration is furnished by our artist (fig. 2). The workman holds a dozen or two of pencils in his left hand, and then, taking them one by one, he puts an end of each on to a grooved wheel which is rapidly revolving, and by the movements of this wheel the pencil is carried onward. Above this wheel is another, around which are raised types forming the words "Banks, Son, and Co., Manufacturers, Keswick, Cumberland," and also the letters significant of their degree of hardness or softness, the latter being moveable. The pencil cannot pass between these two wheels without receiving the impress of the letters in the cedar; and the rapidity with which the process is completed is such, that it passes like an arrow out of sight, and is instantly heard to rattle down the wooden tube prepared for its reception on the other side into a box below. Some idea may be formed of the ease and expedition with which this is accomplished, from the fact, that from 120 to 200 pencils may be lettered in a minute. At the lower part of the machine is the box in which the pencils are kept which are about to undergo the process.

Many pencils are now finished, but some have gilt letters instead of the mere impress on the wood. When this is done, they are taken to a table close by—of which, also, we give a drawing (fig. 4)—on which is the instrument for the purpose, provided with a heater, to the under part of which the letters are fixed, and which is pressed down upon them by means of a screw. The letters are in this case arranged in a straight line, instead of on a wheel, the type-box being kept hot by a red-hot iron. The gold or silver leaf is put on to the pencil in a thin strip, and the pencil, with the leaf on it, being carefully fixed under the type, it is pressed down by a screw, and the gold or silver is imbedded in the cedar. The pencils that have gilt letters are usually coloured black, yellow, or blue, by which the fine tint of the cedar is altogether lost. The pencils are now taken and tied up in dozens, and afterwards in half grosses.

We might follow the subsequent career of a bundle of pencils, and find that it was not without interest. One, perhaps, is transferred to the studio of the artist, another to the boudoir of a lady, and a third may embody the rising genius of a youthful prodigy, who sketches horses with human heads to the infinite delight of his mother, who is assured, as she emphatically expresses it, that he will be "somebody some day." We might philosophise on the permanence which is given to fleeting thoughts of ideal beauty in their representation by the artist, who by its aid secures to himself and for others what would otherwise be but the evanescent conceptions of the hour. And we might conclude by moralising on the fact, that as it is by the wear and tear and destruction of the agent that its worth is developed, so it often is that men, in striving and labouring for society and the world, are themselves exhausted and consumed, and the elements of their physical constitution pass away, to mingle with, and to be absorbed into, the universe at large. But we leave these considerations to the meditation of our readers, as may suit their individual taste and feeling; our work being discharged in having, we hope, thrown some light on the history of the rise, progress, and decay of a cedar pencil.

EPISODE IN THE LIFE OF THE DUKE OF WELLINGTON.

Amongst many anecdotes told of the "Duke," in the multitudinous biographies published after his death, there is one which we do not recollect having seen, and which is certainly far more worthy of notice than many of them. The sum and substance of it is, that he, on one occasion, towards the close of the Peninsular war, had an extraordinary narrow escape from being seized by the French, and carried off bodily to the camp of Marshal Soult. This would, certainly, have brought the campaign to a very ignoble end, and though it would not have saved Napoleon from downfall, would have prevented the battle of Toulouse, and thus saved the lives of many gallant men for the time. What might have been the ultimate effects of such a catastrophe upon the lives and liberties of the inhabitants of Europe, it is impossible now to say with any certainty, and useless to conjecture. But to our story:

We all know, that after the great and crowning victory of Vittoria, the British army marched straight to the frontiers of France, but—to do the French justice—not without finding every inch of the route vigorously contested. In January, 1814, the boundary was crossed, and the invaders encamped close to Bayonne, and threatened the town. The main body of the army was posted in the village of Anglet, the outposts lay on the left bank of the Adour, while the French under Marshal Soult occupied the right. The Duke of Wellington fixed his head-quarters in a pretty cottage, crowning one of the wooded hills which overhang Anglet, and from which the view took in Bayonne, the Atlantic, and the great road from Spain. The cottage was called Salha, and was but a short distance from the bay of Blanc Pignon, in which the Adour widens out, as if to gain strength for its final plunge into the ocean. In the middle of this bay, for the protection of the port, there were moored at that time a small armed vessel, called "La Mouche," and several gun-boats, the whole under the command of a lieutenant of the French navy, named Bourgeois, who was burning with a desire to distinguish himself, as might be expected of a naval officer whom the English cruisers had kept from showing his nose out of the harbour for many years; for since the battle of Trafalgar the French were not favoured at sea, nor intended to have dominion over it. This individual was a native of the village of Anglet, and his relatives still lived there, and he was consequently daily put in possession of all the movements which took place in the English camp. A message was brought him, that on a certain day named, the Duke of Wellington was about to reconnoitre the enemy's position on the right bank of the Adour. His informants even went so far as to mention the precise time, the exact point of the river, and the number of officers who would accompany him. Upon hearing this, Bourgeois resolved to attempt a surprise. There were pine woods upon the sandy flats on the left of the Adour, completely cutting off the view of the river from the plain at Anglet, and admirably adapted for an ambuscade to be directed against any one who approached the river from the south. A small body of men concealed in the wood, might, in the opinion of Bourgeois, in case the Duke came without escort, carry him off without being perceived till it would be too late to think of rendering assistance.

However, he did not like to take upon himself the responsibility of such an act without consulting his superior officer, who was stationed at Bayonne. He therefore wrote to him, telling him the information he had received, and asking his permission to attempt a *coup-de-main*. He sent his letter by a sailor on the morning of the 22nd of January, with orders to wait for an answer. The Duke was expected to arrive at noon, so that no time was to be lost. During the absence of his messenger, Bourgeois selected twelve of the best men of his crew, armed them to the teeth, and placed them in the boat, ready to start at a moment's notice. He now began to be very fidgetty, and several times made reference to the "name of thunder," a "thousand devils," a "plague," and the "vestry-room of a church," or else "the church plate;"—which of them he contemplated, we cannot take upon us to say; and his dissatisfaction reached a climax, when his messenger returned, bringing word from his chief (every man in France has a chief), that his proposal would be taken into consideration. M. Bourgeois considered this rather cool, and not a little provoking, particularly as he had the mortification of witnessing six English officers, on the afternoon of the 22nd, ride slowly along the river, and make their observations at their leisure. The opportunity was lost, and M. Bourgeois took the affair so much to heart, that he had no sleep for the next two nights, and ate but little during the day, and he did not know whether to laugh or cry, when on the 22nd the "chief" wrote to him officially as follows:—

"Monsieur,

"I have communicated your letter to the governor [of Bayonne], and he has replied, that there is no occasion to make any expedition on the left bank of the Adour; but if the enemy should come within range of your guns, you are at liberty to fire upon him."

Considering how unlikely it was that the enemy would ever be such fools as to do anything of the kind, M. Bourgeois did not find much consolation for his disappointment in this permission.

However, he brightened up a little when, just after receiving this letter, a messenger arrived from Anglet with the intelligence that the Duke was about to pay another reconnoitering visit on that very day and in the same place. This time Bourgeois resolved to act upon his own responsibility, and sent word to the chief merely that he was gone to make some soundings in the harbour, and that he had armed his boat's crew for the purpose of guarding against accidents, considering the near vicinity of the enemy's outposts. He took with him twelve picked men, and rowed leisurely down the middle of the river as if he was merely following the current; but as soon as he got into the shelter of the trees, and was hidden from the view of the sentinels on the heights, he suddenly pushed towards the bank and landed. The party made their way through the pine wood, until they arrived at the foot of Blanc Pignon, where they posted themselves in a thicket on both sides of the road along which the Duke would have to pass.

Having stationed his men, Bourgeois went to the top of an eminence at the extremity of the downs, where he posted himself, with a look-out man, in a position whence he could see the English quarters, and the road which led from them, without being seen himself, at least by the enemy. It was not very long before he heard the bugle sounding in the British camp, and saw the troops turning out and falling into their ranks upon the level ground on the heights of Salha. They then passed in review before Wellington, and M. Bourgeois had full opportunity to contemplate their discipline, dexterity, and martial air. Just at this moment he chanced to glance towards the town of Bayonne, and was surprised to see four men on the tower of the cathedral watching either him or the English intently—he knew not which. This rather alarmed him, but his spirits rose on seeing the Duke and six officers on horseback, as soon as the review was over, take a direct road towards the wood. In a few minutes they were within five hundred yards of the ambuscade. Bourgeois took up a stone and flung it amongst his men as a warning to be ready, and waited the result in dread suspense, his hand upon his sword, ready for a rush. At that moment a signal was given from the cathedral tower, and a cavalier darted out from the French advance guard at full gallop, and took his post at the entrance to the wood. This movement aroused the attention of the English; they stopped and deliberated together as to what course they should take. The lookers-out on the cathedral disappeared. M. Bourgeois hastened to the entrance of the wood and assembled his men; but Wellington had already turned his horse's head, and was far on his way to Salha. The chagrin of poor Bourgeois at this frustration of his magnanimous project may be easily imagined.

THE FORTRESS OF LUCCA.

THE ancient kingdom of Granada is one of the most mountainous and picturesque regions in all Spain. Green, beautiful valleys, lofty hills denuded of verdure, whose summits seem to reach the clouds, a sky intensely blue, castles built in Moorish days on craggy heights like eagles'-nests—all combine to make this country the most magnificent and attractive in the whole extent of Spanish territory. In some parts the rocks present the appearance of an immense amphitheatre, in others that of a gigantic staircase—mountains piled on mountains, with a winding road amid their threatening defiles, a road which here and there dwindles away into a narrow mule track, edged by a deep abyss, which one needs to pass under the guidance of a skilful muleteer. The fortress of Lucca is situated in the very heart of the mountain district, five miles distant from the old town of Castro. It occupies a high and conspicuous position. Glorious memories are awakened by a glimpse of its dismantled walls—stories of fierce war and tender love—of gallant deeds of arms which put to shame all modern Spanish heroism. There is a strange old legend connected with the castle, which the muleteer is well-nigh certain to relate as soon as he obtains a listener—how once upon a time, when the Moors were in possession of the castle, and the banner of the crescent waved from its summit, Queen Isabella resolved to take the place by storm; how the Arab commander, well knowing the impregnability of his position, laughed in derision as he saw the Christians afar off; how the troops of Isabella became dispirited as they strove in vain to reach the eyrie-citadel; but how, when their ardour was fading away, the holy Virgin herself appeared and led them on; how a road, unknown before, stretched itself out at their approaching footsteps, and made the way clear and accessible to the very gates of the castle; how the Arab leader, when he saw the miracle, mounted his horse and fled, but alas! for him, fell over a precipice, and man and beast were dashed to pieces. In confirmation of the story the muleteer points out the miraculous road, a strange circuitous path that looks like a ribbon carelessly thrown down; draws attention to the strange marks, which may be taken for the impression of a horse's hoofs, on the side of a deep gulf; and leads the traveller to the ruined tower itself, that strange old remnant of the past.

FORTRESS OF LUCCA.

The inhabitants of the mountain district are a hardy peasantry, bold and alert; great lovers of the national dances and national music. The men of the mountains, all over the world, have ever been the most enterprising and the most daring. The spirit of ancient chivalry, the love of country, the fearlessness of danger, which marked the men in the old time, still lingers, in some measure, in its mountain home. The dwellers in these wild districts are said to be the most superstitious in the country; and if ever one locality was more calculated than another to produce such feelings, these mountain passes are the very spots. Old legends belong to every moss-covered ruin, to every height, to every valley; there is not a crumbling tower or a cross by the wayside but has its strange unearthly story.

CHARACTERISTICS OF GERMAN LITERATURE AND ART.

TAKING a comparative glance at the leading families of the human species, it is interesting to notice the many different aspects under which some dominant quality, peculiar to each race, is shadowed forth. In its language and literature, its

THE MOTHER AND CHILD.—ILLUSTRATION OF A POEM BY UHLAND.

rchitecture and fine arts, in the daily routine of peaceful life nd the exceptional condition of war, the careful observer ill find the characteristics of a race displayed.

Who can be more individualised by his peculiarities than the Celt? Seek him where we will—whether in the Basque provinces of Spain, or amidst the bogs of Ireland; whether in the Scotch highlands, or the mountain tracts of Wales—in temperament he is the same, and this temperament is reflected in every phase of his existence. His mental organisation, delicately attuned, is responsive to every external impression. His impulses are generous, his soul is poetic; but the balance of his mental faculties is unstable. He originates ideas with-

out combining them. His mental creations want body, weight, and form. Like spirits, they are invoked; like spirits, they flit away.

Then what a speaking commentary on the Celtic temperament—what an epitome of its fervour, its poesy, its instability, are the small remaining fragments of that people's literature. Fragments we say, for surely one is not called on to acknowledge a few Welsh ballads, and the apocryphal version of Ossian, as the full literary representative of Celtic genius. Not that we undervalue the poems of Ossian, by the way, or deem them altogether spurious. That the materials of these poems existed orally, traditionally, we entertain no doubt.

Scarcely less expressive of the Celt's temperament than his literature is the phase under which we view him in war. Choleric of disposition, quick to take offence, the Celt has from all time been prone to appeal to the sword's arbitrament. None more daring in the field than he—none more personally brave—more dashing and impetuous; yet for want of a prolonged concentration of energy to one object—a want so characteristic of his race—he has never yet excelled in the larger strategy of war. He is a creature of raids, forays, and skirmishes—brilliant onslaughts and fierce attacks. But he is no general—he cannot *handle* large bodies of men. The battle-field is no chess-board for him; he must rush to the fray.

We might easily extend the number of our instances, and demonstrate the outshining of Celtic genius under many other phases, though still essentially the same; time and space, however, admonish us to pass on and scrutinise another dominant race, which more particularly concerns us now; that race the Celt's antipodes—we mean the *Teutonic*, of course. And here one preliminary word; it is this: we beg to eschew all that delicate ethnological investigation which affects to settle relationship between Teuton and Goth. By Teutonic we mean the German race, and by the German race we mean all those who speak the German tongue. The demarcation suffices; nay, it is even more correct than it seems. None but a mind of true Teutonic mould can think with fluency in the German language.

Who can doubt the expressiveness of that language and its literature? Nay, who can misinterpret the expression of the German alphabet itself? Why, it is the very epitome of the Gothic style of architecture, and both are the representatives of the German mind—massive, yet detailed; fanciful, yet rigid—ponderous, sombre, and deeply toned. What more simple than the first idea of a Gothic architectural structure? What more elaborately made out than the ornamentation of its details? Starting with the one simple idea of an arch, the builder at length overlays his structure with the most florid accessories. So wayward, so fanciful, so ramified are these, that the mind of an observer is for a time lost in following them through their maze. Yet when the labyrinth has been threaded—when the fret-work has been seen in its minutiæ—all is found to bear the impress of proportion and form defined. Fanciful and wayward though the architect has been, he has never once lost sight of the leading Teutonic idea—of uniting the ideal to the material, fixing it, rendering it visible and tangible, by endowing it with form. Even a German ghost is more bodily than any other ghost; half endowed with substance and proportions. Once caught, the spectre comes from the German's hands half a thing of earth.

There is a charm about German literature and painting which, if we mistake not, is explicable on the principles announced as constituting the peculiarity of the Teutonic mind—that is to say, is attributable to a contrast between the simplicity of a first idea and the elaborate form-wrought accessories wherewith it is subsequently invested. This we believe to be a peculiarity of the Teutonic genius—a peculiarity manifested under thousands of phases, and not least of all in the literature of Germany. So essentially Teutonic, so Germanesque is this literary exponent of a principle, that it admits of no good translation. An integral portion of that language, it can be wedded to no other; and as some tender plants assume rank growths and ungainly mien when taken from their native soil and planted elsewhere—so it is with many exquisite scions of German poetry and prose. Integral parts of their own language, they flourish in no other. They may not die, but their elegance departs. Thousands of little tales and poems, which breathe the most exquisite sentiment in German, become, when rendered in a foreign tongue, only little better than a sort of nursery literature of the higher class. The wood-cut (p. 257) to which our remarks apply illustrates, and was suggested by, a stanza of this kind.

The mother, fondly caressing her little child, is asked by the latter where her brother has gone. The mother tells the little child her brother has died. But the little child knows not of death. "The angels have taken him away," continues the mother, "because he was always so good to me, and never gave me trouble." The little child then says, "Pray teach me how I may *not* be good, and how I may torment you, lest the angels also take me." This is the sentiment—this the inspiring theme of some exquisite stanzas by Johann Ludwig Uhland, a celebrated living poet of Germany, and whose beautiful lyrics are not half so well known as they deserve to be. Uhland may be characterised as a German Beranger, purified from all that levity of things sacred which too often sullies the French bard's effusions. Every thought, every aspiration of Uhland, is suggestive of that better existence to which the minds of rational beings should be directed. No poet has realised a more exalted conception of the nobleness of his mission than Uhland. Few authors of poetry worth reading have written so sparingly; nor is this to be wondered at, seeing the peculiar circumstances under which he has been placed—the troublous mould in which his destinies have been cast.

Born in 1787, at Tübingen, the son of the university secretary, Uhland early manifested his love for literary pursuits, although he trained himself for the law. Blessed with a competent fortune, our author would have devoted himself entirely to literature and the muses. But fate willed it otherwise. The great French Revolution broke forth, and involved Wurtemburg in its ramifications. The organic laws and constitution of this little country were totally remodelled at the will of Napoleon. Uhland did not behold these changes quietly or complacently. They aroused his spirit, and inspired some of his happiest effusions. Nevertheless, the poems of Uhland are well esteemed in France: not so much in consequence of their poetic merit, it may be (for our Gallic friends are often unjust to the Teutonic muse), as from the circumstance of their author having lived several years in Paris, where he devoted himself with the zeal of a true enthusiast to the study of mediæval literature, in which department the libraries of Paris are peculiarly rich.

Much of Uhland's poetry could never be adequately rendered into English. The task has been essayed by an Englishman whom we forbear to name, and the result is not felicitous. Yet we do not censure the translator: he had to deal with a poet who availed himself to the fullest extent of the power existing in the German language of endowing common subjects with a poetic garb. What shall we say, for example, of the poet who was so recklessly daring, that he wrote some stanzas—beautiful stanzas, too, on—what does the reader think?—*Pork soup!* Yet so it is.

We congratulate the French artist, whose painting we illustrate, on having so thoroughly caught the inspiration of Teutonic art. The figures are well composed—their modelling is round—the expression of the mother and child tells the sentiment of the poem. The leaves in the back ground, too, are thoroughly Germanesque. Not a leaf is left undefined out of deference to that quality of Teutonic genius which insists on extreme regard to form. Nor need we marvel that the genius of a people who invest spirits with bodies half mortal, causing them to marry, and to be given in marriage, to become almost like ourselves, will insist on making fig leaves more distinct of outline than nature herself makes them under the conditions of position and distance, as represented in our wood-cut. The painting is thoroughly Germanesque an expression of ours, which we intend as a compliment to the French artist.

AIR BALLOONS.

The accompanying engraving is a specimen of the numerous caricatures which were brought forth by the invention of air balloons, like so many insects fluttering in a sunbeam.

The satirical drawing of the *Volomanist* was most probably aimed at Faujas de Saint-Fond, a young geologist, the friend and *protégé* of Buffon, whose gigantic theories, his observations on the formation of the earth, and his researches respecting extinct volcanoes, he supported. When an official report, signed by the deputies of the state of Vivarais, together with various private letters, arrived to inform the Parisians and the members of the Academy, for the most part men who did not easily imbibe new ideas, that two young manufacturers had launched into the air, at Annonay, a globe of considerable size, which sustained itself and sailed through space, there was a general burst of enthusiasm before envious feelings had had time to display themselves. M. Faujas was among the most ardent admirers of the new discovery, and in order that the experiment might be repeated at Paris, instituted a national subscription, to which the people entered their names at the Café du Caveau, now the Rotonde.

Etienne Mongolfier gave an account of his ascent at Annonay, which was expressed with a moderation seldom met with in that age of exaggeration and hyperbole. The scrupulous exactness of the details which it contained enabled M. Charles, professor of experimental philosophy, and the Messrs. Robert, skilful machine-makers, to satisfy, in the space of a month, the expectations of the subscribers, and to dispense with the presence of the inventors whilst making use of their discovery. However, one of the Messrs. Mongolfier arrived in Paris in time to see that he had enabled his fellow-townspeople to make the experiment without his help.

The words in which he describes his ascent, and the means which he employed to effect it, are very striking, from their extreme simplicity and clearness. He says :—

"The aerostatic machine (p. 261)* with which the experiment was made before the gentlemen of the state of Vivarais, on Thursday, 5th June, 1783, was made of linen, lined with paper, sewn to a network of twine. Its form was nearly spherical, and its circumference measured 110 feet; a wooden frame, 16 feet square, held it fast at the bottom. Its capacity was about 22,000 cubic feet, so that it displaced, supposing the weight of air to be an 800th part of that of water, a mass of air weighing 1,980lbs.

"The weight of the gas was half that of air, for it weighed 990lbs., and the machine, with the frame, weighed 500lbs. Therefore, it was still 490lbs. lighter than common air, which has been proved by the experiment. The different pieces of the machine were fastened together by means of simple buttons and button-holes. Two men were sufficient to set it off, and to fill it with the gas; but eight persons were required for the purpose of holding it down, who did not release their hold until the signal was given. It rose with great velocity, its motion becoming less rapid towards the end of the ascent, to about the height of 6,300 feet. A breeze, scarcely perceptible upon the surface of the earth, carried it a distance of 76,000 feet from the place from which it had started. It remained ten minutes in the air; the loss of gas through the button and the holes made by the needle, and other imperfections in the machine, causing it to descend sooner than it would otherwise have done. The wind, at the time of the experiment, was in the south, and it rained. The machine descended so lightly, that it broke neither the stem nor the props of the vine upon which it alighted."

This account is quoted in the work of M. Faujas, upon the experiment of the Champs de Mars, where a globe, twelve feet in diameter, made of taffeta coated with india-rubber, was inflated and launched into the air, on the 27th of August, 1783, by means of the constant labour of many workmen for the space of four days, and by employing 1,000lbs. of steel filings, and 498lbs. of sulphuric acid. M. Charles, and the Messrs. Robert, who worked under the direction of the above experimental philosopher, filled their balloon with hydrogen gas, the use of which the brothers Mongolfier had abandoned since their first experiment, because they found the expense of it too great.

Admission to the Champs de Mars, where the public were diverting themselves with his discovery, was refused to Etienne Mongolfier; he gave his name, and being repulsed, quietly retired. Faujas considered himself personally insulted by this conduct towards one of the inventors, whose genius he so much admired, and in honour of whom he had set the subscription on foot; displeased, moreover, with the Roberts, who had filled the balloon in such a manner as to cause it to explode, he complained loudly, and a virulent paper warfare was soon declared between the subscribers—M. Faujas at the head—and the philosophers and machine-makers employed by them. The caricature of the *Volomanist* was doubtless connected with this contest. Grimm, who relates in detail the literary and scientific events of the time, mentions this conflict more than once in his correspondence.

"We have had the honour of giving you an account," writes he, "of the pretensions of M. Charles, the experimental philosopher, to the discovery of M. Mongolfier. Whilst the latter was occupied in perfecting his machine, ascending to the height of more than 300 feet in the air, M. Charles sought out pamphleteers, and, in his circumstances, could only find the Chevalier de Rivarol. This writer interested himself less in maintaining the pretensions of his client than in seeking to lessen, as much as possible, the fame of M. Mongolfier, and to bring into ridicule M. Faujas de Saint-Fond, who was zealously engaged in forwarding the principles and repeating the experiments of the Messrs. Mongolfier, by raising a subscription, and having a medal struck in their honour."

Now the question was, who should derive profit or glory from the discovery made by the two quiet, retiring philosophers. What then took place recalls the allegory of the East, where a young prince, by dint of labour, perseverance, courage, and intelligence, succeeds in reaching the precious nut which grows on the highest branch of the tree of science. He opens it: all sorts of wonders burst from it; but those who, not daring or not being able to climb, have stopped at the foot of the tree, dart in crowds upon this booty, possess themselves of it, and the two empty shells of the mysterious and fruitful nut are all that remain in the hands of the true and courageous victor.

From that time innumerable pamphlets announced experiments which had only been projected. Tradesmen enriched themselves by selling little balloons, made of gold-beaters' skin, or varnished taffeta. Some printed their hypotheses, and pretended means of guidance; others, like Blanchard, had engravings executed of balloons, which were not always even constructed.

Thus the balloon of Dr. Jonathan, with the explanations which accompany it, probably only existed upon paper. The cannon represented in front of the gondola was never discharged, either to announce the arrival or the departure of an aeronaut, and never accelerated the course of a balloon, for none was ever made fit to cleave the air. The only trace which we find of the experiment of Dr. Jonathan is the notice of the ascent of a simple fire-balloon on the 24th of December, 1783, which quickly disappeared.

The aerostatic fish*, represented in our engraving (p. 261),

* The first experiment of the aerostatic machine, with the means of directing it at will, by Dr. Jonathan, took place at the village of Dessessebrugue, in France, whence this machine ascended, December 22nd, 1783, at nine o'clock in the morning. It descended at the place whence it had risen, after having traversed ten miles. This machine was constructed of very fine brass wire, covered with a sheet of cotton, coated with cement. The rudder was of the same material, and the sail of common canvas.

* The aerostatic fish was set off at Plazentia, a town of Spain, surrounded by mountains. It was guided by Don Joseph Patinha as far as the town of Coria, on the banks of the river Aragon, at twelve miles' distance from Plazentia, March 10th, 1784.

appears to be a burlesque on the balloon, in the shape of a fish, which ascended on the 19th of September, 1784, in Spain, guided, it is said, by Don Joseph Patinha, and which was impelled by a favourable breeze.

Indeed, it would be difficult to conceive any form for balloons which the first inventors had not taken into consideration. That of a fish, among others, was foremost in the minds of the two elder brothers, who were the most highly endowed of a family generally remarkable for intelligence. We will quote, on this subject, some passages from a letter of the canon Mongolfier, the old president of the college of

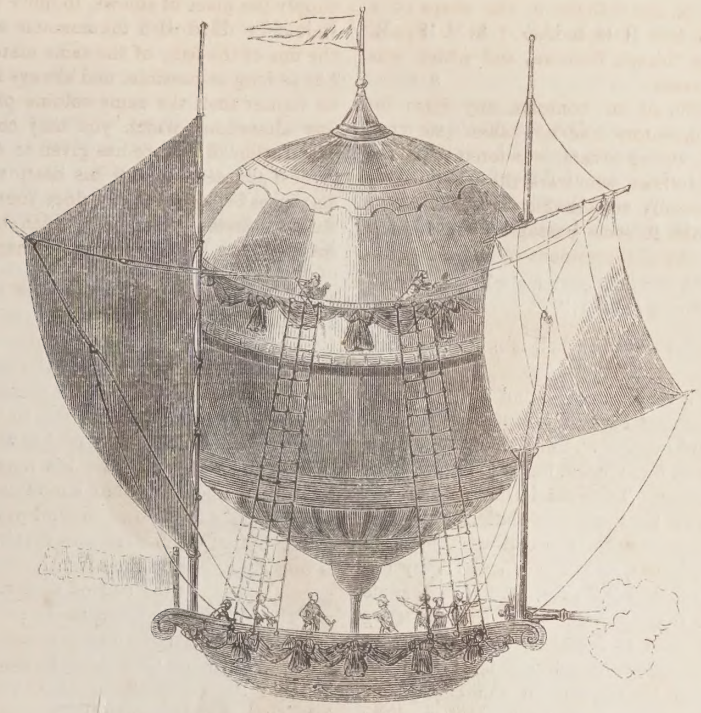
THE VOLOMANIST.—A CARICATURE OF THE EIGHTEENTH CENTURY.

Autun, dated Annonay, 1st of December, 1783, and addressed to his brother, Etienne :—

"You know that Joseph is having a large machine, from eighty to a hundred feet in diameter, made at Lyons. I joked him about it the other day in a letter which I wrote; nevertheless, this idea runs in my head, and though I am not much of a philosopher, I think I may be allowed to consider myself at least equal to Joseph, since he has written me that I have given him a new idea. Now, having sung my own praises, *revenons à nos moutons.*

"It is not exactly the form of a sheep which I should give to your machine, nor should I, like your pamphleteer, advocate that of the horse, Pegasus; but it is that of a fish, with a tail, broad, but not thick, covered with whalebone or cane to supply the place of sinews, to move this immense helm, which should be filled with inflammable air. The wings, or rather the fins of the fish, of the same material, should be of taffeta, but as long as possible, and always filled with gas, in order to be lighter than the same volume of atmospheric air—in fact, any alterations which you may consider advisable. But as the Author of Nature has given to each individual that which is best adapted to fulfil his destiny, follow the models which he places before you; and since your object is to sail through a fluid, imitate the animal which traverses a fluid with the greatest ease. You will say, perhaps, 'Why not imitate the bird?' But it is specifically heavier than the air. Your machine, being lighter, bears more resemblance to the fish, which is lighter, or at least as light as the same volume of water. The bird's excess of weight is counteracted by the great extent of its wings, compared with the size of its body, and the multiplicity and vigour of its movements. The fins of the fish would be much more economical, much easier to put in motion, and would suffice for your experiment.

"However, as we must give justice to whom it is due, the first idea was Jean Pierre's; the arguments are mine. You will tell me, perhaps, that neither the one nor the other is common sense; as I know the difficulty of a lawsuit, I will submit to the sentence, though I could dispute it, considering that to judge is not to prove," etc.



AEROSTATIC MACHINE.

AEROSTATIC FISH.

BELLS AND BELL-FOUNDING.

HISTORY OF BELLS.

It may be as well to state at once, that for much of what follows we are indebted to an amusing and well-written little book, by the Rev. Alfred Gatty, vicar of Ecclesfield, entitled, "The Bell, its Origin, History, and Uses." The author of this work has, with much patient ingenuity, traced the history of

> ——— "The crazy old church clock
> And the bewildering chimes;"

and shown in what numerous ways the bell is mixed up with our social life.

The music of bells is of a very venerable and old-fashioned character, and from the earliest ages of the world has been used in various religious and other ceremonials. It is a matter of doubt when bells were first introduced, but it is unquestionable that they are very ancient. Their origin must be sought for in the records of Egypt, the mother of nations. Recent discoveries have made it apparent that the bell was known to the inhabitants of Assyria, Etruria, and China; and Thompson, in his "Etymons of English Words," says, under the article "Bells," that, long before they were known in Europe, they were in use in Hindoo temples to frighten away evil spirits. Be this as it may, we have certain record that bells—that is, small hand and ornamental bells—were in use among the Israelites. In the writings of Moses, we have mention of the "bells of gold" with which the dress of the high priest was adorned—"a golden bell and a pomegranate upon the hem of the robe round about;" that when Aaron disappeared from the sight of the worshippers within the veil of the temple, the ringing of the bells upon his robe might be an intimation to them that he was still living in the Divine presence. Again, in Zechariah xiv. 20, there is mention of bells as forming part of the harness or decoration of horses; and it is suggested by Mr. Gatty, that even Tubal Cain, the sixth in descent from Adam, "an instructor of every artificer in brass and iron," might have scooped the sounding metal into some species of bells.

These small bells were, it appears, attached to the garments of Hebrew women, virgins, and boys, as well as to the pontifical robes. It seems, indeed, that small toy-like bells have been used in the service of religion from the earliest times; and prefixed to an old MS. edition of the Psalms of David, believed to be of the fourteenth century, is an illuminated representation of the "sweet singer of Israel," sitting before a small wooden frame, playing upon a row of bells with little hammers. This representation must, however, be considered rather as an illustration of the illuminator's own time, than as any authority for believing that hand-bells such as those represented were ever in use among the Hebrews.

The Greeks and Romans probably derived their knowledge of bells from the Egyptians, the first colonisers of Europe. The royal costumes of the shahs of Persia were also decorated with golden bells; and there is reason to believe, that in the decoration of mules and horses, as well as on the garments of the nobility of various nations, small bells were used long before the Christian era.

But not only in religious ceremonies was the bell anciently employed. Æschylus and Euripides inform us that the Greek warriors had small bells concealed within the hollows of their shields; and that when the captains went their rounds at the camp at night, each soldier was required to ring his bell, in order to show that he was awake and watchful at his post.

Bells were both Bacchic and mystic, as may be seen by reference to the ancient marbles in the British Museum; and it was from their use in the celebration of the mysteries that Plutarch endeavoured to show that the Jews worshipped Bacchus. In the triumphal entries of conquerors bells have also played important parts. They were hung as emblems and ornaments on the car of the warrior—as on that which conveyed the body of Alexander from Babylon to Egypt, as described by Diodorus Siculus; they were in use in the islands of the Archipelago to announce the opening of the markets, even as now; they were employed, as we learn from Plutarch, to detect and prevent the escape of the unhappy Xanthians. When the city of Xanthus was besieged, some of the inhabitants tried to escape by swimming and diving through the river, but nets with small bells attached were spread across the stream under the water, and by the ringing of the bells each capture was announced.

In later times we find that the garments of the chief men and civil officers among the Germans were decorated with bells. They came, too, in time, to be regarded as the messengers of sorrow as well as of joy and triumph. The criminal had a bell suspended from his neck as he was led away to execution, and its sound announced his speedy death as he walked sadly in his own funeral procession.

The period when large bells first began to be used in churches is uncertain, but by the seventh century they were in pretty general use. At the end of that century, the venerable Bede mentions their existence in English churches. Their introduction has been variously assigned to Paulinus, bishop of Nola, a town of Campania, in Italy, in the year of our Lord, 400; to Pope Sabinianus (A.D. 604), to whom the honour of introducing bells into churches is given; and to various other persons.

Bells have been known under the various names of *Tintinnabulum*, a little bell so called from its tinkling sound; *Petasus*, a larger sized bell, so named from its resemblance in shape to a broad-brimmed hat—by this latter instrument it was that the Greeks opened their fish-market, and the Romans invited the public to the bath; the *Codon*, from the Greek term, signifying the open mouth of a trumpet; *Nola*, a bell of similar size to the last, and named after the town of its inventor; *Squila*, a little bell used by the Italians; *Dodonæi lebetes*, the cauldrons of Dodona; and *Campana*, the true turret bell, so called from the town of its birth—whence Campanolo, a bell-tower. It is probable that all, except the last, were made of forged metal, and were struck on the outside by a wooden or iron hammer, and that they all, more or less, resembled flat dish-like disks. Indeed, the very word Bell is said to come from the Latin *pelvis*, a basin or foot-bath; and if this be so, the configuration of ancient bells is at once determined.

In the history of the church of the middle ages the bell had much to do. First, it was christened with all ceremony; then it was employed in the various services of the day, convoking congregations, excommunicating the disobedient and the infidel, and, finally, being tolled at the moment when the spirit passed from out the earthly body. The ceremony of Christian baptism was certainly one of the most curious observances connected with the bell's history. The fused metal was blessed by the priests; and then when the bell was turned out perfect from the mould, it was regularly passed through the ceremonies of baptism. Its sponsors were persons of rank, and the most considerable priest, or even a bishop or archbishop, officiated—with all the accompaniments of naming, anointing, sprinkling, robing, &c.

Excommunication by "bell, book, and candle," was long practised. The bell was rung to summon the congregation to this ceremony; the priest read the service from a balcony; and when the anathema was pronounced, the candles were put out, as an emblem of an extinction of hope in the sinner's soul.

The Complin bell it was which summoned the people to the last religious service of the day. The Sanctus bell was formerly hung in a small turret outside the church, as may still be seen in some of our old churches; it is now merely a small hand-bell, which is rung during the service of the mass, to call the attention of the congregation to its more solemn

parts. The Passing bell was so named because it used to be tolled as the spirit passed out of the body.

"Prayers ascend
To heaven in troops at a good man's passing bell,"

says Donne, in allusion to the fact, that at the sound of the passing bell, all who heard it were enjoined to pray for the soul of the dying. From this custom is derived that of tolling the church bell at a funeral.

Everybody has heard of the *Couvre feu*, or Curfew Bell, which was introduced into this country from France by William the Conqueror. At eight o'clock in the evening it rang out its evening peal, and at the last stroke of the hammer on the metal, all lights and fires were ordered to be put out. We will now enter

THE FOUNDRY,

And describe the modern process of bell-casting. For illustration we will take the establishment of Messrs. Mears, Whitechapel, the oldest, largest, and best known of the kind in London or England. Before we describe the process of casting a bell, it will be as well to inform the reader that bell-metal consists of an amalgam of copper and tin in the proportion of about three parts of copper to one of tin. Mention has been made of the old custom of adding a few gold or silver coins to the metal when in a state of fusion, but it is quite a popular error to suppose that the metal of old bells is of greater value from such a circumstance. The actual value of bell-metal, when formed into bells, is about £6 a cwt., including the cost of production; and when old bells are received in exchange, it is usual for the founder to allow about £4 per cwt. for the metal inclusive of the silver it may or may not contain.

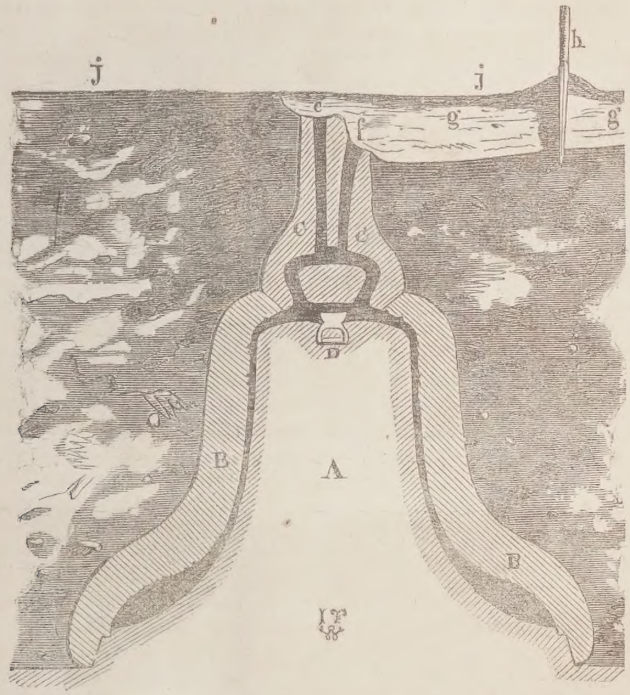
There are, of course, various trade secrets as to the exact proportions of the different metals necessary to constitute a first-rate amalgam.

There is no great mystery in the bell-founder's art; but extreme care is necessary, in order to produce a good-toned bell, that all the preliminary operations should be conducted with the greatest exactness. With the aid of our artist, then, we will endeavour to explain the *modus operandi* observed in founding or casting a bell.

Passing through various yards, in which are stored quantities of old timber, old bell-metal, and a multitude of odds and ends, in the shape of old cannons and great masses of old copper, destined one day for the furnace, we arrive at the

MOULDING-ROOM.

Here a sight presents itself which is at once peculiar and striking. All along the floor are ranged the moulds of future bells. In describing the casting of a bell, it will be necessary to observe, that it is nothing more than a layer of metal which has been run into the space between the mould and its outer covering, and allowed to cool. A glance at the accompanying diagram will explain this very readily. Here we have a section of a bell as it lies in the pit during the process of casting. If the reader keep this diagram in his mind's eye, he will have no difficulty in comprehending all that we may have to say on the subject. The various parts of a bell may be described as the body or barrel; the clapper or striker, hanging in the inside; and the ear or cannon on its top or crown, by which it is hung in its chosen position in the tower. The following description, therefore, applies to all bells, large and small, the various modifications in the shape, &c., not interfering with the principle on which it is manufactured.



SECTION OF A LARGE BELL, WITH THE MOULD AND COPE, AS IT LIES IN THE PIT.*

The first principle to be observed is the construction of the shape or form of the future bell, so as to insure that due harmony in all its parts which shall give to it the proper degree of tone and vibration. Various theories have obtained in different countries, and among the several founders of our own country, as to the best proportions for bells; but the following scale has been proposed, and generally followed as coming nearest to perfection: "Taking the thickness of the sound-bow or brim—that is, the part where the clapper strikes—a bell should measure: in diameter at the mouth, fifteen

* A is the inner mould or core; B is the outer mould or cope; C is the crown or head, which is made independently of the other moulds, and is fitted on accurately just before the pouring in of the fused metal represented by *e*, which is running from the furnace in a glowing mass, *g g*; *f* is the hole left for the escape of the air between the two moulds; *h* shows the method employed in stopping off the supply of fused metal, so that the stream may be directed into a new channel; *j j* shows the earth surrounding the bell and mould; D is the metal ring to which the clapper is afterwards to be hung, and which is affixed when the casting of the bell is completed, the configuration of which is shown by the black line between the inner and outer moulds.

FIG 3.—FINISHING THE CORE—THE CROOK.

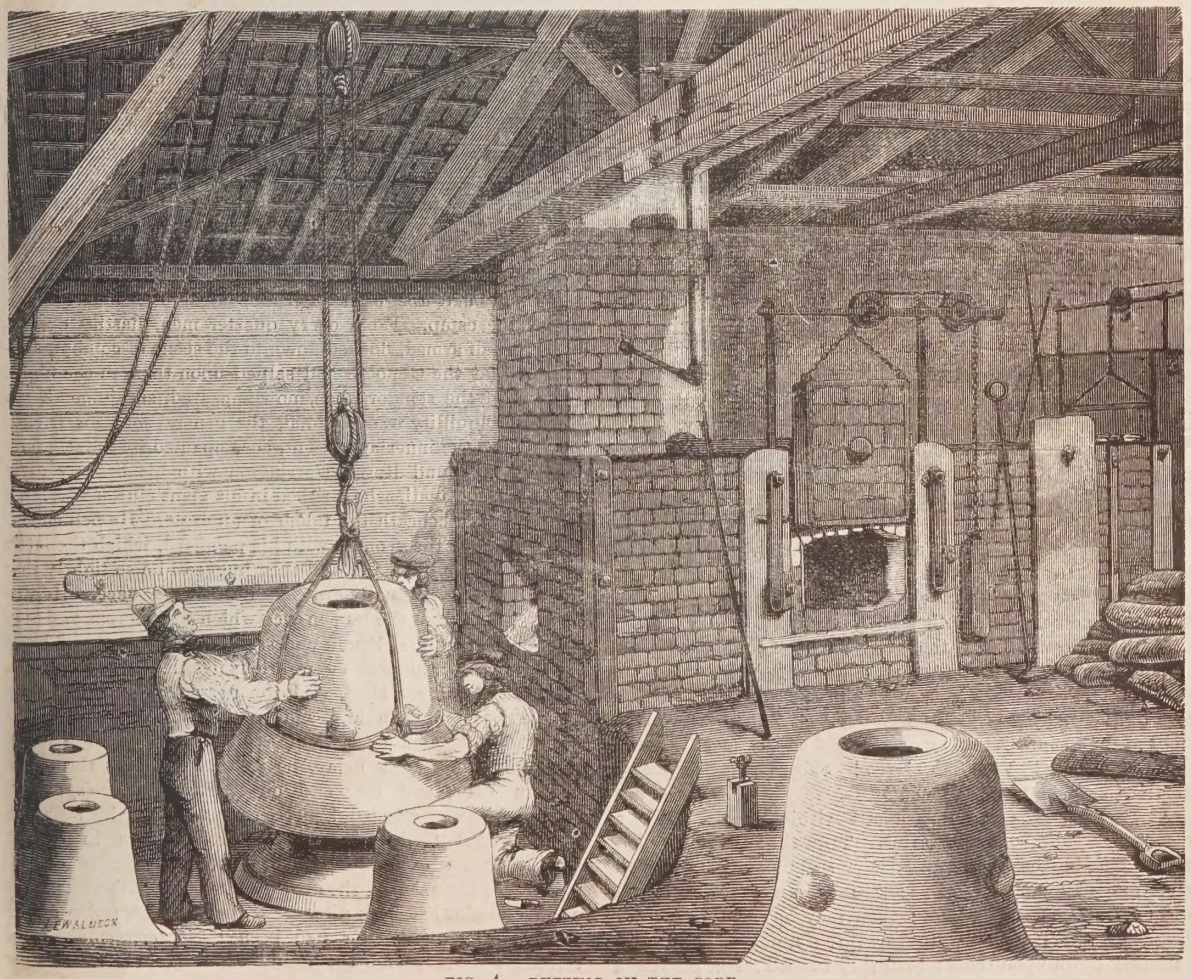

FIG. 4.—PUTTING ON THE COPE.

brims; in height to the shoulder, twelve brims; and in width at the shoulders, seven and a-half brims, or half the width at the mouth." These proportions, however, are very variable, and depend greatly on the taste, experience, and skill of the founder, an approximation merely being arrived at in these figures.

The size and proportions, then, of the future bell being ascertained, the making of the mould is proceeded with. The *outer* form of the mould—by which the *inner* shape of the bell is determined—is made by means of a *crook* which is made to revolve on the clay, &c., of which the mould is composed. This *crook* is a kind of double compass formed of wood, one leg of which is cut or curved to the shape of the inner sides of the intended bell. A glance at the engraving (fig. 3) will render this plain to the reader. This crook or compass is made to move on a pivot affixed to a beam above, and its lower end driven into the ground. In the case of very large bells, the mould is perfected in the pit in which they are to be cast. The crook is driven by the hand of the moulder; and the mould being composed of plastic clay, &c., the form of the inner side of the bell is defined by a few revolutions of this simple machine. Thus is formed the *core*, or inner mould. The *cope*, or outer mould, is formed in much the same way, except that its inner surface is smoothed to form the outer side of the bell.

The *core* is first roughly built up of brickwork with a hollow in the centre. It is then plastered over with soft clay, &c., and moulded as described by the action of the crook; and is afterwards dried by means of a fire in the hollow mentioned. When baked sufficiently hard it is covered all over with a composition of tan and grease. On this composition the outer leg of the crook is made again to rotate, and the exact shape of the bell is thus determined. When the whole has been sufficiently dried by the action of the fire in the *core*, the crown or head—which contains the parts necessary to hold the clapper by which the bell is to be rung—are then fitted on, and the model of the inside of the bell may then be said to be complete. Any device or inscription necessary is then moulded and fixed upon it. Upon this mould the *cope*, or outer mould, is formed. Having been made of destructible materials, the *fac-simile* of the bell is easily destroyed, and the space between the *core* and the *cope* is, of course, the exact shape of the future bell. The inner and outer moulds being examined, retouched, and otherwise finished off, the cope is fitted over the core (as represented in figure 4) like an extinguisher over a candle, with a vacuum left between them to receive the fused metal. One indispensable precaution is necessary, however, in making the mould, that is, to leave a hole for the escape of the air when the metal is poured in, the failure of which would cause the destruction of the bell in the process of casting. This hole is left in the cap of the mould.

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER XVI., PART II.

"Tie your baldric over his mouth and gag him, Hodge," said Cheke—and the archer in a moment executed the command. And now the outer door was assailed with thundering strokes of lances and axes—the sentinel, after an ineffectual resistance, retreated into the inner apartment. Zeno and his little band stood cool and collected, awaiting with drawn swords the entrance of Recanati's lancers—for they indeed it was who had, upon the expiration of the appointed time, rushed down to the general's quarters, which they reached just at the moment when their captain had called upon them to rescue him. More and more furious came the thundering blows on the door, mingled with the cries and imprecations of the assailants. At length the massive oak gave way, and with a loud crash was burst inwards. A rush of feet succeeded, and the small outer apartment was rapidly filling with the excited soldiery.

"Now, brave knights and worthy companions, stand together," said Sir William Cheke, springing to the front. "Form with me, and stand firm. Let us fight for God and the republic."

With a cheer the captains answered his call, and the small but brave band stood calmly awaiting the charge of the lancers. The first that entered was cleft down by the strong arm of Cheke. Another and another succeeded to the place of the fallen man, and shared the same fate. Then two rushed forward and forced an entrance, and the fight became more deadly. Others pressed from behind, and the room was speedily filling, the contest becoming fearful in the flickering light of the room. At this moment loud shouts rent the air.

"Piantaleone! Viva San Marco! Saint George for merry England! Zeno to the rescue!"

At these sounds the combatants within paused as by a common impulse, and took breath. Then the rush of a multitude, tramping heavily, came nearer and nearer. There was a clashing of weapons without: those who were furthest from the door swayed to and fro; then they turned to meet the English archers and the troops of the republic that came furiously down upon them; then they rushed forth, pell-mell, into the dark night, leaving those within unsupported. At this moment Zeno and his band charged them with fresh ardour, and drove them backwards, slaying them as they retreated through the door and the outer apartment. Then they drove them into the open air after their companions, where they were met in the rear by the archers, and hewed down unsparingly. At length the lancers of Recanati broke into confusion and fled, leaving a considerable number dead and dying, and Zeno and his faithful allies remained alone in the darkness, after a fearful struggle with those who were the paid soldiers of the republic. Meantime, the tumult of the fight, and the cries of the combatants, had aroused the whole camp. From every quarter men, hastily dressed and but half armed, flocked down to the scene of combat, supposing that the Genoese had sallied upon them in the night. Several of the senators, too, now appeared, and joined Zeno. When tranquillity was restored, the general and his friends returned to the inner apartment, accompanied by the senators. There they found Roger Harrington with his brawny arms encircling Recanati, who writhed in his giant clutch as a lamb would quiver beneath the talons of an eagle. He had endeavoured to stab the yeoman with his poignard, which the latter wrenched from his hand, and then hugged him so tightly that his victim was gradually growing livid in the face. He was now released from the human vice which had so remorselessly tightened upon him, bound and seated. A court-martial was hastily formed, the proofs were briefly detailed to the senators, his person was searched, and the document given him by Hodge was found on him, and it was decided that Recanati should be handed over to the civil power of the state. Without a moment's delay, he was hurried out through a postern door, and conveyed on board the doge's galley. When this was effected, Zeno, accompanied by the senators, again issued forth amongst the troops, who in crowds awaited some explanation of the strange events of the night. In the name of the state he proclaimed the fact, that a horrible plot had been discovered for the destruction of the troops; that the traitor had been tried, condemned, and already removed, and the safety of the republic was now secured. By degrees the soldiers retired, breaking up in

groups, and discussing the exciting intelligence; and peace and silence once more reigned throughout the camp at Palestrina.

While these events were taking place, the Genoese at Chioggia in vain awaited the signal-light. At length the sound of the tumult and the cries of the men in the distance were borne to their ears through the night. Conjecturing that the concerted rising of the conspirators had begun, and that by some casualty the signal had either not been made or had escaped observation, the whole of the besieged threw open the gates and sallied from the town in arms. But on a nearer approach they soon discovered the true posture of affairs, and after pausing to listen, they were convinced, by the triumphant cries of "Viva la Venetzia! Viva Zeno!" that the plot had failed. They turned and fled back in dismay, and shut themselves up once more within the walls. That night a council of war was hastily summoned. The deliberation was short, for little choice was left to the besieged. To resist further insured a lingering death by starvation; to surrender left some chance of life. Accordingly, it was determined to submit to the cruel necessity; and at the first light upon the following morning envoys were dispatched to Palestrina with unconditional offers of surrender. These were of course accepted, and upon the 24th of June, Carlo Zeno had the satisfaction of finding his own policy triumphantly justified by the event. The gates of Chioggia were thrown open to the troops in the service of Venice; the town was given up to unrestrained plunder; and the besieged, consisting of Genoese and Paduans, were led as prisoners on board the Venetian galleys; while the Genoese fleet, under the command of their admiral, Muraffo, weighed anchor, and sailed away to Fossone.

Meantime Recanati had been sent to Venice the day after his arrest. He was immediately brought before that terrible and secret tribunal from which even the innocent did not always escape—the guilty had but little to hope. At first the stubborn condottiere refused to answer any interrogatories put to him by his judges, maintaining a haughty and dogged silence. Then he was "put to the question," and the tortures of the rack broke down his resolution. He confessed all, was formally adjudged guilty of treason against the state of Venice, and was condemned to death. His judges determined that his punishment should be as exemplary as his offence was aggravated. He was crucified between the porphyry columns in the Piazza di San Marco.

The war of the Chioggia was now virtually at an end. The mercenary troops in the pay of Venice were no longer needed by the state, and having received their full pay and helped themselves to such treasures as they were able, began to seek for employment and adventure elsewhere. The last of these bands to leave Palestrina was that of Sir William Cheke; and on the morning of his departure Zeno and he stood in the quarters of the latter, and conversed long and confidentially together. The intercourse of many months had exhibited to each the character of the other, and had inspired mutual esteem and admiration, and it was not without a lively sorrow that these two valiant soldiers were now about to separate.

"Be it so, my dear friend," said Zeno, continuing something that he had been saying in a low but earnest voice; "be it then as you wish. I shall urge you no more on that point. But forget not that while Carlo Zeno lives thou hast ever a true and loving brother; and the state of Venice esteems thy services highly. May she ever remember them gratefully."

And Zeno sighed, for he knew but too well how that fickle republic had often requited the services of her bravest and her best.

"But whither now, Sir William," he continued cheerily, as he watched the English archers busily employed making preparations for their march; "whither mean you to lead these merry fellows of yours?"

"In good faith," said Cheke, with a careless laugh, "I scarce know as yet. But there will be no lack of work for stout soldiers, and I can choose where I shall pitch my tent. At the present, I am minded to join Alberic, the lord of Barbiano. He is the most accomplished soldier of the age."

"His fame as a general has spread over all Europe," said Zeno, "and thou wilt find many a brave knight amongst the 'company of St. George!'"

"Aye, 'tis a school that has reared the best generals of Italy. Then, there is my own countryman, Sir John Harlestone, a valiant captain who now holds Cherbourg for our young King Richard against Charles of France. There will I meet with some of my old comrades in arms, Sir John Auboure and Sir Otho de Granston. Besides, I think my merry archers would wish once more to fight beside their own countrymen."

"Well, well; good Sir William, thou canst not fail to gain honour wherever thou goest. But who is that yonder who sings so cheerily as he ties up his bow in its sheath? Unless my eyes deceive me, it is my trusty Hodge."

"It is no other, signore, he hath ever the quickest hand and the blythest voice in the company."

"I would see him, Sir William. We have some accounts to settle. Call him hither."

Hodge was soon standing drawn up to his full height before Zeno, and with a military salute awaited his pleasure.

"Good fellow, I owe thee somewhat, and would fain pay thee at once."

Hodge looked inquiringly, and then said, "I have had my full pay, general, and managed to pick up somewhat for myself to boot when we searched Chioggia."

"Honest and faithful ever!" said the general, musingly—"honest and faithful, like all his race,"—then a sudden thought struck him, and he addressed Hodge again,—

"What say you, Hodge, to a change of masters—supposing that Sir William here consents—wilt thou enter into my service?"

Hodge looked from one to the other, and then replied—

"Noble general, I shall never serve under any other captain than Sir William Cheke. When I leave him I shall make my way back to England."

"What, you have not yet forgotten home—Is't so, Hodge?"

"Forgotten! forgotten my home—merry England and her forests and her greenwoods—and my father's cottage by the pleasant Trent—and—and—" The poor fellow stopped short, a tear was glistening in his blue eye, and something like a sigh half escaped from his bosom.

"And what, Hodge?" asked Zeno, then finishing the sentence for him at hazard—"and some fair maiden that thou wottest of, who dwells not far from that same cottage. Eh, good fellow, have I guessed truly?"

"In faith, signore," said Hodge, who had quickly recovered his lightheartedness, "your excellency is not far astray; there is such a one in the valley of the Trent—or there *was*, when last I trod the greenwood by the river's bank, and we plighted our troth for ever. And so, noble sir, I long to return and see if Marian be still true and living, and I count the months and days till I shall have saved enough in the wars to return to Nottingham, and have wherewithal to keep a wife in smocks and the pot boiling."

"Then thou shalt long no more, my worthy fellow. Here, this purse is thine; take it, man; I tell thee thou hast earned every golden florin in it. I brought it hither for thee expressly to-day. Thou'lt find it enough for all thy simple wants when thou reachest thy English forest."

The archer took the heavy purse, frankly and gratefully.

"I thank you, signore; it is enough, and more than enough. It will often furnish me with a jug of brown ale to drink to your health in."

"Aye," added Zeno, slyly, who knew England well, "and it may be, now and then, a steak of juicy venison, if fat bucks be as plenty in England as they were in my time."

Hodge smiled, and then making his military salute, was about to retire, but Zeno reached out his hand cordially to him.

"Nay, we part not, comrade, without one friendly grasp; the hand of an English soldier may clasp that of the noblest in Europe."

IDIOTS AND IMBECILES.

These terms are not synonymous, although it is often difficult to distinguish between the Idiot and Imbecile, and both require similar treatment. The congenital idiot usually possesses a retreating forehead, whilst the imbecile may have a well-formed head. In the former there may be a deficiency of brain; in the latter, there is weakness of brain. To develop the one and strengthen the other are the objects aimed at in their tuition. Too frequently classed with the lunatic, as though *deficiency* or *weakness* of brain were the same as *perversion* of brain, the idiot's special condition has been much overlooked.

Various have been the opinions formed, in different ages, of this afflicted portion of our fellow-creatures, and equally diverse their modes of treatment. By Hindoos, they have been regarded as objects of superstitious veneration; by some Europeans, as human beings without souls. It is even related of Luther that, when asked by a father what should be done with his idiot boy, he replied, that the child might be drowned, as he possessed no soul. Striking instances are related by Dr. Howe, of America, of ignorant treatment practised by poor parents whose children were idiots. By some, tan poultices were applied to soften the brain; by others, tar was put on to harden the brain, considering softness or hardness to be the cause of idiocy. In our own country, the poor idiot has been the frequent butt of ridicule and scorn. Proud human nature despises inferiority in a fellow-creature; hence, the taunts and jeers so familiar to the crippled, the blind, the idiotic, and imbecile. Happily, however, for the latter, various establishments have been opened within the last twenty years for their especial benefit. Foreign countries led the way in this benevolent enterprise; but England, as usual, has outstripped them all in the magnitude of its operations and the amount of public interest that has been excited.

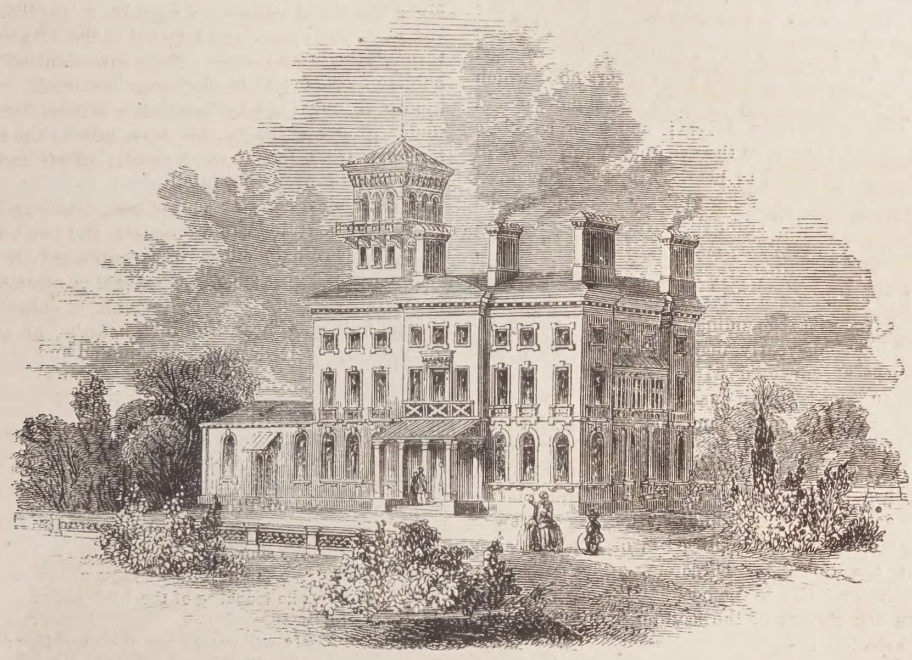
At the Bicêtre in Paris, a scientific gentleman was among the first to give particular attention to the training and education of idiots and imbeciles. Much skill and perseverance, for some time, marked his efforts, and striking improvement was manifested in his pupils. He wrote a valuable work upon the subject, and, after a visit of inspection, Dr. Conolly's important testimony was borne to the success of the operations. At the Abendberg in Switzerland, an establishment was opened for the cure of Cretins, about the year 1840, by a benevolent physician named Dr. Guggenbûhl. Cretinism is a species of idiocy, and mainly caused by the unhealthy dampness of the Swiss valleys; the goitre, or swollen neck, is very common in such cases, and removal to the lofty mountain tends much to promote recovery. None are admitted above the age of seven years, and the judicious treatment, combined with kind instruction, has been productive of most beneficial results. There are about twenty-five cases now in the establishment. In Berlin, Wirtemberg, and Bavaria, efforts have been made on behalf of cretins and idiots.

Directly after the subject had been taken up in England, it received some attention in America, and two very interesting reports, in successive years, were published by Dr. Howe, of Boston. Being appointed by the local government as a commissioner, with two other individuals, to collect facts relative to idiots in the State of Massachusetts, he obtained some highly interesting information with regard to the causes of idiocy, as well as the prevalence of the malady. At the conclusion of the inquiry, which extended to between five and six hundred cases, a portion of the building devoted to the instruction of the blind was set apart as a school for idiots, under the supervision of Dr. Howe. The expenses were borne by the government, but the number of pupils for the first three years was limited to ten or twelve. At New York, a somewhat similar course has been adopted, and a school was commenced about two years since. The report for 1853 is highly encouraging, and a new building is proposed, whereby the number of pupils may be increased from thirty-five to one hundred or one hundred and fifty.

PARK HOUSE, HIGHGATE.—ASYLUM FOR IDIOTS.

In England, various independent efforts have been put forth at Bath, Brighton, and Lancaster. But the institution which claims attention beyond all others, is the Asylum for Idiots, to which the accompanying engravings refer. This is a national charity which is open for cases from all parts of the kingdom. The gratuitous admissions are regulated by the votes of subscribers at half-yearly elections, and the successful candidates

are admitted, free of all charge, for five years' training and instruction. Cases are also admitted at the rate of twenty-five guineas per annum, when the friends are unable, from limited means, to meet the higher grades of payment. It is the largest institution in the world, as far as at present known,



ESSEX HALL, COLCHESTER.—ASYLUM FOR IDIOTS.

for the education of idiots and imbeciles, and the efforts sustained by Christian benevolence have proved far more effective than those dependent upon state support. Ushered into existence by a few individuals, in the time of monetary panic,

EARLSWOOD, NEAR REIGATE.—NEW ASYLUM FOR IDIOTS.

this asylum has made a rapid progress, almost unparalleled in the annals of Christian philanthropy. One of the present honorary secretaries, Dr. Andrew Reed (to whose untiring exertions and remarkable tact its success is mainly owing), visited some of the establishments on the Continent which have been referred to, and upon his return, in the autumn of the year 1847, decisive steps were taken. The institutory meeting was held at the London Tavern, Bishopsgate-street, October 27th, 1847, under the auspices of Sir George Carroll, Lord Mayor of London, who took the chair upon that occasion, and has since presided at several elections. Including 100 guineas sent by the late Sir Charles Forbes, the subscription list only amounted to about £350. An election of ten pupils took place in January, 1848, and six more were elected in the following April. A large building at Highgate, called Park House, of which an engraving is given on the opposite page, was opened for the reception of pupils, April 27th, 1848. In less than two years this became full, and a very liberal offer, made by S. M. Peto, Esq., M.P., with reference to Essex Hall, Colchester (of

which an illustration is also supplied (p. 269), was gladly accepted by the committee. Again has the accommodation proved inadequate, and the temporary occupation of a third house, situated near to Essex Hall, has been obtained. There are about two hundred and fifty pupils in the asylum, and nearly two hundred applicants for admission. Meanwhile some special efforts have been made with reference to a new building which is intended to accommodate four hundred pupils, and to be a model asylum for the training and education of idiots and imbeciles. We present our readers with a sketch of the proposed building (p. 269). Highly interesting was the ceremony which took place on the 16th of June last, when the first stone was laid by his Royal Highness Prince Albert; and after a public dinner, at the London Tavern, in the evening, the proceeds of that auspicious day amounted to nearly £10,000. Favoured with the immediate patronage of her Majesty the Queen, who has purchased a life-presentation for the Prince of Wales, and sanctioned by leading physicians, such as Sir James Clark, Sir John Forbes, Dr. Conolly, Dr. Sutherland, and others, this institution has called forth a large amount of Christian sympathy and received a corresponding share of public support. Notwithstanding the half-yearly increase of numbers, and the unusual expenses connected with this peculiar family, the committee have thus far been enabled to keep the annual expenditure within the income, and more than half the amount required for the new building has been already contributed. The Rev. Edwin Sidney, M.A., rector of Cornard Parva, Suffolk, has proved a very valuable friend to the charity by many acts of kindness, and by attending no fewer than ten public meetings in different parts of England, as a deputation from the Board of Directors. The following interesting statement relative to the occupations of the pupils is extracted from the Report of the asylum, which was read at the last April election :—

"Ninety-eight pupils are daily engaged in reading and spelling.

Eighty-six in writing.

Twenty-five in drawing.

Twenty in gardening.

Twenty-eight in sewing, knitting, &c.

Sixteen boys in willow-plaiting.

Five boys in each class are respectively—basket-makers, shoemakers, and tailors.

Six are occupied as carpenters.

Sixteen are engaged in domestic work.

Twenty take lessons in dancing.

Seventy have object-lessons.

Eighteen write from dictation, and learn geography and arithmetic.

A hundred and one are drilled and take gymnastic exercises.

Thirty-nine have speaking lessons.

A hundred and forty-nine attend domestic worship.

A hundred and four attend public worship.

The greater part of the family are practised in singing, and some are taught on the harmonicon."

The numbers have been considerably increased since April. Mat-making has been introduced with considerable success at Essex Hall, and the following particulars, lately published, will be read with interest,—

"Forty-two boys were dumb, and forty-eight had very imperfect speech on admission; twenty-four have so much improved as to be able to articulate plainly. Ten girls were dumb when admitted, and sixteen had imperfect speech: eight have greatly improved in this respect."

Stimulated by the excellent example thus set, a few local institutions, on similar principles, are contemplated in distant parts of the country; particular attention has been given to idiots and imbeciles in several union-houses and county lunatic asylums, and their general susceptibility of improvement has been clearly established. By parliamentary returns, made up to the 1st of January, 1847, it appeared that there were 7,636 pauper idiots in England and Wales. Although idiocy seems to prevail chiefly in the lower orders of society, yet, being found to a considerable extent amongst all classes, it is probable that there are not fewer than 50,000 idiots and imbeciles in Great Britain and Ireland.

The causes of idiocy and imbecility are various. The treatment requires to be specially adapted to the particular cases, and to be marked by much tact and kindness, combined with firmness, patience, and perseverance. Drilling, gymnastics, and other exercises in the open air, such as gardening, &c., are particularly important, from their tendency to strengthen the muscular system and improve the circulation of blood through the brain; while the military movements also train to habits of order and obedience. The religious affections and kindly feelings are remarkably susceptible of development under proper culture. Love of music is a general characteristic; taste for dress is often prevalent, and the senses predominate over the intellectual faculties. By judicious treatment, most can be rescued from their natural helplessness; many may be trained to mechanical pursuits, rendered useful in the subordinate offices of civilised life, instructed in the rudiments of knowledge, and prepared at last for a glorious immortality.

The following beautiful lines on "The Teaching of the Idiot-born," well deserve to be quoted and taken to heart.

THE IDIOT-BORN.

"Out! thou silly moon-struck elf;
Back! poor fool, and hide thyself!"
This is what the wise ones say,
Should the Idiot cross their way:
But if we would closely mark,
We should see him not all dark;
We should find we must not scorn
The teaching of the Idiot-born!

He will screen the newt and frog;
He will cheer the famish'd dog;
He will seek to share his bread
With the orphan, parish fed;
He will offer up his seat
To the wearied stranger's feet.
Selfish tyrants, do not scorn
The teaching of the Idiot-born!

Use him *fairly*, he will prove
How the simple breast can love;
He will spring with infant glee
To the form he likes to see;
Gentle speech or kindness done
Truly binds the witless one.
Heartless traitor, do not scorn
The teaching of the Idiot-born!

Art thou great as man can be?
The same Hand moulded him and thee:
Hast thou talent?—taunt and jeer
Must not fall upon his ear:
Spurn him not; the blemished part
Had better be the *head* than *heart*.
Thou wilt be the fool to scorn
The teaching of the Idiot-born!"

In conclusion, it may be desirable to refer to the buildings delineated in the accompanying engravings. Park House, Highgate (the premises first occupied), was formerly a nobleman's residence. It is fitted up with a large green-house, and surrounded with spacious garden-grounds. The situation is elevated, and the scenery picturesque in the directions of Finchley, Barnet, and Hornsey. It contains about seventy-five pupils, for whom baths, gymnastic apparatus, and other advantages have been provided. The establishment has been honoured with a visit from his Royal Highness Prince Albert, and was twice visited by the late Duke of Cambridge.

Essex Hall, Colchester, is situated close to the Eastern Counties Railway station, and was erected, at great cost, as a large railway hotel. It is in the Italian style; the rooms are lofty and numerous, so that the whole premises accommodate about 170 individuals. There are baths and gymnastic

appliances, workshops have been provided, and the extensive grounds afford ample scope for healthful exercises. It is intended that Essex Hall shall be specially appropriated to the eastern counties.

Earlswood Estate is delightfully situated at Red Hill, near Reigate, Surrey, and closely borders upon the grounds of the Philanthropic Society. It comprises about one hundred acres of farming land, and was obtained on very advantageous terms. The farm is worked under the honorary supervision of Mr. Clarke, known as an agricultural judge, and the implements have been gratuitously supplied by the large agricultural implement makers. The building is to be in the composite style, between English and Italian, and great pains have been taken in maturing the plans, that classification, comfort, and scope for useful employment, may be duly provided for its peculiar inmates. In about eighteen months the erection will be completed, and the opening is to take place with much ceremony.

THE MAN OF THE ROCK.

As I was descending the Saône, in 1836, upon a light steamboat, I was charmed, at the entrance to Lyons, with the beauty of the view presented by the right bank of the river, where the country gently glides into the suburbs and is lost amid the structures of the town. Meadows, woods, rocks, the limpid stream, mingled with elegant terraces, graceful pavilions, noble buildings, hanging bridges, a fine quay, and all the bustle of a port which shared the commerce and the population of the north and of the south. One point of the picture, particularly, attracted my attention by its singularity. Upon the platform of a perpendicular rock, which projected over the quay towards the river, I caught a glimpse of a certain irregular mass which appeared to be the remains of some rude wooden statue. It consisted of a coat of mail, supported upon two legs adorned with red boots. The boat carried me onwards, I moved towards the stern, but could no longer distinguish the fantastic figure. The sailor at the helm, noticing my disappointment, said with a smile, "It is the Man of the Rock;" and to my look of inquiry, he added, "Yes, the good German." I was about to ask a further explanation, when, perceiving that his attention was directed to the difficulty of steering the vessel among the small craft which thronged the port, I subdued my curiosity, promising myself the pleasure of a visit to the coat of mail the same evening, and, if possible, to learn its history. But the monuments of Lyons, its church of Saint Jean, its valuable museum, the junction of the Rhône and the Saône, occupied all the hours of my day, and the next morning before day-break, I went by torch-light on board the Rhône boat, which was to carry me to Avignon; I thrilled with the thought of Italy, and had entirely forgotten the Man of the Rock or the good German.

Thirteen years afterwards, in the autumn of 1849, I was travelling in a contrary direction, on my return to Paris, and on leaving Lyons I perceived on my left the same rock; but in place of the coat of mail, a fine stone statue now stood upon it. The boat had not yet started, so I had time to observe that this statue represented a man of middle age, without coat of mail or boots, but in the costume of the sixteenth century, holding in one hand a manuscript to his breast, and in the other a purse. This time I addressed my inquiries to a young gentleman who appeared to be a native of Lyons, and a student. He kindly listened to my question, and replied: "This statue was inaugurated last September, and has taken the place of a number of grotesque wooden figures, which for several generations the inhabitants of this quarter (Bourgneuf) have been accustomed to place upon the rock. The poor people, having neither stone nor bronze wherewith to construct their idol, cut down a tree from the neighbouring wood, and rudely fashioned it into the figure of a man with coat of mail, a lance, and a helmet. When the worms and the water had destroyed this strange statue, it was replaced by a similar one, and the day on which the good man took his place upon the rock was a fête day for all Bourgneuf. The last of these solemnities took place June 24th, 1820. Ten or fifteen years afterwards the figure was horribly mutilated, our archæologists and our poets were indignant, and a sort of conspiracy was formed to compel the municipality of Lyons to replace that caricature of wood by a stone statue. They succeeded, and the people of Bourgneuf may now rest; they need no longer tax themselves, or to go to the wood for a tree, as they have done for some years. If they wish to do honour to the 'Man of the Rock,' they may do it without expense. Perhaps their fêtes may be wanting in the simple joyousness which characterised them in former years, but taste must not be offended, art must not be desecrated. Away with our fêtes, if it must be so, away with the simplicity and barbarism of the ancient times!"

At these words, foreseeing a digression, I took the liberty of interrupting him. "Thanks," said I: "as a question of art, your view of the subject is quite satisfactory; but, pray, to the memory of what great man have these statues of wood and of stone been erected?"

"Learned men smile," replied my polite informant, "when they hear of the 'Man of the Rock.' They say that the people of Bourgneuf were accustomed to erect an idol of wood in honour of a certain governor of the castle of Pierre Scise. In course of time, although the governor was forgotten, the custom was preserved, and the honour transferred to a German, Jean Kleberger, an inhabitant of Lyons, from 1533, until his death in 1546. He founded the Hospital of Charity. During a period of scarcity he distributed considerable sums to the poor of the city; and every year he gave dowries to seven poor girls. A recent publication will give you a further account of this benevolent man: you may find it in the boat's library."

I thanked the young gentleman; and as we had just arrived at a landing-place, he jumped into a little boat, and left me. While breakfasting, a few minutes afterwards, I turned over a volume of the "Revue du Lyonnais," where I found the following account of the Man of the Rock:—

"Jean Kleberger was born at Nuremberg in 1486. His father, himself a merchant, placed him with the wealthy house of Imhof, which possessed a mercantile establishment at Lyons. It appears that Jean Kleberger afterwards entered the army, and distinguished himself at the battle of Pavia, February 24, 1525. There are in existence two medals, one in the museum of Nuremberg, and the other in that of Vienna, which seem to have been struck to commemorate his deeds of renown, as they bear inscriptions and coats of arms. However, as we know that it was not unusual in the sixteenth century, among persons of wealth and distinction, for such medals to be executed by private commission, and at private expense, as we now have our busts and our medallions, it would be desirable, before assuming the warlike renown of Jean Kleberger, to have more positive testimony of it. But be that as it may, it is very evident that he was a celebrated man in his own country. His portrait, painted in oil, upon wood, by Albert Durer, may still be seen in the imperial gallery at Vienna. Kleberger went to Lyons in 1527, but returned to Nuremberg, and the following year married Felicitas Pirkheimer, daughter of Wilibald Pirkheimer, of the house of Imhof, a friend of Albert Durer, and councillor of Charles V., as he had also been of Maximilian. It is possible that the death of his wife, May 29, 1530, determined him to settle in Lyons, where he arrived in 1532. In 1535, he married Pelonne de Bonzin, afterwards known as the 'beautiful German.' By this union he had one son, David Kleberger, born 1538. Jean Kleberger was elected alderman December 1,

1545, and died September 6, 1546, at the age of sixty-one years.

"He presented, at different times, to the Hospital of Charity, of which he was the founder, the sum of 8,045 livres, equal to about 70,000 francs (£2,800).

"He was no less charitable to the poor of Geneva than to those of Lyons. The public registers of Geneva contain the following notice:—

"'June 7th, 1527.—Jean Cleburgue, a wealthy German, residing at Lyons, applied to the Council respecting the purchase of a house which had belonged to Cartelier, to which they consented.'

"'March 22nd, 1540.—Jean Cleburgue, having greatly benefited the hospital, a grant was made to him of 300 loads of stones, from the temple of Notre-dame de Grace, to finish his wall of Saint Gervais.'

"'April 22nd, 1544.—Jean Cleburgue, of Lyons, gave fifty crowns to the hospital, on which occasion they presented him with a dozen pies.'

"At his death he bequeathed 400 crowns to the hospital of Geneva. In 1543, he presented to the city the gardens of Saint Gervais, near the lake, and those gardens took from him the name Cleburgue, which in time became Bergues, upon the site of which now stand some of the finest hotels of Europe.

"His arms are still to be seen over the door of the house in which he resided at Lyons, now No. 93, in the Rue des Forges. He had also a castle, at a little distance from Lyons, in the Terre de Champ, where was the tower of the 'Beautiful German.'

"There is an ancient poem, entitled 'La Mandrinade,' dedicated to 'the Man of the Rock, a valiant captain and sentinel, day and night, for many ages, upon the rock of Lyons, in the quarter of Bourgneuf.'

"From all these testimonies," says the Revue du Lyonnais, "it is impossible to doubt, that it was to the memory of Jean Kleberger that our ancestors erected upon the picturesque rock, which served as a pedestal, the simple statue of wood, which was renewed from time to time, and always by the working class, whose pious gratitude thus perpetuated the tradition of the benevolence which he exercised among the inhabitants of Bourgneuf."

JOHN KLEBERGER.—STATUE IN STONE, INAUGURATED AT LYONS, SEP. 19, 1849.

BEYROUT.

Beyrout, called by some travellers Beyrouth, Bairout, or Bayruth, is a city of Turkey in Asia, in Syria, in the pachalic of Acre, within twenty-five leagues of that place, and distant twenty leagues from Damascus. Beyrout is the ancient Berytus, the beginning of which history has almost lost in the night of time. So long ago was this old city built, that its origin is enveloped in fable, and the mythologists declare Saturn to have been its founder, and to be the first who made it a place of habitation. Strabo, Pliny, Ptolemy, and others of the ancient writers, record the wonders of Berytus.

The name is supposed to be derived, by some, from the Phœnician idol Baal-Berith, a temple in whose honour was erected on this spot. Others, on the contrary, suppose the word to have originated in the salubrity of the locality, owing to the abundant supply of water which is there to be found. In the Phœnician language it signifies a well.

The old town was destroyed by Diodotus Tryphon, but after the conquest of Syria by the Romans it was rebuilt near the site of the ancient city.

Historians who eschew the mythological origin tell us that Berytus was a colony of Sidon (the modern Saida), and the fatherland of that celebrated historian of Phœnicia, Sanchoniathon, who lived, according to some writers, among which Porphyry is numbered, in the days of Semiramis, and, according to others, in the times of Gideon, the judge of Israel, twelve hundred and forty-five years before the commencement of the Christian era. In Berytus, it is said, the invention of glass was first made, a fact which gives additional interest to the spot. The Emperor Augustus in later days made it a Roman colony, and called it Julia Felix—the name Julia in honour of his daughter, and the epithet *Felix* (happy) to express his admiration of the fertility of the neighbourhood, the incomparable climate, and the magnificence of the situation. Medals were afterwards struck in honour of the Roman emperors bearing the legend, "Colonia Felix Berytus." Herod the Great held at Berytus a solemn court of judicature, at which he condemned to death his two sons, Alexander and Aristobulus, on a charge of treason. At Berytus, also, Agrippa, the grandson of Herod the Great, built a theatre, an amphitheatre, and baths, and instituted a variety of games, which made the place notorious. When Jerusalem had fallen before the Roman soldiers, Titus celebrated, at Berytus, the birthday of his father, Vespasian. But the place was famous for other things besides its stately theatre, or the grand revels which were held there: it was famous for the study of the law. Alexander Severus had founded a celebrated school there. Justinian called it the "nurse of the law," and would permit no other professors to expound Roman justice but such as had been educated at Rome, Constantinople, or Berytus. Berytus was one of the fairest cities of Phœnicia, celebrated all over the East for its civil government, and counted as a very school and pattern for other cities. There happened at

BEYROUT, AND THE MOUNTAINS OF LEBANON.

Berytus, in the year of grace 556, a terrible earthquake; in 1109, the city sustained a memorable siege against Baldwin, king of Jerusalem, who took the place from the Saracens; and in 1187 was besieged again, this time by the redoubtable Saladin, sultan of Egypt and Syria. Three-quarters of an hour's ride from Beyrout may still be seen the stately pines, from some of which the Saracens constructed their besieging apparatus, and which proved too strong and powerful for Christian chivalry. Until the time of Saladin, the good knights of Christendom had successfully defied the crescent; but his military skill and daring overcame them at Beyrout, and Moslems rejoiced in the streets of the city. In 1197, the crusaders and the Mahommedans fought a hard fight between Tyre and Sidon, and victory was declared on the side of the cross. When the people of Beyrout heard that the Christians were marching down upon the city, and that Makel Adel and his troops had been defeated, they fled from their homes, and the conquerors found the city well supplied with provisions, arms, and other military stores, and not one follower of the Prophet to dispute the spoil! Thus changing hands between the Turks and Christians, Beyrout was the scene of many a defeat and many a victory in crusading times. It is the scene of the fabled encounter between St. George and the dragon, and the glorious triumph of the saint over the beast. The last struggle came; the glory of the crusaders was over; and the Christian lords of Beyrout had to submit to their destiny.

> "The knights are dust,
> Their swords are rust,
> Their souls are with the saints we trust."

Christian rule in Beyrout ended in the year 1291; after that period the city was under the domination of the Emirs. One of the most celebrated of these was the Emir Fakhr-Eddin, who made it the capital of his dominions and his own favourite residence. This prince undertook a journey to Italy, and continued for nine years at the court of the Medici at Florence, studying the fine arts, particularly architecture. When he returned to his own country, he built a splendid palace at Beyrout, the remains of which are still to be seen; but alas! his cultivated taste brought swift destruction on him. The sultan, jealous of his power and renown, commissioned another petty prince to dispossess the Emir of his dominions, and to bring him prisoner to Stamboul. It was a hard struggle for the unfortunate Emir to obtain even the privilege of being allowed to live; and when, a short time afterwards, his grandchildren raised a revolt, even this favour was taken away, and the poor Emir lost his head, which was exposed to the public gaze, and left to rot and blacken in the sun, with this inscription under it, "The head of the rebel, Fakhr-Eddin." The dominions once belonging to the unfortunate Emir were now made over to another lord, of a noble Arabian family, dwelling at Mecca, in which family the authority has continued to be invested to the present time; and the family tree taking deep root in Beyrout, numbers no less than two hundred and fifty Emirs.

In 1783, Djezzar Pacha, the same who, a few years later, defended with great tact and success Saint Jean d'Acre against the French army, returned to Beyrout, and made that place a Turkish garrison. When Ibrahim Pacha, at the end of 1831, invaded Syria, Emir Beschir did not attempt to resist him. Beyrout, Jaffa, Acre, Tripoli, were abandoned; but the Arabs relate a curious incident which occurred as Ibrahim was about to enter Beyrout. At a short distance from the gate, as the Pacha was traversing a cross-road, an enormous serpent uncoiled itself directly in his path, and as his horse approached, prepared for the fatal dart. The attendants shrieked and retreated in alarm, the horse reared frightfully, the only man unconcerned was the Pacha, who, drawing his sabre from its sheath, struck at the reptile, and, with one well-aimed blow, cut off its head! Then, without a word, he continued his route and rode into the streets of the old city.

Beyrout possesses, from its commercial character, an air of greater bustle and activity than any other town in Syria. The situation, on the borders of the sea and in close proximity to Lebanon, renders it exceedingly beautiful. Near the gate there is a small eminence from which a commanding prospect may be obtained; a panorama of unequalled grandeur presents itself to the eye. There, in all their magnificence, rise the hills of Lebanon; to the east there is a low, long promontory, on the end of which are situated the Lazaretto buildings, near which vessels ride at anchor in the roads; and all round the town are richly wooded environs, dotted with villas and the rural residences of merchants. A Genoese wall surrounds the town itself, but this is of no great strength; the harbour is commanded by an old fortress, which is in a ruinous condition. There is a small pier for loading boats. The roads are so exposed that, when it comes on to blow, ships generally make for the mouth of Naler-el-Kelb, or the Dog River, where they are more securely sheltered. There are still remaining some curious old fragments of the ancient city; a half-circular ruin, supposed to be the amphitheatre of Agrippa, part of an aqueduct, and traces of the Roman baths, are the principal.

The population of Beyrout is composed of Maronites, Greek Catholics, and Arab Mussulmen, numbering in all about 10,000 souls. There are several British and Continental mercantile houses. Near the bay is the residence of the British Consul, and not far distant is the house of the American Consul. The Mahommedans have lost much of their fanaticism, and are more disposed to be tolerant than they were in days gone by—perhaps it may be that Christians have likewise grown more tolerant; but, however this may be, men of all faiths are allowed to worship without danger in the city of Beyrout. There are representatives of the Greek church, and the Maronite church, a Protestant congregation, a Jewish assembly, and a host of Druses and Mussulmen. The Christians have four churches, and the Mahommedans three beautiful mosques, with minarets, courts, and fountains. In the very centre of the city is the Grand Mosque, and, hard by, an ancient church dedicated to St. John, and ornamented with a Gothic colonnade. The French have a small chapel and convent of Capuchins, in the garden of which six Englishmen lie buried. They died of wounds received in the siege of St. Jean d'Acre, in 1799; so, to the English traveller, this Capuchin garden becomes a place of pilgrimage.

Several American missionaries have taken up their residence in the environs of Beyrout, and by their unpretending labours are accomplishing great good, distributing, by means of schools and a printing-press of their own, a great deal of religious and general information. Every Sunday, divine service is conducted in the Presbyterian form at the American Consulate.

The usual characteristics of eastern cities are to be found in Beyrout, such as narrow streets rendered almost impassable by camels, asses, mules, and crowds of busy and idle people—the same sort of shops, and stores, and way of doing business; but the whole neighbourhood is remarkable for its beauty and fertility. The entire country is richly wooded, the mountains being covered with vines and olives in terraces, and watered by small canals or streamlets. Dehr el Kamer, where the Emir dwells, occupies the side of a hill, and the palace is a very splendid building.

The Druses, who form a large majority not only of the population of Beyrout but of the surrounding country, are a wild, ungovernable race of people. They are equally opposed to Turk and Christian; they stand alone in the world. There is a strange mystery hanging over their domestic life, internal government, and especially over their faith. From some of their books it appears that they worship Flakem Bamri, the fifth of the Fatimite Caliphs. One peculiar portion of the people is set apart for the ministration of religious rites, as the tribe of Levi is distinguished among the Jews. They are initiated into the mysteries of the faith; but respecting these mysteries the great mass of the people remain in entire ignorance. The Druses are a race quite distinct from the other Arabian tribes; some, indeed, suppose them to be the descendants of those armies of vast European hordes which formed the Great Christian Crusade.

RATISBON.

Ratisbon (in German, *Regensburg*), in the kingdom of Bavaria, is situated at the confluence of the Regen and the Danube, in the midst of a very picturesque and fertile country. It is now the chief town of the circle of the Regen. It is one of the most ancient cities of the Upper Danube. Under the Romans it bore the name of *Reginum*, or *Castra Regina;* the emperor Tiberius stationed his fourth legion there, whence it took the name of *Tiberia Quadrata;* in the Latin of the middle ages it was called by a sort of surname, *Ratisbona* (good raft or vessel?). We shall not stop to devote much attention to the tradition which carries back its foundation to the arrival of a certain Bavaro from Armenia, who established a colony here, and whose descendants were conquered by Norix, son of Hercules. These are fables with which credible history has little or nothing to do. The inhabitants were converted to Christianity about the year A.D. 185; but the first bishop was established there in the eighth century by St. Boniface. In later times, Ratisbon became a free city *(Freistadt)*, and made great advances. The conflagration which took place there in 1046, and almost entirely consumed it, only checked its commercial activity for a brief season. In fact, this city was, during the middle ages, one of the most important commercial towns in Germany. It corresponded with Venice, which sent it commodities from the East, and received furs in exchange. It is even said to have had commercial transactions with Kiew in Russia. Thus it was the rival of the neighbouring industrial city, Nuremberg. The crusaders, in order to reach Asia, had recourse to the boatmen of Ratisbon, who maintained a high reputation for several centuries, till the discovery of a new route to the East Indies, and of a continent in the west, previously unknown, gave commerce a new direction.

Ratisbon never recovered from the blow then inflicted upon its prosperity, though the diet of the empire has long held its sittings within its walls and given it a sort of *éclat*. It is still a busy city, without doubt, but is no longer the flourishing Ratisbon of former days. The present population is 25,000. The town, surrounded by the remains of ancient fortifications and a wide and deep ditch, has irregular, narrow, dark, and ill-paved streets. The houses with which they are lined give evidence of a remote antiquity. From time to time you perceive near the dwellings of the citizens massive Gothic towers, the last vestiges of a period in which the citizens of Ratisbon withdrew behind thick walls to defend themselves against enemies as well as their fellow-citizens. Among these monuments of a barbarous civilisation may be discerned the Golden Tower (*der Goldene Thurm*) and the Goliah, a kind of fortress, on the front of which is represented the combat of David and the giant Goliah. But the principal edifice in Ratisbon is the cathedral of St. Peter, one of the *chefs-d'œuvre* of German architecture.

After the disastrous conflagration to which we have already alluded, a new church was built, the first stone of which was laid by the bishop Leo Thundorfer, patrician of Ratisbon. In the seventeenth century, the works were not yet finished, and even now two towers remain incomplete. In a chronicle of Nuremberg, dated 1493, these towers of the cathedral are represented as surmounted by a crane, like that of Cologne at the present time.

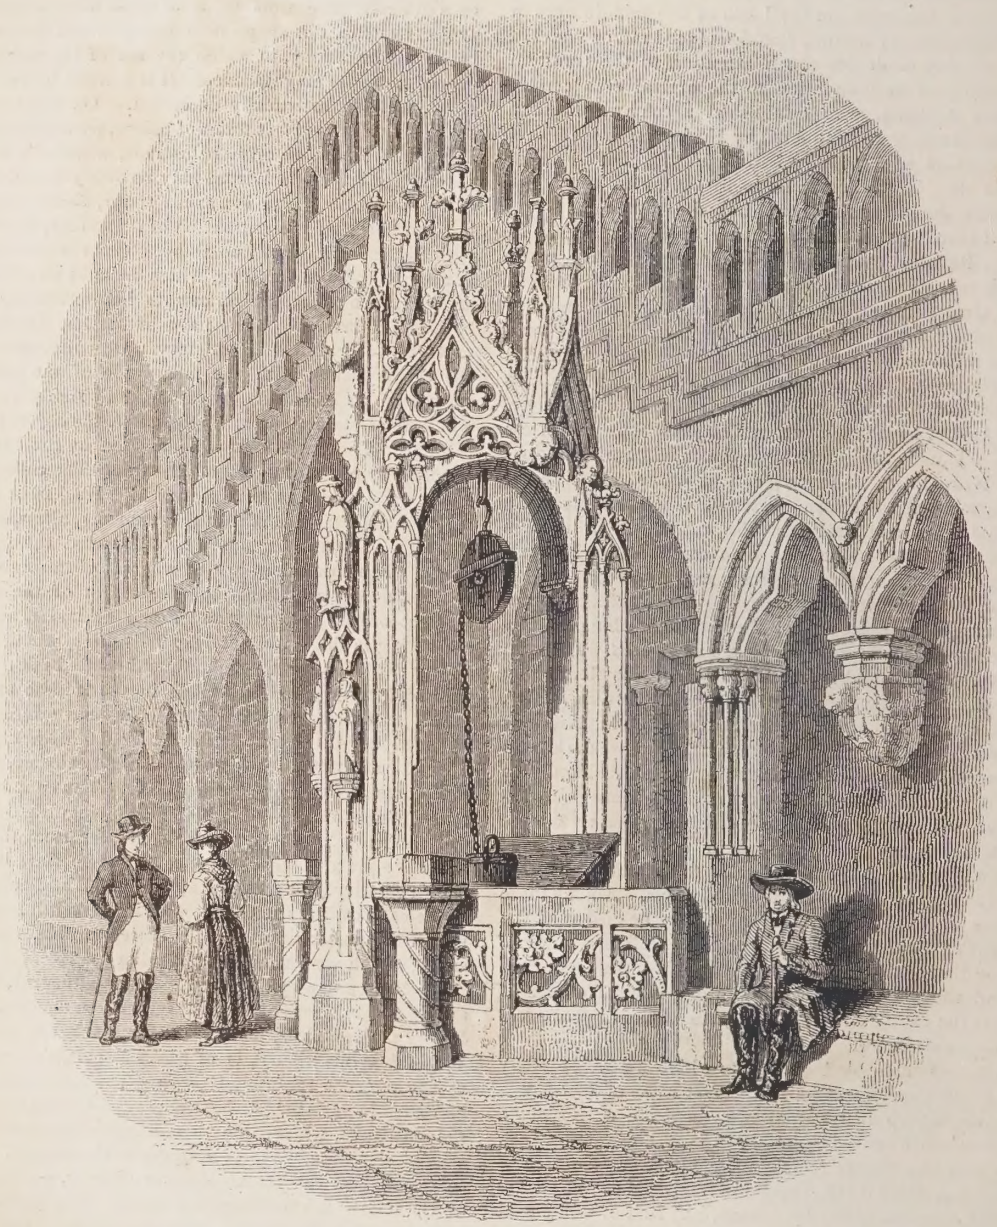
The present cathedral, which, as we have observed, is the chief object of interest in Ratisbon, is as remarkable for the good taste of its internal ornamentation as for the imposing majesty of its exterior. Altogether it is considered one of the finest Gothic churches of which Germany can boast, whence the reader may infer that it possesses no ordinary attractions as a specimen of mediæval architecture. It was commenced in the year 1275, and it continued building down to the early part of the sixteenth century, or about two centuries and a quarter. But it is still in an unfinished state. The original architect was Andrew Egl. Having been so long in course of erection, it is not surprising that it exhibits a want of perfect harmony in the style of its construction. Hence, in the west front we recognise the decorated style of the fifteenth century, while part of the east reminds one of the early English style. The towers of the west front are not completed, but even in its present state this part of the building commands great attention. It exhibits noble proportions, and ornaments are lavished upon it without overburdening it. The large entrance door, represented in our illustration (p. 277), is built on a different plan from those of most other cathedrals. It projects out in the shape of a triangle, and forms a sort of baldaquin or canopy, in which the art of the sculptor is displayed in all its magnificence. It is flanked by two accessory doors, not less artistically decorated. On the two sides of the building is a perfect forest of pillars, pyramids, and turrets, above which runs an open balustrade, whence a magnificent view of the city and environs may be obtained. On the north of the cathedral there is a small tower, *Eselsthurm*, so called because, during the construction of the edifice, the asses laden with the materials went up there. There is some peculiarity in the plan of the building, which is built after the model of an ancient basilica, the transepts not extending in length beyond the breadth of the nave and aisles. There are transepts, however, in the upper story. On entering the building, the eye is struck with the magnitude of the pointed arch supported on each side by pillars, and richly adorned with windows of stained glass, which soften the light as it streams through. These windows were painted by the first artists of Munich, by order of Louis of Bavaria. The cathedral of St. Peter owes much to that monarch. He had it completely restored and stripped of all the ornaments, altars, statues, and tombs, which were out of taste and marred the general harmony. The chief altar, which was all glittering with silver, did not accord well with the decoration of the church, on account of its modern form; hence he had it adorned with a covering in the Gothic style. This altar, which is of beautifully chased silver throughout, and at the back of which is a well-sculptured crucifix, stands in the middle of the choir, which is a hundred feet long. The nave measures three hundred feet in length, and a hundred and twenty in height. The altars in the aisles have not been neglected, but exhibit sculptures of exquisite workmanship. Thus a most beautiful statue of the Virgin—a work of art distinguished by singular merit—stands in the north aisle not far from the west end. It is thought to have been executed some time in the fourteenth century. One of the most original and curious objects in the cathedral is the Gothic well in the south transept, from which the water necessary for sacred purposes is obtained, and of which we furnish an engraving (p. 276).

Several tombs may be observed in the cathedral at Ratisbon; among others, those of Count Herberstein and Prince Charles Dalberg. This last, which is very near the statue of the Virgin just mentioned, is of white marble, and was designed by the eminent sculptor, Canova. The monument to Count Herberstein has a marble bas-relief representing Christ feeding the multitude, which, though wanting in freedom and ease, is a very elaborate piece of minute workmanship. Formerly that of Albert the Great, *Albertus Magnus*,—a famous doctor of the thirteenth century, too much of a philosopher not to be accused of sorcery—was also to be seen there. It was pretended that he had the gift of omnipresence, and that at the same moment in which he was instructing his pupils in theology from his chair, now preserved in the chapel of the Dominican convent, he was seen sitting in his study at Donaustauf, a small town situated about twelve miles from Ratisbon. Hence his tomb has been removed to the Dominican chapel. Another sorcerer (according to the superstition of the common people), the celebrated astronomer, John Kepler, lies buried at Ratisbon, where he died on the 15th of November, 1630. A monument, adorned with his bust and a magnificent bas-relief, executed by Dannecker, is erected to his memory in the public promenade which bears the simple title of The Walk. The traditional story of Kepler's having

died of hunger is not strictly correct: he sank under the vexation and opposition which harassed him during the latter part of his life.

Near the cathedral is the cloister which forms part of it, and in which there is a crowd of monuments, sarcophagi, busts, and statues, belonging to the Roman and middle ages. A door in this cloister leads to what is called the old cathedral (*der alte Dom*), in which stands a pagan altar, in stone, which was probably used for the delivery of oracles.

stables, a riding-school, a Gothic chapel with a figure of Christ, by Dannecker, and a family vault in the Byzantine style. Not far hence may be discerned, mouldering with age, the walls of the Hotel de Ville, which was the seat of the Diet of the German empire from the year 1663 to the commencement of the present century. The representatives of the different states assembled for deliberation in a large hall, where the imperial chair is still preserved. The vaults of this building are curious to traverse; they were formerly prisons and places



GOTHIC WELL IN RATISBON CATHEDRAL.

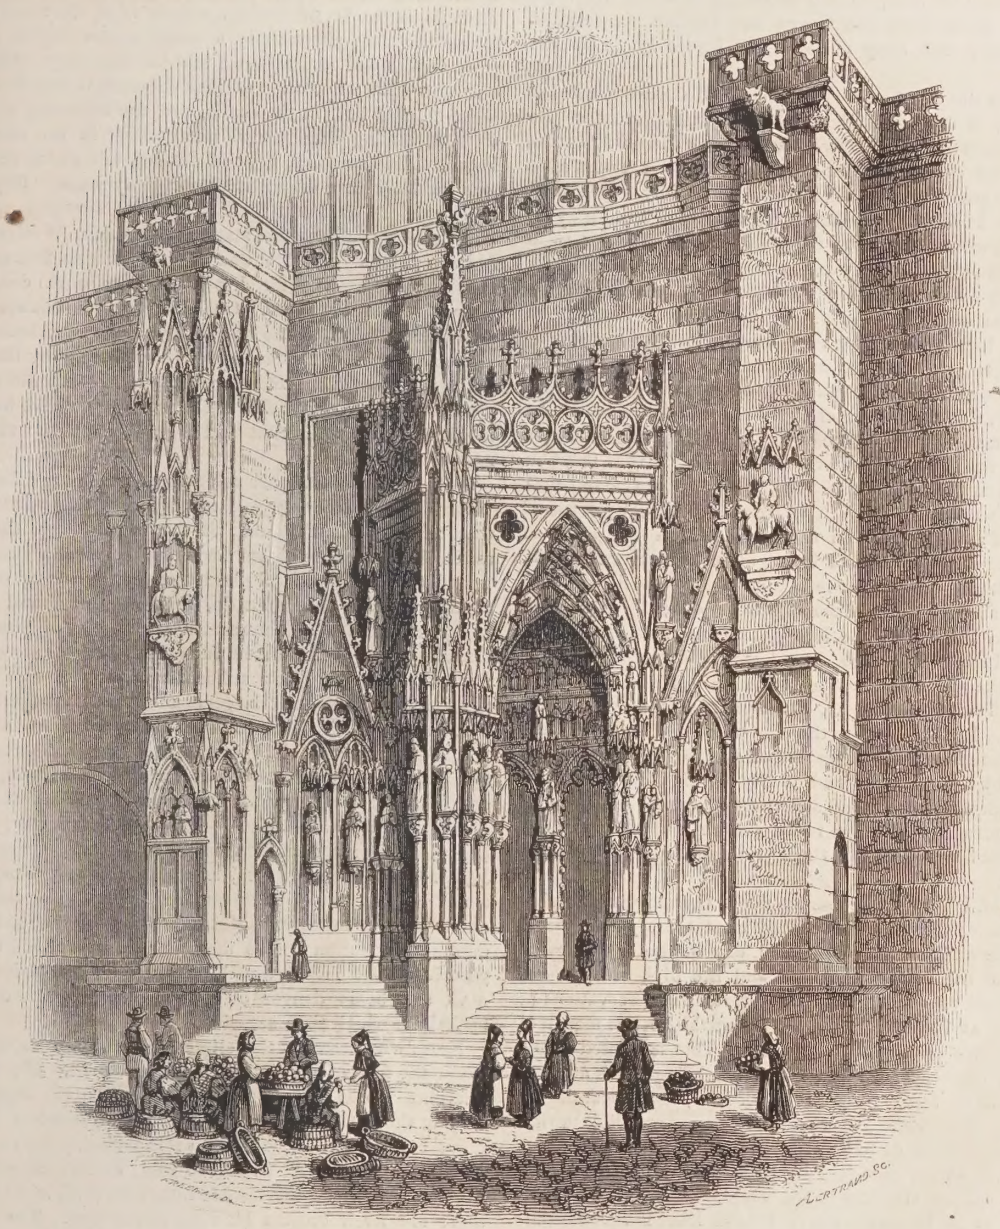
St. Peter's is not the only building at Ratisbon which is worth visiting. The old parish church of St. Ulrich, the Benedictine convent of St. James, the church of St. Emmeran, and the palace of the princes of Tour and Taxis on the site of an ancient abbey, are all objects deserving of attention. The princely family last mentioned has for a long time held the postage of the whole of Germany on lease, which has contributed largely to its wealth. The palace is adorned with great luxury; above the entrance door Schwanthaler has sculptured some magisterial figures; inside there are some excellent

of torture; the instruments of torture employed by the barbarous legislation of the middle ages hang all along the walls. A projecting house, opposite the Hotel de Ville, attracts attention on account of two paintings on the walls, representing the struggle of a warrior of Ratisbon with the giant Krako, in the reign of Henry the Birdcatcher. The defeat of the monster gave birth to a simple song, the family of the victor, Dollinger, was ennobled, and the spot on which the combat occurred received the name of the Heathen Place (*Heideplatz*).

The stone bridge over the Danube, built in the twelfth

century, was a marvel of the age in which it was constructed; but its arches are not wide enough for the boats that now navigate the river, and the consequence is, that accidents not unfrequently occur. But this ought not to excite any astonishment; for his Satanic majesty, we are told, has passed by there. The architect of the bridge, who had invoked his aid by promising him the soul of the first crosser, played him a well-known scurvy trick. He made a dog cross the bridge, and the evil one, in his rage, cut off the poor creature's head. Hence the figure of a dog without a head, which is to be seen on the balustrade.

Another circumstance which gives an interest to Ratisbon is the fact that near it was fought the celebrated battle of Eckmühl, in which the French conquered the Austrian forces.



DOORWAY OF RATISBON CATHEDRAL.

A FEW WORDS FROM AUSTRALIA.

BY WILLIAM HOWITT.

McIvor Diggings, Victoria, July 1, 1853.

This winter we have travelled up to the *new* diggings. Great was their fame when we were in Melbourne. Wonderful were the accounts of large nuggets, and large fortunes being found. We have arrived, and again find it all moonshine. A rush of diggers from Bendigo, of upwards of a thousand per day, was the consequence of these grand rumours; three miles of ground have been turned up to find next to nothing. The Bendigo men have hastened back again, and troops of others are from day to day following them. This is the constant experience; such are the diggings. But to give some idea of what *getting* to these diggings is, it is only necessary to state, that this distance of seventy-five miles has cost us *six weeks* to accomplish! or about two miles a day on the average, bringing up a load of little more than a ton. The roads we found still more frightful than those to the Ovens. They are such, that the iron axle of our cart has been broken *four* times, and has cost us £13 in repairing it. Nor have we been singular in this respect. All along the road has been

the spectacle of carts and bullock-drays, bogged or broken down by the way-side. These bullock-drays are drawn by twelve, sixteen, and twenty bullocks each, yet they are constantly sticking fast or breaking down, and occasion delays of a week and a fortnight at a time. The whole road was again strewn with dead horses and oxen. In fact, no one who has not seen it can conceive anything of the enormous labour and waste of animal life and property in getting up to the diggings. In coming down from the Ovens last autumn, we counted between thirty and forty bullocks and horses lying by the way.

Then as to the weather, we are told by all the accounts that I have seen, of the paradoxical nature of this climate, of the winter without ice and snow. My brother Richard, in his account of the colony,* by far the most faithful account of it that I have ever seen, was vehemently accused by the colonial papers with having stated that there was such a thing as ice there in the winter, and he so far qualified his statement as to say that there was none on pools or creeks (brooks). Now on this journey I have seen more snow than I have seen in England for the last three years. One day, near Kilmore, it snowed as heavily as I ever remember it to have snowed in England, from eight o'clock in the morning till three o'clock in the afternoon. It was then three inches deep, and the settlers said, that in the gullies of the neighbouring mountains it was in many places three feet deep. The snow lay so heavily on the trees, which are all evergreens, that it broke them down like carrots. As for ice, we have had severe frosts for a week together, the ice in the morning being upwards of a quarter of an inch thick on the pools and the still places of the creeks. In our buckets it was often half an inch thick, in our washhand-basin the ice was frequently a solid mass of more than an inch thick from one night's frost. It is true that the sun in this latitude has so much power that the frost has never, in our experience, lasted through the day; on the contrary, the days are warm and fine, often for a week together. To-day, as I write, the thermometer stands at 70° in our tent. Indeed, we like the winter season much the best. Though there is often very severe cold at night, *that* we can keep out by a good tent, and plenty of blankets and rugs. And though we have a rapid alternation frequently of roaring winds, fogs, and drenching rains, yet we are at this season free from the fierce heats and the myriads of tormenting insects of summer.

As to heat, I have not yet seen a single thermometrical table of this country which has not been most grossly inaccurate. Refer to the work of Mr. Westgarth, one of the most careful statitians of the colony, and you find the highest degree of summer heat, as quoted from the government observations at Melbourne, at 73·48, in January, about the hottest month of the year, corresponding with our July. That is quoted as the hottest day of the year, the observation being taken at 2·30, P.M. While in June, the mid-winter here, the lowest degree was 46·96. The intermediate months range, according to that table, at about from 55 to 68 degrees.

Now from this you would conclude that Port Philip was one of the mildest climates in the world. It could not even be so hot as in England, where I have known the thermometer stand at 110° in summer; and *it could never possibly freeze*, for the thermometer, according to this table, never descends to 42°. Nay, Mr. Westgarth, speaking of the hot winds which visit this country in summer, actually shrivelling up the corn into tinder, says, "At Melbourne they commonly last for two or three days at a time, with a temperature of from 80° to 90° in the shade, ascending sometimes, though rarely, as high as 100°. In the Sydney district they blow with greater severity, and are more apt to injure or destroy the crop."—p. 37. Mr. Westgarth again gives a table of the government observations taken at Adelaide, which states the highest degree of heat occurring on a summer day, at noon, as 106½°; the lowest, in June, as 47½°. So that nobody in Adelaide, if the government can be relied on, need suffer any excess of heat in summer, nor fear such a thing as frost in winter. But here, as at home, the weather is neither regulated by act of government, nor act of parliament, but by the act of God; and people are therefore much surprised, in this country, to find themselves in summer broiling under a sun shedding a heat of 139° and more in the sun, and freezing them in winter at about 26° or 28°. Last summer, amongst the hills in the Ovens district, not far from the Snowy Mountains—therefore notoriously a much cooler region than the plains and lower country—we had the heat very commonly in our tent 120° at noon. On one occasion it stood at 139° in the sun, and 120° in the shade, and the following night sank to 40°; having thus varied nearly 100° in the twenty-four hours. This summer, the inhabitants tell us, is the coolest summer they have experienced for many years. If you refer to the works of Count Strzelecke and Montgomery Martin, they give you the same statements as Mr. Westgarth, and drawn, probably, from the same sources. As I have said, in winter the thermometer has frequently sunk considerably below the freezing point. On Wednesday last it stood at 31° at sunrise. Perhaps the inaccuracy of the government observations may, in a great measure, be explained by their being taken in close-built rooms, and not, as they should be, in the open air. They ought also in the morning to have been taken at sunrise; between that and eight o'clock the rise of the mercury is wonderful.

Now these accounts are as unwise as they are false. If the writers in this colony would not try to give us "better bread than can be made of wheat," if they would leave the country as God and nature have made it, those who come hither would find it a good and pleasant country, instead of feeling, as they almost to a man do, imposed upon, and therefore indignant and full of denunciation. The drawbacks and the climate ought to be stated fully and fairly, as well as the attractions, *e.g.*, the hot, suffocating dust-winds of summer; the countless swarms of insects and reptiles, mosquitoes, flies, ants—many of them an inch long and stinging as badly as wasps—by millions; scorpions, centipedes, poisonous spiders, and venomous serpents. The latter of these vermin, however, are of small consideration in comparison with the "Little Black Devil of Australia"—the small black fly, which is legion. This most pestilent insect is as numerous as it was in Egypt during the plagues there. It gives you no rest for about five months of the year, and is, in truth, the greatest curse of the country. Mosquitoes, however bad, do not deserve a mention beside them. You are obliged to envelop your head and face in a veil, or you would be driven almost mad, and be in danger of being blinded by the envenomed opthalmia which they occasion.

Those who describe the climate should tell us, too, of the rains, the frosts, the violent winds of winter; and then poor wretches would not attempt to walk up to the diggings with only a single blanket or rug to wrap themselves in on the ground at night, and to walk as in noonday for two or three days at a time. Still, as I have said, we like the winter best. The air is then, at considerable intervals, mild and temperate, there are fresh breezes blowing about you. The feeling is more that of the climate of England. You have plenty of good water running in the creeks, and are exempt from the intolerable plague of flies, and the broiling oppression of perfectly tropical heat.

Let me now say something of the modes of getting up to the diggings. These are chiefly three. The first is to engage a bullock-dray for a whole party, to carry up your tent and effects. Bullock-drays are the most certain, and in many cases the only vehicles that can make their way through the bogs and deep miry roads. With twelve or sixteen bullocks they seem to stick at nothing, but go on steadily but surely through places that are impassable to horses. Yet even these are not proof against the difficulties of the journey. They are seen, ever and anon, sticking fast up to the axles; their wheels and poles, though massy, smashed to atoms; their ponderous iron axles snapped like glass; and their cattle with the

* "Impressions of Australia Felix," by Richard Howitt.—Bohn: London.

CHURCH OF NOTRE DAME DE L'EPINE, DEPARTMENT OF MARNE, FRANCE.

NOTRE DAME DE L'EPINE, CHALONS, FRANCE.

The beautiful edifice which bears the title of *Our Lady of the Thorn*, is situated at about five miles distance from Chalons-sur-Marne, and its strange old architecture forms a strikingly picturesque object in the scene, more like some luxuriant tropical plant than a mass of stone. The legend connected with its origin is quickly told. In 1419 there stood upon that very spot a little chapel, surrounded by trees, and dedicated to St. John the Baptist. One night, as the story goes, when the shepherds were returning with their flocks from the neighbouring pastures, a bright light shone upon them; the sheep were terrified, and shrank away, but the lambs made straight for the holy place. It was the Feast of the Assumption. The shepherds, in surprise, followed the lambs, and lo, in the centre of the bright glory, they beheld an image of the Virgin holding the infant Jesus in her arms. As the night went on, the light grew brighter, and for miles and miles away was noticed with amazement.

So the priests of Meletto and the Bishop of Chalons, as soon as they heard of the occurrence, hastened to the spot, and among the thorn bushes outside the chapel of the Baptist, they discovered a small stone image of the Virgin; this they conducted with great pomp into the sacred building; and from that time the chapel became a place of great resort; there the richest offerings were presented, and at length Charles VI., of France, granted his royal letters patent for the erection of a church—a building, say the chroniclers, in every way befitting the miraculous appearance it was designed to commemorate.

At that period, a great part of France was under English rule. It was not then an idle boast when British sovereigns quartered with their arms the lily of St. Louis. The period was not far removed from the days of Joan of Arc. An English architect, whose name was Patrick, was employed to erect the new church, and under his direction the work proceeded with great rapidity. The façade, the nave, and the chief tower were soon completed, but the fortune of war gave that part of the country into the hands of the French, and the English being compelled to retreat, the architect took flight, and, alas! for the beautiful structure, carried off with him the funds intended for its completion.

Antoine Guichard proceeded, after some delay, with the work, and under his direction the church was rendered still more beautiful than any one had anticipated. They had resigned the work into Guichard's hands, rather than employed him to carry out the design of his predecessor; but the new architect modified the old plans, and by those modifications considerably improved them. In 1529 the church was finished. Nothing could exceed the enthusiasm of the people; the altar was crowded with costly gifts, the people of Verdun and Chalons gave a splendid window of stained glass—a window, by the way, which the fortune of war completely shattered a short time afterwards.

In the Revolution of 1789, five of the bells were melted down and converted into money, and one of the stately towers deprived of its spire, and turned to new account by being made the station of the telegraph. In 1825 it sustained some accidental damage, but this was speedily repaired.

THE DEAD BRIDAL.

CHAPTER XVII.

All the world knows, that during the summer months of the year, an Italian city presents at the hour of noon an appearance of repose and desertion that, but for the bright sunshine and the open doors of shops, might make one almost fancy that it was night. The *jalousies* of all the windows are closed; no bright eye looks from the casements; no light foot trips from the threshold; no fair form glides along the strada or piazza; nobody—except, indeed, those insignificant bodies that society always most properly considers as nobodies — we mean mechanics and labourers, or such like folk—is to be seen abroad; and even they look drowsy and dreamy, as if they would be much better employed in doing nothing, like their betters. And what are their betters doing at this hour? Why they are sleeping—aye, sleeping, while the sun's rays are at the hottest, and the day is in its meridian glory. Strange as this sight may appear to a denizen of our more northern latitudes, when first he enters a town of southern Italy, yet he very soon learns not only to cease to wonder at it, but often to shut his eyes upon it altogether—that is, he too finds it a very pleasant thing to go to sleep just like his neighbours. And, indeed, it must be admitted that the southerns earn the right to this short repose by the habit of rising in the morning with the sun—under the delusion, it may be, that the night is then over—and being astir hours before the fashionables of Britain have awakened from their first sleep, and turned themselves upon the other side for their second slumber. If this be the custom in Italy, in our own days, so was it five hundred years ago, and especially in the fair city of Venice, than which—notwithstanding that she reclines, as it were, floating on the waters—a hotter spot cannot be found on a summer noontide between the Alps and the Apennines.

And so it was that, on the first day of July, in the year of grace 1380, the city of Saint Mark lay in the repose of its mid-day slumber. And yet to any eye that was waking and exercising its function of vision, it must have been manifest that during the morning an unwonted amount of bustle and preparation for some approaching event had prevailed. Workmen might be seen occupied in erecting scaffolding in the principal piazzas and thoroughfares of the city, upon which benches were placed for spectators. Flags and draperies of cloth and silk, of the most brilliant hues and costliest texture, hung out of balconies; the canals were thronged with barges and gondolas, decked with streamers and ribbons and boughs of laurel, while the gondoliers lay sleeping upon the benches. Altogether, the scene was one that presented strikingly to the mind the contrast between excitement and repose—between life and death. You felt as if the Angel of Sleep had suddenly waved his dusky, leaden wings over the city in the midst of her activity, and lulled her into temporary forgetfulness. Amongst the fair lids upon which the balms of the angel had descended, was a very pretty pair which we have already attempted to describe. Their mistress was just at this hour tranquilly reposing in one of the apartments of the Palazzo Polani, whither she and her good old nurse had come from the Villa Morosini, at the summons of her guardian, who had notified his desire that she should be in readiness in the city, with the other daughters and dames of Venice, to receive the triumphant armament upon its return, and grace by their presence the festivities which had been ordered by the state. What the dreams of the young girl were, as she lay in partial *deshabille* upon the couch in that darkened room, where the cool exhalations from a large vase of perfumed water tempered the noontide heat, we shall not take upon us to say: certes, they seemed to be pleasurable, for a smile played upon the slightly parted lips, and a flush spread faintly over the cheek, and now and then a name was breathed in murmuring indistinctness upon the silent air of the chamber. Well, we shall not try to discover whose was that name. Let her sleep on. Life is not so full of unalloyed happiness, that one should be awakened from sleep too soon!

The repose of Bianca was, however, invaded somewhat earlier than was necessary by good Giudetta, who hurried up to her young lady's couch with unusual animation.

"Up, dearest signora, up," cried the old woman; "this is no day to lie a-dreaming. Here has been my young lord's serving man Tomaso an hour since. He has come all the way from Chioggia this morning, and brings such news."

The maiden arose from her midday rest, and as she disposed herself for the toilette the old woman continued her narration.

"By my faith, dear child, the wars have not done much to improve that same saucy valet, as he calls himself. Heaven knows he was forward enough when he came from his travels; but now he swaggers and ruffles about just as if he was ready to cut any one's throat that would look askaunt at him. The Virgin grant that the camp has not done as much for the young count Giulio."

Bianca smiled.

"We must hope, Giudetta, that the head of the master may not be so easily turned as that of the man; but thy news, good nurse."

"Oh, aye, signora; what a head I have to be sure. Well, Tomaso says, that his serene highness the doge, with all the captains and great warriors, were to leave Chioggia at day-break, and go in their galleys as far as Malamocco. It seems that a vessel has been sent thither by the state to receive him and his suite, and in this they are all to proceed in great pomp as far as San Chimento. And then, my dearest lady, the grandest part of the day is to commence, for the state has ordered the Bucentoro to be refitted and turned out in great splendour; and it is to be rowed down to San Chimento; and they say that half Venice are preparing to go forth to meet his highness, and to conduct him back again to the city with all sorts of triumphs and rejoicings, and I know not what. Santissima Madre! but it will be a great day in Venice, I trow."

A great day for Venice, assuredly was this first of July. How changed were her fortunes since, just six months before, her nobles and citizens had last assembled in her piazza, going forth to do battle for their very existence then, now returning victorious, the Gonfalon of St. Mark still flying proudly, holding the unvanquished supremacy of the sea. All was bustle, excitement, and preparation throughout the city, the work proceeded vigorously through the day, and ere four o'clock everything was completed for the triumphal entry of the doge and the Venetian troops. And now the crowds grew denser in the great square and the piazzetta, every calee seemed to send forth a stream of life into the great thoroughfares; every house poured out its inhabitants, and the throng was so great that Sanuto assures us one could scarcely pass through the piazza. The windows and balconies of all the palazzi and buildings which grace the grand canal or the squares of Saint Marco, were filled with fair and richly attired women, and were hung with gorgeous draperies of cloth of every hue and texture, the effect of which was brilliant and picturesque in the extreme. At length, any one who looked along the sea of heads might perceive a simultaneous movement to and fro, while every countenance was intently turned in the direction of the water; then was heard a suppressed yet excited murmur of voices as, at last, the flotilla of the republic hove in sight. Strains of martial music came borne along the quiet air, and the sunshine fell upon the pennons and streamers of the galleys, and glinted off the gilded sides of the state vessel and the bright armour and weapons of the troops. And now they move on slowly and majestically through the water, making for the stairs at the foot of the red columns. First came the world-famed galley of the state, "il nobilissimo e gran vascello Bucentoro," as it was magniloquently designated; and a very grand and noble galley it was indeed, if elaborate workmanship and costly decoration, rather than utility, constitute grandeur. A British traveller, who saw it in the days of its glory, in the commencement of the seventeenth century, declares that "it is a thing of maruailous worth, the richest gallie of all the world; for it cost one hundred thousand crownes, which is thirty thousand pounds sterling. A work so exceeding glorious, that I never heard or read of the like in any place of the world, these only excepted, viz. that of Cleopatra, which she so exceeding sumptuously adorned with cables of silke and other passing beautiful ornaments; and those that the Emperor Caligula built with timber of ceder and poupes and sternes of iuorie; and, lastly," he adds, we suspect with more loyalty than truth, "that most incomparable and peereless ship of our Gracious Prince, called the Prince Royall, which was launched at Wollige, about Michaelmas last, which indeed doth by many degrees surpass this Bucentoro of Venice, and any ship else, I believe, in Christendome." The size of the Bucentaur was, however, not such as will be very imposing to us of an age when Leviathan steam-vessels cross from the New to the Old World in a week; truth obliges us to disclose the fact that its length was but one hundred feet, and its breadth twenty-one; it was driven through the water by forty-two oars, each worked by four men, who sat in the lower deck; above this was the upper deck, covered all over by an arched awning of crimson velvet; the quarter deck was slightly elevated, and near the stern was placed a gilded throne for the doge, while along the length of the vessel ran four rows of benches for the senators and other great personages, who usually accompanied his highness. But how shall we describe the ornaments which crowded this lumbering aquatic-royal-coach with the most lavish prodigality? Near to the doge was a colossal statue of Justice, covered all over with gold, and holding the scales in one hand and the sword in the other. Along the sides were twenty more gilt statues, some of emperors and generals, others allegorical. Then there were marine deities, winged lions, medallions, cornucopias, fruits, flowers, all elaborately carved and richly gilded. The prow was fashioned into a mighty winged lion, which proudly divided the subject waters, while from the mast-head floated the same monster wrought upon the gonfalon of the state. Dear reader, smile not as you read at all this old-world pageantry: if you live in an utilitarian age be thankful; but do not forget that, with all our enlightenment, we have not yet got rid of the puerilities of lord mayors, glass-coaches, and the mummeries of hideous bear-skin hats and civic robes.

On the day of which we write, however, there was no sense of disparagement to qualify the admiration with which a thousand wondering eyes beheld the imperial galley urging her course slowly onward. There sat the noble-hearted old doge, Andrea Contarini, in his golden chair of state, the horned bonnet on his brow, and his venerable white beard flowing down upon his gold-embroidered vesture. At his side were the Bishop di Castello, and the Calonaci di San Marco and le Croci; beyond these were such members of the Council of Ten as had accompanied him to the siege of Chioggia; then came the principal officers of the state, and the senators who had gone to meet the armament as far as San Chimento. On either side of the Bucentoro, and following in her wake, brigantines and skiffs of every shape and description were to be seen; some with the prows shaped in the forms of sea-horses, and other marine monsters; others with the stern elongated into vast tails, but whether of fish or fowl, he would indeed be a bold zoologist who would take upon him to pronounce. But one huge galley engrossed special attention, and even divided the popular admiration with the Bucentaur herself. This vessel was nearly as wide across the beam as she was long from stem to stern, reminding one somewhat of an over-grown punt. The rotundity of its appearance was, however, relieved by two enormous dolphins, which were projected from the prow, and, being made of a shell-work of light wood covered with linen, floated high out of the water, showing their backs covered with golden scales, and being harnessed to the poop, they presented the appearance of drawing the galley through the water. From the deck of this craft rose a superstructure of a very novel character, to be seen floating on the water—nothing less than a lofty circular temple, of Grecian architecture, surrounded by four-and-twenty pillars which supported a hemispherical dome; a pennon floated from the summit, and within sat a number of persons, of both sexes arrayed in gay and fantastic dresses, and wearing masks.

And now the Bucentaur had reached the stairs at the foot of the piazzetta di San Marco. A flourish of martial music burst forth from the clarions; shouts of "Viva la Republic

Serenissima! viva San Marco!" rent the air; while scarfs and kerchiefs were waved from balconies and casements, and bonnets were raised aloft in joyous acclamation. Then the old doge rose from his chair of state, and with the Bishop of Castello on his right, and the principal of the "Neri" on his left, and preceded by the gonfalon, stepped from the Bucentoro, and once more placed his feet within the city of Saint Mark. It was a proud moment for the old warrior. He paused for an instant on the lower step, and raising his sword-hilt with both his hands, he bent down his head till his lips touched the cross formed by the guard; then looking up to heaven, he exclaimed, amidst the profound silence of the multitude,

"Bear witness, O blessed Saint Mark, and ye holy apostles of God, I have kept my vow, and now return in triumph to Venice!"

Then the silence into which the crowd had, as if by magic, been lulled, was broken by a simultaneous cheer, as if from every throat in the concourse,

"Viva il Contarini! Viva lo doge! Viva l'eccellentissimo senato!"

And now the crowd of spectators were pressed back on either side by a company of Venetian halberdiers, who, passing down the centre of the piazzetta, made a clear space for the procession of the various trades of the city, who formed in the prescribed order to meet the doge, and conduct him to the Church of Saint Mark. First came, marching two abreast, the worshipful company of the barber-surgeons, marshalled by their gonfaloniere, bearing the standard of the guild, upon which was displayed the winged lion of Saint Mark, with the motto, *Quid non speremus*—a boastful one truly; but in all ages the professors of the healing art have understood the value of confidence in themselves in order to inspire confidence in others. Next in order followed the guild of goldsmiths; their banner was, as might be expected, extremely rich; it was made of red and blue cloth of silk, embroidered profusely with gold and silver, having the motto wrought in thread of gold, *Nostros non aspernare labores*. Then came the tailors, with their banner of white silk wrought over with leaves of green velvet, with the legend, *Decorum et honestum*. After these was a beautiful flag of azure silk, representing the sky at midnight, studded profusely with stars of silver; the armorial bearings were a virgin holding the shield of Saint Mark in front of the temple of Janus, which was closed, as appeared by the motto, *Clauduntur belli portæ*, intimating that the fine arts flourish best in time of peace: this was the standard of the painters. And so each of the other companies followed in their prescribed order, the merchants bearing on their standard an image of the Virgin, with the legend, *Sub tuum præsidium confugimus*. Then the shoemakers, the glass-blowers, the mirror-makers, the farriers, the swordblade-makers, who bore on their banner a wheel, with the motto, *Ex bello pax*. Then followed the dyers, the silk-mercers, or *toscani*, as they were then called; the carpenters, smiths, masons, and stone-cutters; the bakers, whose flag displayed Ceres crowned with a wreath of corn-blades, and the legend, *Hilarius flavescet*. But as we do not aspire to the office of the herald, we shall omit the rest of the trades, which were, indeed, very numerous in a city where all the arts and manufactures flourished in an extraordinary degree. Let our readers suppose them all to have passed by him in their procession up the piazzetta, and attend to that portion of the pageant which next solicits his admiration. First come the eight standards which were presented to the state; they are of rich cloth of silk, embroidered with gold; two are of white, two of red, two of blue, and two of purple. Then come six trumpeters blowing the six state trumpets made of pure silver; after these followed the *scudieri*, or esquires of the doge, bearing his armour; then one carried the great torch called the *cero*, being made of white wax. Next in procession come the councillors of state, the senators of the Pregadi, arrayed in their gowns of crimson silk with long white sleeves, the two ducal chancellors, the secretaries of the various tribunals, the treasurer, the procurator of St. Mark's and the other officers of the state. Next in order come the *cusino*, or cushion, on the one side, and on the other the *sedia*, or ducal chair, borne on the shoulders of two men, and resembling in form the curule seats of the Romans. Last of all comes the doge himself, preceded by the captain-general, the illustrious Zeno, and the grand chancellor, who though always selected from amongst the citizens took rank above the nobles. Old Andrew Contarini, with his weight of eighty years, bore himself erect and proudly that day, beneath the great state *ombrella*, having on either side of him the Bishop of Castello and the chief of the Council of Three, while after came the sword-bearer with the *stocco*, or sword of state, the procession being closed with a company of ducal guards. In this order the *cortège* proceeded, amidst the acclamations of the people and the sound of martial music, along the piazzetta towards the church of St. Mark. When they had reached the area in front of the cathedral, the members of the various trades separated on either side, leaving a clear space in the middle, and thereupon the canons issued forth from the principal entrance, clothed in their vestments and bearing the cross, while they chanted the "*Te Deum Laudamus*." As soon as they met the doge they turned and conducted him, still chanting the hymn, up the nave of the church and so on to the high altar, where grand mass was performed, and thanksgiving offered up for the successful issue of the war. When the mass was over the procession formed again, and conducted the doge to the ducal palace. The evening was closed with a magnificent illumination. The principal buildings were lighted up brilliantly; the galleys were moored in the canals of the Giudecca and San Marco, and lamps of various-coloured glass were hung along the rigging and the masts, while the Bucentoro was one blaze of splendour, to the great delight of the worthy citizens who paced the southern banks of the city, and filled the air with *vivas* and rejoicings. Neither should we omit to make mention of the piazza and piazzetta of St. Mark. It was a sight of which they alone who have seen a Venetian carnival can form any just notion. Light streamed through every window of the princely palaces that lined these squares, which were traversed by hundreds in their gayest attire. The sounds of lutes, and the songs of minstrels resounded on every side, broken upon from time to time by plaudits and shouts of laughter. Upon the next day there were boat racing, and those fights, *dei bastoni* and *dei pugni*, in which the Venetians delighted, wherein two contending parties endeavoured to maintain one of the principal bridges over the canals, fighting, in the former case, with staffs; in the latter, with their hands alone. In the struggling, numbers of the combatants were sure to be tossed over the low battlements into the water, to the infinite delight of the populace, who crowded the banks at either side, or sat in gondolas in the canal ready to receive the involuntary divers and pick them up when they had got a sufficient ducking. The mountebanks, too, plied their vocation in the squares, amongst whom was pre-eminent our old acquaintance Bartolomeo Venturini, the prince of *Ciarlatani*, who gashed his flesh, played with snakes, ate fire, vomited smoke and flame from his mouth, ears, and nostrils, told fortunes, sold drugs, potions, elixirs, and charms, and befooled, bewildered, and picked the pockets of the cittadini and their wives to a surprising extent.

Such were the triumphant celebrations in Venice of the great victory achieved over the Genoese by the recapture of Chioggia. One looks back upon them with mingled feelings of wonder and sadness, for he remembers that all her great spirits are fled for ever; her doges no more rule the Adriatic, her navies no longer sweep the seas, her nobles are wanderers or beggars, her citizens serve the strangers who visit her, her palaces are the hired houses of the wealthy of other lands or locanda and hotels for the man of pleasure and the tourist. Naught remains but the fair body of the beautiful dead, whose soul is departed; there she lies corse-like in her lifeless loveliness, decked out and placid in the repose of death, with the same glorious skies above her, the same waters kissing her fair feet, the same sun gilding her church-domes and palace-roofs. A city of memories that are as immortal as they are saddening.

PALM TREES, AND THEIR PRODUCTS.

When the painter wishes to represent a tropical land, he depicts a landscape with palm trees, and the characteristic physiognomy of the picture is half accomplished. In truth, these graceful denizens of the forest are essentially tropical; only two species, tiny little shrub-like things, scarcely bigger than a lady's fan, being indigenous to any temperate clime. One is called the *chamærops humilis*, and is a native of Spain, Italy, and Greece. The other, *chamærops palmetta*, and is a native of North America. In Spain, the leaves of the former are employed as materials for the manufacture of sweeping-brooms.

With the solitary exception of this dwarf species, of all the species of palms which botanists are acquainted with, no less than 175 are trees—sometimes gigantic trees, and always graceful.

But it is not for the sake of their beauty alone that palms are worthy to be noticed. They are not mere elegant sultanas of the forest, spending a luxurious idle life—rearing their proud heads aloft, and waving their delicate plumes to the breeze; far from it—palm trees, though they are very beautiful, are still more useful; no vegetable genus yielding such a variety of products.

FIG. 1.—THE SAGO PALM (*Sagus Rumphii*).

Now, just let us take a glance at these products, and try to enumerate some of the chief amongst them; one may be well pardoned for skipping over some, so varied and so numerous are they.

Let us see then:—There is the cocoa-nut to begin with—this is the product of a palm. And here it is necessary for us to be precise, and to state that by the term cocoa-nut, we mean the large bullet-like thing with a thick shell, and a central cavity filled with a liquid which people are agreed to term *milk*,—not, however, that it resembles the animal fluid very much, even in appearance. This explanation is necessary, inasmuch as some people confound the palm cocoa-nut with that which, being ground in a mill, furnishes the cocoa of the shops—the two have not the slightest alliance, botanical or otherwise; neither does the cocoa-making cocoa-nut grow on a palm. The date, again, is the produce of a palm tree; and whilst on this topic, the reader's attention may be drawn to a somewhat curious fact. The hard stone which lies in the centre of a date, and which can scarcely be cut by hammer and chisel, so tough and hard is it—this date-stone is the part which corresponds with the edible portion of a cocoa-nut—and conversely, the shell of a cocoa-nut is the corresponding part to the edible and fleshy portion of the date. Cocoa-nuts and dates having suggested their respective trees, the sight of a composite candle reminds us of the oil-palm, that valuable tree which supplies the negroes with a substitute for butter, and helps to form our soap, candles, and lubricating fat for railway axles. Sago, again, is the produce of a palm; as is also the valuable astringent, *catechu*, so useful in medicine and the manufacture of leather. Various in their properties as are the bodies already mentioned, as being the produce of the palm tribe, they are only a few instances chosen almost at random, and give but a faint notion of the rich treasures derived from the tribe of palms.

We have hitherto considered each species as affording us only one single product; but this is hardly doing justice to our friends the palms. For instance, take the cocoa-nut palm. In the first place, it yields us its fruit, the nuts; but these are not a tenth of its products. Those graceful leaves,

FIG. 2.—THE GUINEA OIL-PALM (*Elæis Guineensis*).

which wave like an enormous plume of ostrich-feathers in the breeze, were once enveloped in a sheath, forming a sort of gigantic, unexpanded bud. In this state it resembles a cabbage in appearance; and if cut just at this period, it is delicious to eat after boiling, forming a very good substitute for the cabbage, to which, indeed, it is preferred by many. Then, again, the juice of the cocoa-nut palm, and indeed of many others, is valuable. If collected and allowed to ferment, it yields a very agreeable wine; but if evaporated whilst fresh, it yields sugar precisely similar to that of the cane. Although the juice of the cocoa-nut palm is saccharine, yet that of the date-palm is more saccharine still. A great many specimens of those finely-crystallised sugars now brought from the East Indies were never extracted from the cane, but were obtained from the juice of various species of palm trees, more especially the date-palm. Returning to the cocoa-palm (fig. 3), and scrutinising its productions more narrowly, we shall find that others yet remainto be adverted to. Who does not know that the external husk of the cocoa-nut yields, when properly manipulated, a valuable textile fibre? In regions where the

cocoa-palm grows, this property of the fibre of its husk has been known to the natives from time immemorial; but amongst ourselves the discovery of this property is altogether modern, and resulted, like many other good things, in accident, as follows.

The oil which cocoa-nuts yield, when expressed, was found, about the year 1840, to be a valuable material. At least the oil was in that year applied to the manufacture of candles, being mixed with palm-oil, and treated by a chemical process, concerning which we shall have a little to say hereafter. Well, the process of subjecting ground cocoa-nuts to pressure, in order to extract their oil, requires the use of bags of some coarse fabric. When first the manufactory was established in Ceylon, these fabrics were conveyed there from England; until at last W. Wilson discovered that the best fabric for the construction of pressure-bags was that obtained from the husk of the cocoa-nut itself. Then arose the introduction of cocoa-nut fibre to commerce for many other purposes. Beds are now stuffed with it, mats formed of it—ropes, cordage, hearth-rugs, brushes, and, in short, to so great a variety of different purposes is it applied, that we relinquish, in despair, the task of enumerating them.

Having thus given, by anticipation, a slight view of the great importance of the palm tribe; having mentioned a few of their products, and indicated the purposes to which they are applied—we will now go a little more minutely into the natural history and botany of palms, diverging occasionally for the purpose of taking a glance at the arts and sciences involved in the utilisation of their products. Palms, although usually very large trees, are very nearly allied, botanically speaking, to the lilies and bulrushes, which latter, in general terms, may be said to be their representatives in the temperate zone.

Palms belong to that great division of the vegetable kingdom which botanists term *endogenous*, inasmuch as their stems grow by the central deposition of woody fibre; the word

FIG. 3.—THE COCOA-NUT PALM (*Cocos Nucifera*).

endogenous signifying, growing internally or within. It is in tropical lands that the endogenous form of vegetable structure assumes its greatest development, not only constituting certain gigantic trees of which palms are one species, but presenting itself in the shape of bamboos, canes, and grasses, with which we, inhabitants of a temperate zone, can only become acquainted by description, or by the stunted pigmy-like off-shoots which sometimes vegetate (flourish one cannot say) in our palmariums and hot-houses.

All the large trees of temperate climes are of exogenous growth—that is to say, their stem increases in size by annual depositions of woody fibre externally, or next to the bark,

whence arises the denomination *exogenous*, which signifies, growing without or externally, just as *endogenous* signifies growing internally or within. The largest endogenous plants which temperate climes produce are the tall grasses, such as wheat, barley, oats, &c.

The determination whether a vegetable belongs to the endogenous or exogenous class is easily arrived at by several modes of investigation, the simplest of which, in cases where it can be applied, consists in the examination of a section of the vegetable trunk. If any of our native trees be cut across, and the plane of section polished, a prime indication of exogenous development will be seen. The trunk will be observed to consist of numerous concentric rings, each corresponding to the growth of one season, and therefore from an examination of them the age of the tree may be predicted. Moreover, the distinction between pith, wood, and bark will be complete; each of these several portions of the vegetable trunk being well marked.

On cutting across an endogenous trunk—the larger the better, hence the trunk of a palm tree is best, although the section of a rattan cane affords satisfactory indications—a great difference of structure between this and the structure of the exogenous vegetable will be manifest. In the first place, there is no longer recognisable any well-marked distinction between pith, wood, and bark; all three of which are confused and in a manner blended together. Secondly, the concentric rings, so evident in the other case, and so distinctive, are here altogether wanting. The vegetable tissue appears thrown confusedly together, an appearance which results from the peculiar manner in which the trunk is formed—namely, by the internal deposition of woody fibre,—hence the term *endogenous*.

Perhaps the section of the trunk cannot be obtained. In this case the determination may readily be made by an examination of a leaf. The leaf-veins of exogenous plants are reticulated, whereas those of endogenous plants are parallel. A third method of distinguishing endogenous from exogenous plants is afforded, at least in the majority of instances, by the seed, which in endogenous plants only consists of one lobe, or cotyledon, whereas the seeds of exogenous plants consist of two. Hence arise the botanical terms *monocotyledonous* and *dicotyledonous*, which are respectively employed to indicate endogenous and exogenous plants. This botanical digression (necessary, however, to the satisfactory comprehension of our subject) has led us away from the consideration of palms, but we will now resume their description.

We have already stated that palm-trees may be regarded as botanically allied to the lilies and bulrushes of temperate regions. Let not the non-botanical reader think the comparison strange; he will find, when he comes to be acquainted with the principles of botanical science, that the mere size of vegetables has little or nothing to do with their alliances. The nature of the organs of fructification is a far surer sign; guided by these and some other appearances, the botanist refers the various members of the vegetable world to their proper natural families. In this way it is found that rose-bushes and apple-trees are very nearly allied; as in like manner are nettles, elm, and fig-trees. It is not our object to explain fully the nature of such botanical alliances, these forming the proper subjects of a treatise on botany rather than an occasional article. We will, however, direct the reader's attention to one little peculiarity of inflorescence, that is to say, the nature and arrangement of flowers; from a consideration of which he will at once recognise a similarity or alliance in this respect between bulrushes and palms. The flowers of both consist of what botanists term a *spadix*, enveloped by a *spathe*.

A spadix consists of a long projection, that imaginative botanists liken to a sword, which, being denominated *spada* in Latin, this form of inflorescence is termed a *spadix*. Arranged upon this spadix, and growing out of it, are seen flowers and young fruit, and enveloping the spadix with its appendages is seen a leaf-like sheath; this latter is termed a spathe. A good example of a spadix enclosed in a spathe is furnished by the *Arum maculatum* of botanists, which is found in hedgerows. The common bulrush, with which our country readers must be familiar, supplies an instance of the spadix without a spathe.

Viewed with regard to their woody fibre, palm-trees exhibit great similarities to the stem of ferns. The likeness may be observed even on examining one of our own English ferns; but the resemblance is still greater when the section of one of the tropical tree-ferns is the subject of comparison. Like these tree-ferns, too, palm-trees must have been created very early in the history of the world. Evidence to this effect is furnished to us by the existing coal-fields of many regions. For the most part, these coal regions consist of fossilised ferns; but the remains of palm-trees are also found; this is our proof.

Palm trees are now found growing native in Europe Asia, Africa, America, and Australia; but with the exception of two dwarf species, the *chamærops humilis*, in Europe, and the *chamærops palmetta*, in North America, they are all denizens of tropical lands, and their region may be considered as bounded by the thirty-fifth degree of northern, and the fortieth of southern latitude. Nevertheless, one species at least, the date-palm, has been so far naturalised in certain localities of Southern Europe, especially Andalusia and Valencia, that it grows to maturity and produces fruit—though far inferior to the dates of Africa. The greatest authority on palm trees is Herr Von Martius, a German botanist, who, with a view of studying their characteristics, devoted three years to a travelling excursion in Brazil—a region more rich in palms than any on the face of the globe. This botanist considers that there are existing at this time upwards of a thousand species of palms. If the opinion be correct, future botanical explorers have a rich field of investigation yet untrodden, inasmuch as no more than 175 species have yet been individualised and described: of these, 119 belong to South America, 42 to India, and 14 to Africa. Cosmopolitan denizens of the vegetable world, as we have seen that palm trees are, different species affect different localities. Some love to wave on mountain crests, others delight to fringe the sea-coast, and others will only arrive at perfection on the banks of rivers and streams; moreover, with few exceptions, a few species refuse to flourish if taken from their own native land, and conveyed to another of seemingly identical climate. Amongst the few exceptions to this rule, the cocoa-nut palm and the date-palm deserve especial mention; provided the climate be hot enough, and that the sea be near enough, they flourish and bring forth fruit. It is a very curious fact, not satisfactorily accounted for, that the cocoa-nut palm will not flourish at any great distance from the sea: hence, islands are best adapted to their culture, and in Central Africa there are none. Botanists are inclined to refer this predilection for the sea-shore to the tendency which these trees have to take up salt; and the idea is partly confirmed by the known fact of their partiality, if the term may be allowed, for alkaline food. In Ceylon, which may be regarded as the head-quarters of cocoa-nut palms, the natives have a proverb, that the tree likes conversation. The houses of Cingalese villages are built amidst groves of cocoa-nut palms, under which condition the trees thrive best. This fact is usually attributed, and it would seem justly, to the fact, that the natives treat their conversation-loving friends to a frequent dressing of their own ashes. So great an amount of alkali do the ashes of these trees contain, that the Cingalese washerwomen rarely employ any soap; but steeping the ashes in water to extract the alkali, they employ the resulting fluid.

At the very commencement of our present remarks we stated a few of the purposes to which the various portions of cocoa-nut palm (fig. 3) might be rendered subservient. We mentioned that in addition to the nut employed as food, the external husk yielded material for ropes and cordage; we mentioned that sugar might be obtained from the juice. In addition to these products, the spirit, known as arrack, is distilled from this same juice when fermented; then the midrib or central vein of the leaf, when properly trimmed, is employed as an oar for rowing; the lower part of the stem yields a wood exceedingly hard, and susceptible of taking so high a polish,

that in this condition it might be almost mistaken for agate. In addition to these various applications, houses—good, strong, and substantial—are frequently constructed of the cocoa-palm trunks, and the roofs thatched with cocoa-palm leaves. These same leaves, when cut into strips of suitable length, serve as tablets for writing purposes. Their surface being covered with a flinty coat, the latter is susceptible of removal by the point of a metallic style; and in this way the Cingalese write, or rather engrave, on the leaf with remarkable facility, occasionally rendering the writing more legible by filling the graved indentation with a black pigment. It must here be remarked, however, that although the cocoa-nut leaf answers this purpose very well, there is another palm—the *Talipot*, which answers still better, inasmuch as the breadth capable of being written upon is wider than is the same part in the leaf of the cocoa-nut palm.

We have now, the reader will admit, given a tolerably long list of applications to which these Jack-of-all-trades of the forest are applied; but our list is not yet complete; and, indeed, to complete it would be difficult; therefore we shall rest content with stating, that the cocoa-nut palm not merely gives us a material out of which cordage can be made—and therefore, as a matter of course, cloth if we wish—but also actually furnishes cloth ready made to our hands. Each leaf grows out of a sort of sack, which, being stripped off, is so good a substitute for cloth, that it is employed in Ceylon as a strainer for the cocoa-nut juice, out of which sugar or arrack, according to circumstances, is destined to be extracted. Before finally taking leave of the cocoa-nut palm, it may be as well to state, that it grows to an elevation of from sixty to ninety feet—sometimes more—and its diameter is from one to two feet.

The juice, of which we have spoken, is extracted by puncturing the spathe, consequently it only admits of collection by climbing the tree. The Cingalese perform this feat in a very remarkable manner. They first surround the tree to be ascended with a hoop formed out of a length of one of the climbing plants with which the country abounds, and then the native inserts his legs between the hoop and the tree; and by a sort of wriggling motion, very similar to that by which a chimney-sweep ascends a chimney, he at length arrives at the top, fills his earthern jar with the juice, and comes down again. This is the plan followed, provided the tree stands alone; more usually, however, they grow in groups, and as the act of wriggling up the stem is not particularly agreeable, the dusky operator has recourse to the following ingenious contrivance. He commences work by ascending one tree, carrying with him a rope, by means of which he binds all the tree tops together; then, spider-like, he crawls across his meshes, collects his juice, lowers the pot by a cord, and recommences operations as before.

From the cocoa-nut palm, we now proceed to the sago palm (fig. 1), or more strictly speaking, sago palms, inasmuch as various species yield this nutritive material. Of these, however, the *Sagus farinifera* and the *Phœnix farinifera* are the chief. Sago is neither more nor less than a very delicate, agreeable-tasting starch, constituting the pith, to use a comprehensive term, or, more strictly speaking, the central portion of the stem. Nothing can be more easy than the process of sago extraction. The palm being cut down and split open, or divided into short transverse sections, and the central portion scooped out and washed, the sago is deposited. The only hard and woody portion of the stem of this species of palm is its outside; and of this the natives of Siam and the Malayan Archipelago, where it grows, make the bodies of their drums.

Although Africa is not very rich in species of palms, those which it does produce of this family are exceedingly valuable. Nowhere does the date-palm arrive at greater perfection than in the North of Africa; and the oil-palm of Guinea, concerning which we shall have to say more hereafter, is of the highest importance, as furnishing an excellent raw material applicable to the manufacture of candles, soap, and many other purposes. Appended (fig. 2), the reader will see a representation of this species. He is a very shaggy looking individual, certainly less beautiful than many others we could mention, but perhaps inferior to none in utility.

VALLEY OF LAUTERBRUNNEN.

The Valley of Lauterbrunnen is the favourite resort of summer tourists in Switzerland. Its length is about fifteen miles; its breadth seldom exceeds half a mile. It has been likened to a deep chasm formed in a mass of mountains, and straitened between the vertical walls of the cliff. There is scarcely any country in the world which contains so many cascades in so small a space as this valley. A recent writer says, "In the way of valley there is nothing like it; the crag, the torrent, the lonely châlet, the rock of the hunter, the eternal Alps, and all the delicious fillings up of turf and tree are here strewn about by a mighty hand." On the western side, the enormous chain of rocks is more lofty and craggy than on the opposite side, and from this abrupt declivity the streams rush down to swell the waters of the Lütschine. About a mile and a half up the valley is the Scheinige Platte, with its red and rounded summit, from which it is said the genius of the mountain once flung a chamois hunter.

A strange old story is this Lauterbrunnen legend, and a fitting locality is that which has been selected as the site of the event. Once upon a time a hunter, bold as a lion, and an ardent lover of the chase, pursued a doe heavy with young, from rock to rock, from crag to crag. At length the poor animal was completely exhausted, and on reaching the edge of a steep precipice her strength failed, and she sank down to die. The stag, when sorely pressed, when no hope of escape remains, when the bay of the hound draws near—weeps—so wept the doe; but the hunter's heart was steeled, and preparing his cross-bow, he took a deadly aim. Suddenly his hand shook, his limbs trembled, his eyes were fastened on the figure of an aged man, who, seated on the rock, stretched out his hand, which the chamois licked with affection. "Man of the valley," the stranger said, "to whom God has given all the riches of the plain, why dost thou pollute this mountain with thine unhallowed footsteps? I do not come down and take your chickens from the coop, your oxen from the stall; why then do you come up to me, to slay the chamois of the rock, the eagle of the clouds?" The man replied, though trembling and afraid, that he was poor, that he could not obtain food in the valley, and so had been driven to seek it on the mountain. At this the ghostly man, the apparition of the Lauterbrunnen, appeared to reflect, and after a little began to milk the doe, and the milk changed immediately into cheese. "Here," said he, "is something to satisfy your hunger. It will last for ever, provided you leave unmolested the chamois and the eagle." And so the man took the cheese and departed; and sure enough, the story goes, his cupboard from that day was always found well supplied with this dainty and miraculous cheese; it bulked out an endless feast, and the chamois gained confidence in man and came down into the valley. One day the old love of sport came strongly on the man, and as he watched the chamois play before his châlet, he lifted his cross-bow, took aim, and killed it. Like the albatross, shot by the ancient mariner, it proved a bitter curse to him. The cheese lasted no longer. The man hunted as heretofore up among the craggy tops and mountain heights, until at last came the end: a chamois, shot by him, fell over a precipice; he watched its terrible descent, striking now upon this outstretched branch, now on yon craggy point; but, lo, at the bottom there

were two eyes, fiery eyes, eyes of the old man of the mountain, from whose steady glance he could not conceal himself, could not draw back, but turning dizzy, trembling like a leaf, fell over and was seen no more. Such is the legend of the Scheinige Platte.

The village, which takes its name from the valley, is simple and unpretending, and consists of a church, a parsonage, an inn, and a few cottages. The Staubbach—"fall of dust"—is the grand feature of the district, and just before the traveller

THE VALLEY OF LAUTERBRUNNEN, AND THE CASCADE OF THE STAUBBACH.

enters the village, a fine view of this cascade may be obtained. The water falls nine hundred feet perpendicularly—

> And flings its lines of foaming light along
> And to and fro, like the pale courser's tail,
> The giant steed to be bestrode by Death,
> As told in the Apocalypse.

The Staubbach is remarkable not so much for the volume of its waters as for the height from which it falls. To be seen to the best advantage the cascade should be viewed when illuminated by the rays of the sun. Perhaps no object in Switzerland has excited so much observation, and so many contrary opinions. One calls it "a river rising in the air," another, "a wave impetuously rushing from the empyrean," another says, "it wants sublimity," and a fourth, a lady, condemns it as "a poor thing," which, she remarks, is high treason in the valley, but true nevertheless. Wordsworth calls it "a sky-born waterfall." Says he:—

> "Uttered by whom, or how inspired—designed
> For what strange service does this concert reach
> Our ears, and near the dwellings of mankind,
> Mid fields familiarised to human speech?—
> No mermaids warble, to allay the wind;
> Driving some vessel toward a dangerous beach—
> More thrilling melodies; witch answering witch,
> To chant a love-spell, never intertwined
> Notes shrill and wild with art more musical;
> Alas! that from the lips of abject want,
> Or idleness in tatters mendicant,
> The strain should flow—free fancy to enthral,
> And with regret and useless pity haunt
> This bold, this bright, this sky-born WATERFALL!"

The valley of Lauterbrunnen is remarkable for the luxuriance of its vegetation. M. Raemond examined very carefully the formation of the valley, and was led to consider it as an accidental crevice formed by some revolution of nature, by which the rivers were broken in their course, and left to pour their waters into the gulf that opened before them.

OMAR PASHA.

THE rise of statesmen and generals in England has not in all cases been creditable or satisfactory. Even in this country intrigue has been known to outstrip merit, and connexion every day proves more powerful than service. Yet our greatest civil functionaries, and pre-eminently, our first military officers, owe their advancement and their position to a long series of meritorious deeds, and to achievements, for the accomplishment of which the experience was necessary which ensues from a patient apprenticeship and a gradual elevation.

In the Ottoman Empire distinguished eminence seems rather given by fate than earned by desert. We do not mean, that without merit subjects of the sultan can vault into power; but we do mean, that it is by a leap or two, rather than by slow steps, that his chief officers commonly attain their eminence. Certainly, men who were yesterday in a very low, if not the lowest, station, may find themselves to-day at the head of an army, or councillors in the imperial divan. Sudden and extraordinary has been the rise of Omar Pasha. His proper name is Lattas. His family are immigrants in Croatia; consequently, by birth, Omar Pasha is an Austrian subject. His father held a military post in the Austrian service. He had an uncle, who was a Greek priest, of more than ordinary merit. A son of that priest is also an officer in the Austrian army. Omar Pasha himself is said to have been born in the year 1811 (another account gives 1801), at Plaski, in the district of Ogulin, in Austrian Croatia. Frequenting the

OMAR PASHA.

military normal high school in that city, he acquired the knowledge and mental discipline whence have flowed his power and distinction. Among acquirements of a much higher kind, he formed a beautiful hand, which proved of no small service in the commencement of his career. Afterwards he became a pupil in the mathematical school at Thurm, near Carlstadt. On completing his studies in that institution, he was incorporated in the Ogulin regiment in the capacity of cadet. Then he accepted a civil office, in which his caligraphy was his chief recommendation. Major Cajetan Kreezig, his employer, is said to have taken special pains to improve and guide the young man, who, however, seems to have neglected his duties, and in consequence found it convenient to relinquish his post. Hastening into Bosnia, he entered the service of a Turkish merchant. There his higher qualifications became known, and received recognition. Having renounced Christianity, and given his allegiance to the prophet of Mecca, Omar Pasha was made domestic tutor by his employer, whose children he accompanied to Constantinople. In that city he became writing-master in a military school. In that office, Lattas, now Omar Pasha, acquitted himself so well, that he was appointed by the now deceased sultan, Mahmud, writing-master to prince Abdul Medshid, at present the reigning sovereign. At the same time he was incorporated in the Turkish army as an officer. When, not long afterwards, his pupil came to supreme power, Omar was advanced to higher military posts. He proved very serviceable in the reform of the training system of the Turkish artillery, which has now so high a character. In consequence of his services in this and in other measures of improvement, Omar Pasha rose rapidly in the confidence and favour of the sultan, received the high appointment of Mushir, or Field-marshal, and was employed in several very difficult tasks, as the suppression of the rising of the Druses in the Lebanon.

In two recent events of great importance to Turkey, Omar Pasha has played the leading part: we allude to the pacification of Bosnia and to the Montenegrin war. It is well known that the sultan has for years past been endeavouring to reinvigorate his disjointed empire by the introduction of a system of civil reforms. The work has everywhere been one of great difficulty. It was so in Bosnia, where, instead of one head, there were a multitude of feudatories, small and great, each of whom exercised considerable power within his own district. Those vassals, descended from the old Bosnian nobility, established there in the time of the Hungarian domination, were Mohammedans, but in their relations with the Porte the diversity of races was not effaced under the power of a common religion. Yet those Bosnian feudatories, though of Sclavonic blood, as are the Christians who dwell near and among them, were far from making common cause with those interesting populations. Here the sentiment of a unity of race disappeared before the diversity of religion. Thus the great proprietors of Bosnia were at once suspected by the Turks, whose dominion they disliked, and hateful to the Christians, whom they pitilessly oppressed.

These beys, or local princes, had always resisted the introduction of the Tanzimat, or system of reform; and when, in 1849, the Porte attempted to impose it on that province, it encountered a well-concerted conspiracy. The prevalent representation on which it had been raised was, that the sultan aimed thereby to substitute for the local authorities his sovereign power, and, as a consequence, to exact heavy tribute from the feudal lords. The insurrection was at first feebly opposed. It soon became necessary to send into the province a complete army; the command naturally devolved on the first general of the Kalifat, Omar Pasha. He entered on the duty of suppressing the insurrection with zeal and prudence; but it was only after a long and costly expedition that, in 1851, he succeeded in gaining the mastery over those sanguinary agitations. The conduct which the commander-in-chief observed toward the Bosnian Christians in the settlement partook no little of the spirit of a Moslem conqueror; yet it is true, that from the reforms which he succeeded in enforcing they derived no mean advantages. Nevertheless, their condition remained sufficiently unsatisfactory to give some colour to those claims of Russia which have led to the Russian invasion of the sultan's dominions.

That invasion was the less hesitatingly made, from the result of the Montenegrin war, which seemed but too clearly to show the weakness of the Ottoman empire. Montenegro (Black Mountain) is a small province lying south of Bosnia, in the extreme west of the sultan's territories on the Adriatic, and in the immediate vicinity of the lands belonging to the Emperor of Austria. Of old, the Montenegrins were Ottoman subjects. But near the close of the last century they vindicated for themselves some sort of independence. This they were enabled to effect in consequence of the mountainous character of their country. The death of the vladika, or prince, Peter Petrowitsh Niegosh, led to the transformation of a theocracy into a purely civil government, in the hands of an hereditary monarch, Daniel Petrowitsh Niegosh, a creature of the emperor Nicholas, which seemed an open renunciation of the rights of the sultan, as undoubtedly it was a diminution of his power, if not an encroachment on his dominions. The revolution was joyously welcomed by the Montenegrin people. Omar Pasha, whose experience in the Bosnian war, had taught him the political and military importance of Montenegro, did all he could to impress upon his government the danger to which Turkey would be exposed, should these events become ratified, and lead to their natural consequences. While war from the sultan was debated in the Divan at Constantinople, the Montenegrins took the initiative, and commenced hostilities. Turkey was not slow to give a corresponding reply. Omar Pasha invaded Montenegro, and in spite of the bravery of its people, gained some advantages. Then Austria appeared on the stage. Retaining a grudge against the Porte for its liberal conduct in regard to Kossuth and the other Hungarian refugees, and being dissatisfied with measures taken by Omar Pasha in his military administration of Bosnia, and no little annoyed that in the Turkish army were many Polish exiles, Austria was but too glad of a pretext for interfering between the sultan and his dependants, and sent to Constantinople Count Leinigen (*Linange*, in French), to put forth complaints, and compel redress by supporting the Montenegrins. Meanwhile the Ottoman arms obtained but partial success. The natural strongholds of the land, defended by native valour, proved impregnable. Even the ability and prowess of Omar Pasha could do little more than maintain a doubtful position in the country. At length Austrian diplomacy prevailed, and the sultan drew out of the contest with a loss of territory, and a loss of credit. Omar Pasha had again proved himself a brave soldier and a great general, but he had failed to ward off from his sovereign a heavy blow.

With a zeal peculiar to renegades and recent converts, Omar Pasha has manifested active hostility against Christianity and Christians, and finds in that hostility a ground of confidence on the part of the Mohammedan Turks, who regard him as the hero of their cause.

A FEW WORDS FROM AUSTRALIA.

BY WILLIAM HOWITT.

McIvor Diggings, Victoria, July 1, 1353.

TRADE is as lucrative as labour, and numerous and enormous fortunes have been made since the discovery of the gold, and are still making in Melbourne and other parts of Victoria, by trade, and by watching the land market. Let, then, our countrymen at home consider the contents of my communication well, and they will be at no loss to see where the true advantage lies in this colony. Let them come as fast as they will, they cannot do wrong. There is labour enough, trade enough, room enough, and profit enough, for all. Let them only come divested of the empty delusion of making fortunes by gold-digging; the digging, planting, and selling of cabbages at a shilling a-piece is far preferable. Let them only come disabused of the idea that this country is a perfect paradise, and its climate that of the seventh heaven, and they will find a

good country and a fine climate. Let them expect swinging heat and a host of pestilent flies in summer; a good share of rain, snow, and ice, as well as warm sunshine, in winter; plenty of stinging ants and other insects in the bush; and knowing the drawbacks, they will in a while learn to think little of them. Let them remember that it is *unavoidably a country of thieves*, and they will be on their guard; that thousands are rushing hither with the sole object of making fortunes as rapidly as they can, and that consequently this colony is the very hot-bed of speculation and of exorbitant charges, and they will come properly prepared with money to meet the inevitable demands upon them. They will then not expect too much *conscience* or too little grasping in those with whom they will have to deal. Let them tread under their feet the *fable*, that this country is so free from diseases and disordered health, that doctors are unnecessary, and they will endure with more patience the attacks that they are pretty sure to pass through before they are acclimated. In Melbourne alone there are already about a hundred and fifty doctors, who seem well employed, and at the diggings especially the doctors flourish. Fever, dysentery, and influenza are the prevalent and fatal disorders. But perhaps the hard, monotonous diet in the bush and at the diggings—tea, mutton, and heavy damper—heavy damper, mutton, and tea—with the vile trash they sell for spirits, have more to do with these illnesses, in connexion with the exposures to rapidly alternative heat, cold, and wet, than simply the climate itself. But if people only weigh these things in the scale with the allurements held out to them by interested parties, who draw Arabian Nights' pictures of Australian felicity for them, they have little to fear and much to hope here.

It is true, that the continued influx of population will gradually reduce the price of labour, and divide and diminish the individual profits from trade; but, after all, there will be room enough and scope enough on this great island-continent. United Australia, such is its extent, the amount of its fertile as well as of its sterile land, its various advantages of sea-coast, of timber, of minerals, of climate for the growth of the products of the tropical or the more temperate latitudes, must assuredly become a mighty and magnificent empire. England is reproducing herself here on a larger scale; and the science, the industry, and the indomitable energies of her children will gradually diminish the drawbacks, while they increase the amenities, of the country and climate. When towns and villages are sprinkled over the country; when the land is opened up by cultivation, and water is carefully reservoired where it so extensively may; when ants, flies, scorpions, and centipedes are rooted out by the axe, the spade, and the plough, and are succeeded by cattle, corn-fields, and cocks and hens, this country will wear a far more smiling and inviting aspect. Instead of millions on millions of square miles of wild forest encumbered with dead timber, swarming with almost every species of insect, there will be the cheerful homestead, the finest fields, the bright verdure of vineyards and of gardens of European fruit-trees, and all the animating sights and sounds of civilised life. Those who come now are the pioneers of this pleasant futurity, and they must be content to do the work of pioneers, sure at the same time to be well rewarded for their toils.

I have thus written a brief statement, the result of my own experience, of what people ought and ought not to expect here. The details of our adventures up and down in these colonies, the scenes in the bush and at the diggings, which by-and-bye will appear, will, I think, form as curious, amusing, and I trust as important a narrative as has for a good while been produced.

Bendigo, July 25th, 1853.

Since I began these remarks, I have laid my hand upon the "Report of the Produce of the Gold Fields of Victoria, for 1852," published by Mr. Khull, the bullion-broker, of Melbourne, which being drawn chiefly from official sources, may be considered substantially correct. By this report, it appears that the total amount of gold, during last year, produced from the diggings of Victoria, was 4,175,247 ounces. Now this, divided by 200,000, the number of diggers estimated to be now engaged on the gold fields of this colony, gives less than £21, per man for the whole year, or much less than *half* an ounce per week per man! This is a far less amount than I had calculated on above (p. 280); and that 200,000 cannot be an over-estimate of the diggers, is shown by the same report which makes, from government returns, the number of persons arriving in the colony in 1852, no less than 104,883; being, in the words of the report, "an increase of 100 per cent. over the census of 1851." The amount, moreover, of arrivals this year has been far greater, as stated above.

But if we were to estimate the diggers at only half the number I have stated, or 100,000—an estimate far under the fact, for there are calculated to be 40,000 on this field of Bendigo—that will not give an ounce per man weekly. If, again, it be asserted that all who come out hither do not dig, I ask why? It is notorious that nine-tenths of those who come hither come expressly with the intention of digging, and thus of reaping a share of that amazing harvest of gold which interested parties, amongst whom ship-owners and ship-brokers are not the least, have led them to expect. If they do not, then, dig on their arrival, it must proceed from substantial reasons. Either they are disabused on their arrival in Melbourne, by plain facts, of the delusive ideas with which they set out, or they go up the country, do dig, and are cured of the gold-digging mania by their own sharp experience. In any case, there are the facts before you, and every one not determined to shut his eyes to the simple truth, can form his own conclusions.

This field of Bendigo covers an area of eight square miles. In one direction it extends about twenty miles in length, and the expanse of surface perforated and turned upside down is perfectly astonishing. I find many of the sinkings are from fifty to seventy feet deep—I have already been down such—and present all the aspect of a regular mining country. Whole hills are undermined, so that you may go all the way under them through the tunnels driven by the diggers. Yet even here, in the very metropolis of the diggings, and where the produce is confessedly more steady than anywhere else, I find the diggers complaining that they cannot, many of them, procure gold enough to purchase the necessary food and pay the monthly license. There is, therefore, a great and zealous agitation going on to compel government to reduce the monthly license from 30s. to 10s.; whether they will succeed remains to be seen. There is a general expectation that this coming month a large body of diggers will make a determined stand, refusing to take licenses.* Meantime, the number of fellows taking to the roads as bush-rangers is rapidly on the increase. We had two visits from them on the road from the M'Ivor, and it was only by a determined show of resistance that we got rid of them. But on the very same spot where they a second time made their appearance, they committed a daring robbery on three ladies the very next day, and I saw one of the scoundrels soon after brought into the government camp. Since then, twelve of them have attacked and robbed the private escort, four of the escort being severely wounded, and six of the bush-rangers being already taken; or, rather, six men are taken on suspicion of being part of them. Two of the wounded escort-guards are not expected to live. Out of eight persons, the number of the escort, two only escaped unhurt, and one of these, the officer, had fourteen shots fired at him. The rogues carried off 2,200 ounces of gold. The officer galloped off, having fired his last round of ammunition, to the government camp at M'Ivor, and in forty-five minutes after he announced the robbery there was a strong force of commissioners and troopers on the ground at fourteen miles' distance; but the scoundrels were off with their booty, leaving the poor men wounded on the ground. I hear from the commissioners here that three hundred diggers are scouring the country in pursuit of the bush-rangers, and vow that they will Lynch them if they catch them.

* This has been done successfully, the license system being now abandoned by government.—Ed.

BELLS AND BELL-FOUNDING.

We will suppose all the preliminaries successfully accomplished, and the various moulds ready to receive the melted metal; for, although we have described the working and preparing of only one set of moulds, there are generally some dozens of bells cast on the same day. We step into another large room, and here we witness the actua

FIG. 5.—DRAWING THE CRUCIBLE.

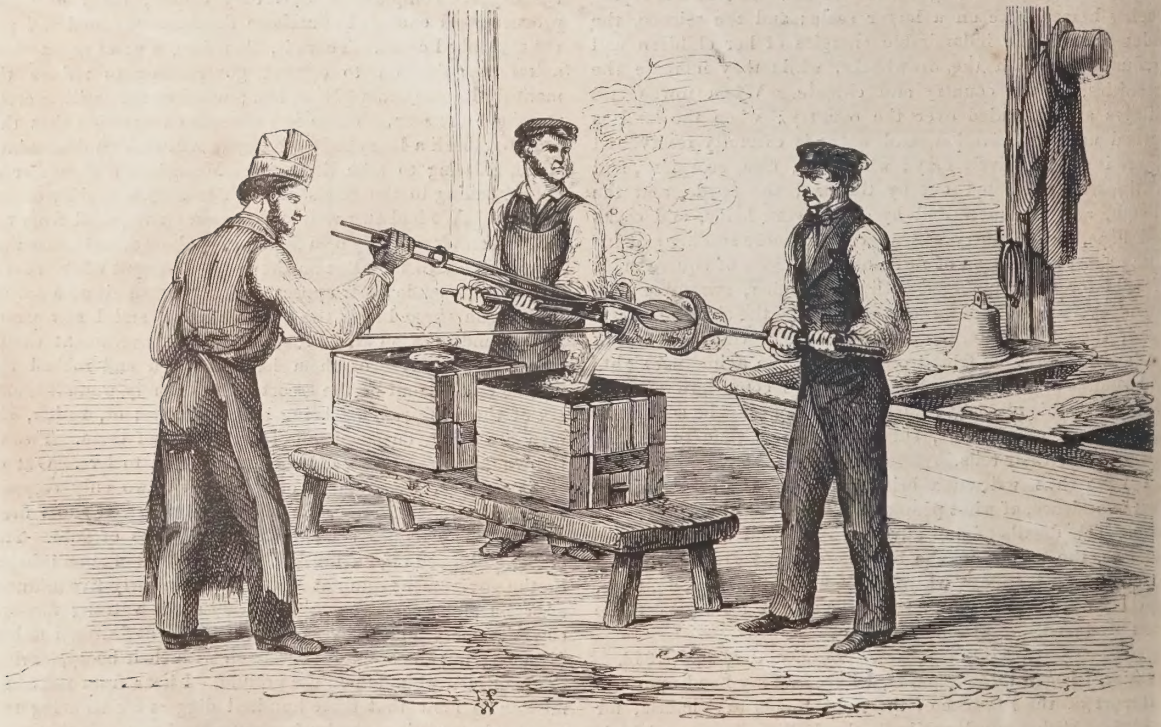


FIG. 6.—CASTING SMALL BELLS.

OPERATION OF BELL FOUNDING.

The various moulds having been brought into this part of

FIG. 7.—POURING THE METAL IN THE MOULD.

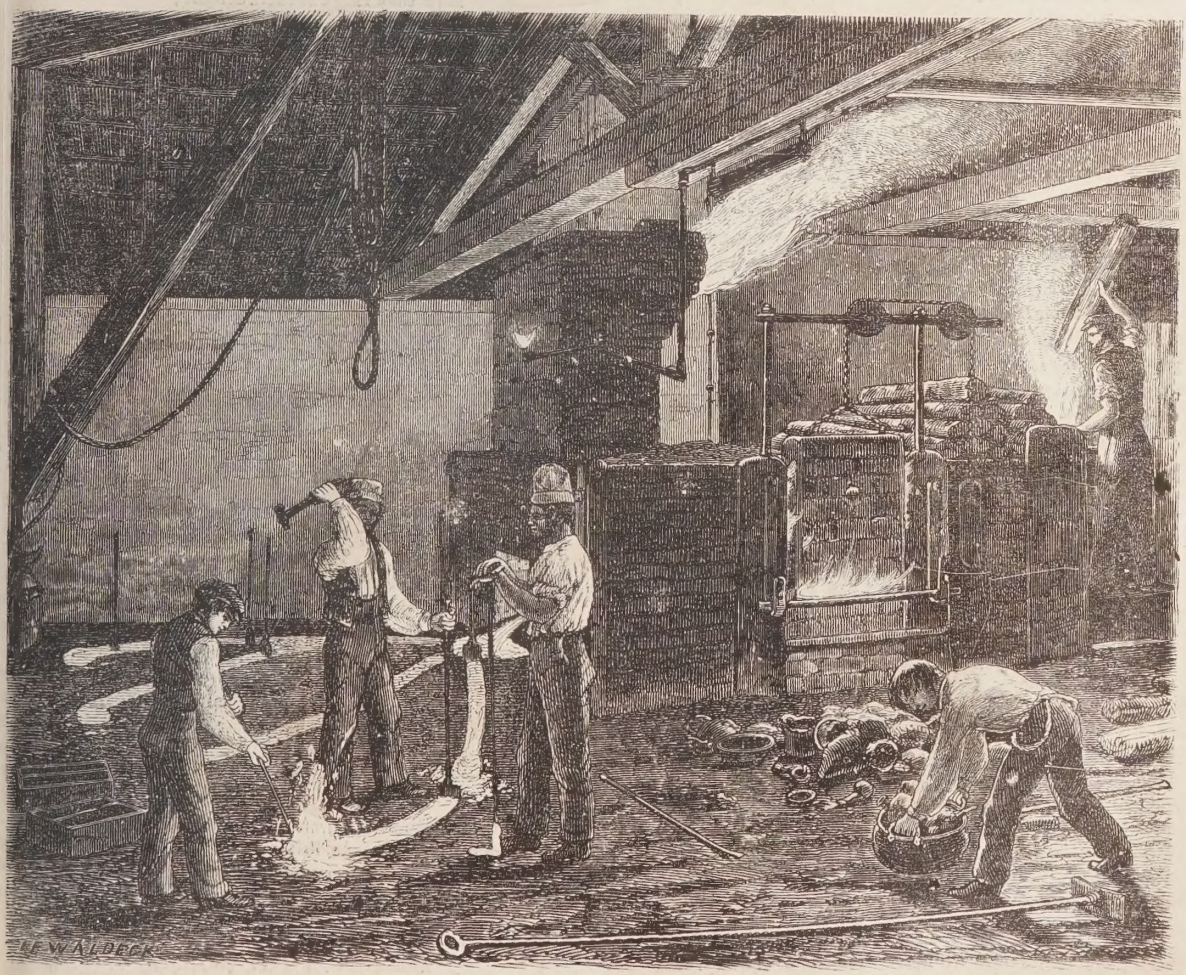

FIG. 8.—CASTING LARGE BELLS.

the factory, they are firmly embedded in the earth, and nothing of them is visible but the holes in their caps. On the occasion of the casting of a peal of large bells, the fused metal is carried at once from the furnace to the pit by means of a series of gutters, and when one bell is completed the fiery wave is stopped off and directed to the mouth of another mould. Our artist has very graphically described this scene (fig. 8). The bell-metal being tested and found to be of the right temperature, the furnace doors are opened, and out rushes the liquid fire, bubbling and boiling in a white heat too fierce to look upon. "Is the bell," says Schiller, in his famous Song of the Bell—

> "Is the bell in the ground well-bedded?
> Is the mould well set and steadied?
> Skill and diligence to pay,
> Will it issue fair to-day?
> Should the cast not hit,
> Should the coping split;
> Ah! perhaps while hopes elate us
> Now, e'en now, mishaps await us!"

Mishaps, however, seldom happen at Messrs. Mears' foundry, where everything is conducted on sound and scientific principles. As many as a dozen large and many small bells are cast at one melting, and as much as twenty tons of metal consumed. In the Montreal Foundry, so called from the fact that the great bell mentioned below was cast in it, a pit is especially prepared close to the furnace door to prevent the waste or cooling of the metal, on the occasion of any "great cast;" on ordinary occasions, however, the metal is melted in crucibles (as shown in figure 5), and being carried from place to place is poured into moulds just as the poet describes the process:—

> "In the furnace the dry branches crackle; the crucible shines as with gold
> As they carry the hot flaming metal in haste from the fire to the mould;
> Loud roar the bellows, and louder, the flames as they shrieking escape,
> And loud is the song of the workmen who watch o'er the fast-filling shape.
> To and fro in the red glaring chamber the proud master anxiously moves,
> And the quick and the skilful he praiseth, and the dull and the sluggard reproves;
> And the heart in his bosom expandeth as the thick bubbling metal upswells,
> For like to the birth of his children he watcheth the birth of the bells!"

In our day no song of the bell greets the final accomplishment of the successful day's work; but what is much better, the workmen are well paid, intelligent, and contented. Some of the persons in Messrs. Mears' employment have worked in the foundry for more than thirty years.

In the casting of small bells, such as hand and house tintinnabulums, precisely the same process as above described takes place, with only such modifications as their size renders necessary. An ordinary sized bell takes about twenty-four hours to cool; but a bell like that cast for the Montreal church would not be touchable to the hardest of fingers under about four days. When they are cool they are dug out of their pits, the moulds being destroyed in the process, when they are taken at once to

THE TUNING ROOM.

On the occasion of our visit there were in the tuning room a peal of eight bells, which had just then been cast for a church in Port Phillip, ready tuned, and only waiting to be shipped. Standing on their crowns, the tuner very dextrously struck out such a "change" as made us almost exclaim with the Frenchman—

> "Disturbers of the human race
> Whose chimes are always ringing,
> I wish the ropes were round your necks,
> And you about them swinging;"

but, then, it must be stated, that the sound of such a powerful peal as this is not often heard in a room less than twenty feet square.

The process of tuning a bell is a very simple one. Sometimes a peal of bells is cast in harmony, in which case it is called a maiden peal, and no tuning is required. Such peals we were assured are by no means common, and are nearly always imperfect. Separate bells do not require tuning. The action of the wheel and cutters of the machine employed in the process of tuning is very simple, and will be readily understood by any one acquainted with machinery. This instrument is driven by a small steam-engine, which also does a great deal of work in the different parts of the factory, in the way of lifting, carrying, &c. When the tone of the bell is too sharp, it is turned thinner; and if it be too flat, the diameter is lessened in proportion to its substance. But such is the general correctness of the scientific principles in use in this foundry, that very little tuning is requisite. If the quantity of metal in a bell is too small in proportion to its calibre, as is sometimes the case, the power and quality of its tone is altogether lost, and only a *panny*, harsh, iron-like sound is produced from it. In such a case it is invariably re-cast.

There is really very little to be said of the *manufacture* of bells. Much may, however, be written of their associations. Who has not listened, "delighted, yet sad," to the chimes as they float across the water at night? Who amongst us cannot sympathise with the American poet, when, in full harmonious swell, he breaks out into a strain like this?—

> "Hear the mellow wedding bells—
> Golden bells!
> What a world of happiness their harmony foretells!
> Through the balmy air of night,
> How they ring out their delight;
> From the molten—golden notes
> All in tune.
> What a liquid ditty floats
> To the dove, that listens while she gloats
> On the moon!
> Oh! from out the sounding cells
> What a gush of euphony voluminously wells?
> How it swells,
> How it dwells
> On the future! How it tells
> Of the rapture that impels
> To the swinging and the ringing
> Of the bells, bells, bells,
> Of the bells, bells, bells, bells.
> Bells, bells, bells,
> To the rhyming and the chiming of the BELLS!"

Our *changes* are almost rung out, but we may yet indulge for a little space to notice the origin of

CHIMES, CARILLONS, AND PEAL-RINGING.

And here again we must acknowledge our obligations to Mr. Gatty's charming little volume. Ours has been called "the ringing island." In other countries, the music of bells is obtained by striking them from the outside, as in Russia, or by means of chimes regulated by pegged barrels moved by clockwork, as in France; or by means of carillon pedals played with keys like an organ, as in the Netherlands. All these methods of bell-playing have also been adopted occasionally in our own country, but notwithstanding that chimes have been often fitted to our cathedral bells, the old national plan of ringing by ropes and manual labour is at once the most popular and most musical. "Carillons," says Dr. Burney, "are played with some difficulty, as the keys require to be struck with considerable force before the bells will give forth their true full sound; and in consequence of the player possessing no power to stop the vibrations of each bell, the notes of one passage perpetually run into another and become so inarticulate and confused as to occasion a very disagreeable jargon,

> "Like sweet bells jangled, out of tune and harsh."

In fact, no plan of ringing bells can be considered so entirely appropriate to their peculiar kind of harmony as the old English plan of peal-ringing and musical changes.

The antiquity of the custom of bell-ringing, by means of a rope, is undoubted; for in this way the single bells in our old churches were rung; but the date of the introduction of peal-ringing—that system of ringing by peals or numbers, which, while it brings out the true tone of the bells in a succession of musical notes, is managed with mechanical precision—is unknown. The first peal of bells, of which we have any reliable account, is that peal of five bells which was presented to King's College, Cambridge, by Pope Calixt III., in 1456. From that period, the placing of several bells in the towers of churches became more common; but it was not till the middle of the sixteenth century that peal-ringing became reduced to an art. Parnell gives the following account of the probable invention of these changes:—"The earliest artist and promoter of change-ringing of whom we have any account, was Mr. Fabian Stedman, born in the town of Cambridge, 1631. He introduced various peals on five and six bells, and printed them on slips of paper—being by profession a printer. These being distributed about the country, were soon brought to London, but what progress the art has made in the metropolis at this time* does not appear. The society of College youths,† in the summer of 1657, on a visit to Cambridge, were presented by Mr. Stedman with his peculiar production on five bells, since called Stedman's principle, which was rung for the first time at St. Benet's, Cambridge; and afterwards at a church on College Hill, Doctor's Commons, London, where the society at that time usually practised, and from meeting at which place they obtained that name. It appears from this account that change-ringing must have been earlier than 1657; as, before those curious and cross-change peals were discovered, single changes were universally practised; *i.e.* only changing two bells at one time; whereas, the improved plan of double and treble changes, &c.,—namely, every bell to change at one time—appears to have taken place long before 1657, by Mr. Stedman having produced such a complex method of ringing as his principle. In 1668, he published a book entitled 'Campanalogia, or the Art of Ringing;' which, before 1680, had gone through three editions."

This work is still considered the standard authority on the subject; and, if we come to consider for a moment, we shall soon discover what an infinite variety of sounds may be produced by the judicious *changes* which may be rung upon an octave or diatonic peal of eight bells. If we take three bells merely we shall perceive by the following arrangement that six changes can be rung upon them:—

1	2	3
1	3	2
2	1	3
2	3	1
3	2	1
3	1	2

Four bells can in the same manner be shown to ring four times as many changes as three, viz. twenty-four; five bells, five times as many as four, viz. a hundred and twenty; six bells, six times as many as five, viz. seven hundred and twenty; seven bells, seven times as many as six, viz. five thousand and forty; and so on. And in this way it has been calculated that it would take ninety-one years to ring the changes upon twelve bells, at the rate of two strokes to a second; and to ring the full changes upon a peal of twenty-four bells, would occupy, at the above rate, the trifling period of a hundred and seventeen thousand billions of years!

Although peals of ten and twelve bells are often hung, those of five and eight are much more common. We have mentioned that the business of bell-founding has existed in the Mears' family for more than half a century: during this time they have cast—besides the great bell already mentioned, and a set of hour and quarter bells for the Queen at Osborne-house—no fewer than—

	CWTS.
10 Peals of 12 bells each, weighing in the aggregate	350
28 Peals of 10 bells each	900
175 Peals of 8 bells each	2500
260 Peals of 6 bells each	2750
80 Peals of 5 bells each	400

But, in addition to the above, there have been cast at this establishment, up to the present time, including bells of four hundred weight and upwards, with chimes added, no fewer than two hundred thousand single bells—an amount of work of this kind unprecedented, perhaps, by any other founders in the world. In the above enumeration, moreover, no account has been taken of the almost innumerable number of hemispherical and conical bells, clock-spring gongs, musical hand-bells, railway, postman's, dustman's, house, sheep, dinner, and latten bells, constantly in course of manufacture; carillons, and various other descriptions of harmonious combinations of this ancient and beautiful kind of music. Who that possesses, as Cowper has it, a

> "Soul in sympathy with sweet sounds,"

can listen unmoved to

> "—— The music of the village bells
> Falling at intervals upon the ear
> In cadence sweet,—now dying all away;
> Now pealing loud again, and louder still,
> Clear and sonorous as the gale comes on."

"Bell," goes the old German song, "thou soundest merrily when the bridal party to the church doth hie; thou soundest solemnly when, on Sabbath morn, the fields deserted lie; thou soundest merrily at evening, when bed-time draweth nigh; thou soundest mournfully, telling of the bitter parting that hath gone by! Say, how canst thou mourn or rejoice that art but metal dull? And yet all our sorrowings and all our rejoicings thou art made to express!" In the words of the motto affixed to many old bells, they "rejoice with the joyful, and grieve with the sorrowful;" or, in the original Latin,

> "*Gaudemus gaudentibus,*
> *Dolemus dolentibus.*"

An old monkish couplet, quoted by Henry Spelman in his glossary, makes the bell thus describe its uses:—

> "*Laudo Deum verum, plebem voco, congrego clerum:*
> *Defuncto ploro, pestum fugo, festa decoro.*"
>
> "I praise the true God, call the people, convene the clergy;
> I mourn for the dead, drive away pestilence, and grace festivals."

We will conclude with some account of

A FEW CELEBRATED BELLS.

China has been celebrated for its bells; but the Chinese bells have all the old saucer form. In the sixteenth century four great bells were cast and erected at Nankin, the largest of which weighed, it is said, not less than 50,000lbs., and was twelve feet in diameter at its base. The weight of the bells brought down the tower in which they were hung. At Pekin there were seven bells of enormous dimensions. One of these is described by Magaillans as weighing no less than 120,000lbs.,

* Thomas Parnell was a poet and writer in the beginning of the eighteenth century. He was the associate of Addison, Steele, Pope, Gay, and Arbuthnot, and contributed several amusing papers to the *Spectator*, *Guardian*, &c.

† This appears to be the most ancient society of ringers. They are said to have been established in the sixteenth century, and a book containing the memorials of that society in the sixteenth and seventeenth centuries, after escaping the ravages of the fire of London, has been unaccountably lost. It is not improbable, however, that several copies exist among the *waste* of the public libraries; and whenever that *waste* comes to be fully examined, we may naturally expect many prizes to turn up.

and has a height of 12½ feet, a diameter of 13½ feet, and a circumference of 42 feet. They are used for denoting the five watches of the night; but we learn from the author of "China, and the Chinese," that they are now out of repair.

Russia, among the countries of Europe, is the one most celebrated as possessing enormous bells; at Moscow, in particular, there are bells of most enormous size. The largest of them has been described by Dr. Clarke as a mountain of metal, and is termed by the Russians the "Tsar Kolokol," or King of Bells; and from the metal of which it is composed, it is said that thirty-six bells as large as the great one in St. Paul's could be cast. In the tower of St. Ivan's church, Moscow—says Mr. Gatty—there is a bell weighing 127,836 English pounds. The largest bell in Russia, however, is that described as the King of Bells. It is the largest in the world, and is said to weigh 443,772lbs. The height of this bell is 21 feet 4½ inches; its circumference, ten feet above the extremity of the lip, is 67 feet 4 inches; its diameter is 22 feet 5⅓ inches, and its greatest thickness 22 inches. It is said to have been given to the Russians by the Empress Anne, and its value in money, merely as old metal, is estimated at £66,565—an immense sum to lie uncirculated and waste, for the bell has never yet struck a note. This monstrous mass of metal was for nearly two centuries allowed be partially buried in the sand of the pit in which it was moulded—an object of wonder to the traveller and of deepest reverence to the natives, who visited it with pride at their festivals, and were extremely jealous of its being touched or measured by strangers.

The tones of the bells of Russia are said to be very fine. That one already spoken of as being hung in the tower of St. Ivan's church, is said to produce, when sounded, a tremulous effect which is felt all over the city.

The following are the reported weights of some of the most celebrated bells in the world:—

	TONS.	CWT.	QRS.	LBS.
The great bell at Moscow	198	2	1	0
The bell in the tower of St. Ivan's Church, Moscow	57	1	1	16
Another bell in the same church	17	16	0	0
Another, cast in 1819	80	0	0	0
The great bell at Pekin	53	11	1	20
One at Nankin	22	6	1	20
One at Olmutz	17	18	0	0
One at Vienna, dated 1711	17	14	0	0
One at Paris, placed in the cathedral in 1680, twenty-five feet in circumference	17	0	0	0
One at Erfurt, in Germany, and considered to be of the finest bell metal extant	13	15	0	0

FIG. 9.—THE TUNING ROOM AND TUNING MACHINE.

"Great Peter," at York Minster, which cost £2,000, and was erected in 1845	10	15	0	0
Great bell of St. Paul's, which originally weighed 3 tons 13 cwt. 3 qrs. 1 lb.	5	2	1	22
"Great Tom," at Oxford	7	11	3	4
"Great Tom," at Lincoln	5	8	0	0
"Dunstan," at Canterbury	3	10	0	0
The great bell at Montreal	13	10	0	0
Another at Montreal	7	6	0	0

The latter two large bells were cast by the Messrs. Mears, who also recast the Great Peter of York, the Great Tom of Lincoln, the Dunstan at Canterbury, and the peal of bells in the tower of the Royal Exchange. These last bells have lately been recast in consequence of the works of the clock, built by Mr. Dent, not being sufficiently powerful to move the chiming apparatus in a proper manner.

JOHN HAMPDEN.

HERE are some men's memories which become sweeter every ge. In their own times they were not done full justice to, ey were by many misunderstood, unjustly censured and aligned. But as time passes away they become better understood. The world sees their real worth. Men praise what before was blamed. Our fathers stoned the prophets, and we build their sepulchres.

Hampden is to some extent an illustration of this. He lived in stirring times—in times when men fought for freedom—when it was as dear to them as a cash-box is to us—in times, when it seemed as if liberty were to be for ever exiled from our land. The limit between the power of the people and the crown had not been fairly defined, and the sceptre had passed into the hands of a man who did not, or could not, see that the people had become sturdier and stronger than they were, and that it was in vain he attempted to use the

HAMPDEN MORTALLY WOUNDED ON CHALGROVE FIELD, JUNE 18, 1643.

arbitrary power which had been permitted to Elizabeth or her imperious sire. The consequence was a struggle—a civil war, followed by his untimely end. But the time was favourable for the development of heroic character. Especially was this the case on the part of the parliament. Some of these leaders bear the brightest names in English story. This is emphatically true of Hampden; yet, after all, we know but little of him.

Hampden was born in London in 1597. He came of an old and honoured family. Far back in the time of the Black Prince we have a rude tradition to the effect, that

> "Gruig, Wuig, and Ivanhoe
> In striking of a blow,
> Hampden did forego,
> And glad he could escape so."

He was educated by Richard Bouchier, master of the Free Grammar-school of Thame. He then became a commoner of Magdalen College, Oxford, and shortly after we find him at the Inner Temple, where, according to Clarendon, whose character of Hampden is to be taken with some suspicion, he did as many cavaliers had done before him, in leading a life "of great pleasure and license." If this is the case, we have plenty of evidence to show that Hampden was all the while a diligent student, and at no time could he have become so absorbed in dissipation as to be alienated from domestic scenes; for in 1619 we read of his marrying, at the church of Pyston, Oxfordshire, Elizabeth, daughter of Edward Symem, Esq., lord of the manor of that estate. We have evidence to show that he was warmly attached to his wife, by whom he had a large family; still, that attachment by no means unfitted him for public life, as we find him returned to parliament, for the borough of Grampound, shortly after. Some enter on public life for selfish purposes; many of Hampden's contemporaries thought it no disgrace to trade. Even Hampden's mother would have had her son thus distinguish himself. In a letter of hers, published by Lord Nugent, she says, "If ever my sonn will see for his honor telle him now to come; for heare is multitudes of lords a making—Viscount Mandeville, Lo. Thresorer, Viscount Dunbar, which was Sr. Harry Constable; Viscount Falkland, which was Sr. Harry Carew; these two last of Scotland; of Ireland divers—the deputy a viscount, and one Mr. Fitz-William a baron of England, Mr. Villiers a viscount, and Sr. Will. Fielding a baron. I am ambitious of my son's honour, which I wish were now conferred upon him, that he might not come after so many new creations." Hampden could forego such poor and paltry honours. No king could have conferred on him a name greater than that he won for himself. To have been a lord would have been no addition to Hampden's real glory. Fortunately he resisted the voice of the charmer, and instead of having a coronet upon his brow, fame has placed there a wreath of evergreen. He stands like a star apart, the purest patriot of that stormy time; and yet great men lived then. Sir Edward Coke, the great oracle of English law; Selden, the wonder and admiration of his contemporaries; Pym, the bold and eloquent leader of the House of Commons, were his friends and fellow-workers; while Strafford was being hunted to his tragic fate. Oliver Cromwell was something more than a friend. He and Hampden were cousins. Had Hampden lived, Cromwell never could have prospered in his ambitious designs. The office of the Lord Protector would have been needless. At any rate, the republic would have had a better chance.

In the first parliament of Charles, Hampden was the originator of what was called Granville's committee—a committee appointed by the house to decide as to the right of the boroughs of Marlow, Wendover, and Amersham to return burgesses to parliament, and at the same time to inquire into the powers of the house to legislate on such matters. Hampden succeeded in establishing the rights of the boroughs, and the independence of the house. His next public act was equally creditable. Charles was needy and wanted money; the house kept him poor, for if he had been rich, he would have trampled the nation's liberties under foot; consequently, Charles had recourse to loans. One of the parties applied t was Hampden. His answer was, "That he would be conter to lend as well as others, but feared to draw upon himse that curse in Magna Charta, which should be read twic a-year, against those who impugn it." The answer was dis pleasing to the king, and the result was, that Hampden wa committed to the Gate-house for a time. Of course, this onl strengthened Hampden's attachment to the popular party and when Charles's third parliament met, he took a leadin part on all questions relating to privilege, religion, or th supplies—the question for which men then were ready to la down their lives on the scaffold, or at the stake—and took par in the preparation of the Bill of Rights. Darker and stormie times came. Sir John Glish was sent to the Tower, there t linger out the last few years of a noble life, and Hampde undertook the care of his compatriot's sons. At thi time we hear but little of him. He was taken up witl private duties, and with studies worthy of a statesman Danilas' "History of the Civil Wars of France" was con stantly in his hands. In the language of Sir Philip Warwick it was his *vade mecum*. Hampden had a larger vision tha most men. He saw clearer than others the inevitable struggl and the necessity of the appeal to arms. He would hav averted that struggle if he could, but failing to do so, his onl care was, as to how he should shape his course, so as t preserve the nation's liberties unhurt. The time now came fo him to put himself in action. In the autumn of 1635, demand was made upon Hampden for ship-money, he refuse to pay it. That refusal occasioned him considerable incon venience and immense expense. He had to put himself i collision with the crown, with unscrupulous lawyers, witl judges but too ready to convict. Hampden, however, was no to be daunted. He entered on the contest with a spirit tha no obstacle could overcome. He retained counsel of no ordinary ability, and he kept the case constantly before the public eye. The result was, that when the sentence in form was delivered in favour of ship-money, by the timid and time-serving judges, the sentence against it was emphatically de nounced by a great majority of the people of the realm from one end to the other. The commons voted the demand illegal and five of the judges were impeached. Hampden alone triumphed in this affair. The great historian of the othe party, the courtly Clarendon, was obliged to confess, that the judgment that was "given against him infinitely more advanced him than it did the service for which it was given. He was rather of reputation in his own county, than of public discourse or fame in the kingdom, before the business of ship-money; but then he grew the argument of all tongues, every man inquiring who and what he was, that durst at his own charge support the liberty and property of the kingdom, and rescue his country, as he thought, from being made a prey to the court."

Hampden, as member for his own county, Buckingham-shire, assumed a more energetic part. Charles had madly invaded the House of Commons, and demanded that five members, of whom Hampden was one, should be given up. Hampden now felt they could no longer trust the king. "His nature and carriage seemed," says Clarendon, "much fiercer and haughtier than before." He became a root-and-branch man; he drew his sword, and threw away the scabbard. Charles left his capital, never to return to it as a king. The parliament raised an army. The earl of Essex was appointed its commander. Hampden became a colonel, raised a regiment of infantry, and subscribed two thousand pounds for the expenses of the war. Every regiment had an appropriate motto. That for Hampden's green-coated Germans showed the determined spirit of the man. It was short, but plain:—"Vestigia nulla retrorsum." Alas! of that appeal to arms, Hampden witnessed but little. The Earl of Essex, the parliamentary general, allowed the first campaign to terminate without gaining any decisive advantage. Essex was not the man qualified to take the lead in perilous times. The idea was entertained at one time of putting Hampden in his place. Had that idea been carried out, Hampden might have been saved his

ntimely fate. And yet he could not have had a more glorious eath. He died a patriot—died a martyr for the truth of God nd the freedom of man.

In the month of June, 1643, Hampden set out with a party f volunteers in pursuit of Prince Rupert, who had attacked a ortion of the parliamentary army in the neighbourhood of Vycombe. We cannot describe the melancholy scene which llowed, and which is so effectively depicted in our engraving, ı more appropriate language than that employed by Macaulay, ıe brilliant historian, in one of those Critical and Biographical ssays which are the theme of universal admiration.

"Hampden had, on the preceding day, strongly represented) Essex the danger to which this part of the line was exposed. ıs soon as he received intelligence of Rupert's incursion, he ent off a horseman with a message to the general. The cava- ers, he said, could return only by Chiselhampton bridge, force ought to be instantly despatched in that direction for ıe purpose of intercepting them. In the mean time, he re- olved to set out with all the cavalry that he could muster, or the purpose of impeding the march of the enemy till Essex ould take measures for cutting off their retreat. A consi- erable body of horse and dragoons volunteered to follow him. Ie was not their commander. He did not even belong to their ranch of the service. But 'he was,' says Lord Clarendon, second to none but the general himself in the observance and pplication of all men.' On the field of Chalgrove he came up ith Rupert. A fierce skirmish ensued. In the first charge, Iampden was struck in the shoulder by two bullets, which roke the bone, and lodged in his body. The troops of the arliament lost heart and gave way. Rupert, after pursuing ıem for a short time, hastened to cross the bridge, and made is retreat unmolested to Oxford.

"Hampden, with his head drooping, and his hands leaning n his horse's neck, moved feebly out of the battle. The man- ion which had been inhabited by his father-in-law, and from hich in his youth he had carried home his bride Elizabeth, as in sight. There still remains an affecting tradition that e looked for a moment towards that beloved house, and ıade an effort to go thither to die. But the enemy lay in ıat direction. He turned his horse towards Thame, where e arrived almost fainting with agony. He wrote from is bed several letters to London concerning public affairs, nd sent a last pressing message to the head-quarters, re- ommending that the dispersed forces should be concentrated. When his public duties were performed, he calmly prepared imself to die. He was attended by a clergyman of the hurch of England, with whom he had lived in habits of ıtimacy, and by the chaplain of Buckinghamshire Green- oats, Dr. Spurton, whom Baxter describes as a famous and xcellent divine."

Some few things he said have been preserved. We repeat hem here. "Though he could not away with the govern- nce of the Church by bishops, and did utterly abominate he scandalous life of some of its clergymen, he thought ts doctrines, in the greater part, primitive, and conform- ble to God's word as Holy Scripture revealed." As his ife grew shorter, his conversation became more devout. His last moments were spent in fervent prayer. "Oh Lord God of Hosts, great is thy mercy. Great and holy are thy dealings with us sinful men. Save me, oh Lord, if it be thy good will, from the jaws of death! Pardon my manifold transgressions, and, Lord, save my bleeding country. Con- found and level in the dust those who would rob the people of their liberty and lawful prerogative. Let the king see his error, and turn the heart of his wicked councillors from the malice and wretchedness of their designs. Lord Jesus, receive my soul! Oh Lord, save my country! Oh Lord, be merciful to——" The sentence was never finished. The next moment Hampden was no more. Far and near men wept as they heard the melancholy news. Never was a great leader cut off more inopportunely. Clarendon tells us his death "occasioned as great a consternation to his friends as if their whole army had been defeated and cut off." They buried him by the side of his heir, where the bones of his loved ones lay. They gave him a soldier's funeral. With arms reversed and muffled drums the troops followed his body to the grave. As they went, they sang how God had been his dwelling- place in all generations. As they returned, they sang the forty-third Psalm.

Hampden died, but the cause to which he had devoted his life lived. He left behind men of the same true spirit and glorious aim. His name is a watchword still. When the men of England have to be invoked—when "the good old cause," as Sidney, who died for it on the scaffold, termed it, is in danger, they are told

> "Yours are HAMPDEN'S, Russell's glory—
> Sidney's matchless shade is yours,
> Martyrs in heroic story,
> Worth a thousand Agincourts."

We conclude with a summary of Hampden's character. Sir Philip Warwick testifies to his great knowledge both of scholarship and law. If we turn to the pages of Clarendon, and make allowances for the partisanship of the writer, we shall see Hampden was one of the noblest spirits of the age. He possessed great judgment, knowledge, and discretion. He was modest, cheerful, courteous, free from the least taint of overbearing and arrogance. He commonly spoke last, and what he said left nothing to be said further. He was not merely a man of thought, but of action as well. He shone as much in the field of battle as in the council-chamber. He was as full of courage in the midst of his foes as he was when surrounded by his friends. In everything we find him saga- cious, of consummate address, of noble bearing, of persuasive manner, everywhere versatile and finished—a gentleman, a scholar, a soldier, and a saint. Men felt the cause which en- listed Hampden on its side could be no unworthy one, that it must have truth and justice. "His affections," says Claren- don, "seemed to be so publicly guided, that no corrupt and private ends could bias them." . . . "He was," as the same writer observes, "possessed with the most absolute spirit of popularity and the most absolute faculties to govern the people of any man I ever knew." All men looked to him as a beacon in those days of darkness and trouble. The eyes of all were fixed on him—we repeat Clarendon again—"as their patriæ pater," as "the pilot which must steer the vessel through the tempests and rocks which threatened it."

PALACES OF THE GRAND CANAL AT VENICE.

WHEN a traveller arrives at Venice and has only two hours to pend there, the best plan for him to adopt is to devote the irst to the Grand Square of St. Mark and the Ducal Palace; nd the second, to the Grand Canal and its palaces. One ıundred and twenty minutes is but a short visit to the City of he Sea, but it is sufficient to crowd the mind with the mar- ellous and the poetical, and to give one something to think bout for a lifetime. To descend the sea-washed steps of a tately palace, to enter a sombre-looking gondola, to dart rough the single arch of the Rialto, to look upon the church the Santa Maria della Salute, to gaze right and left on the long array of noble edifices—every mansion fit for a king—to do all this, though it be but for an hour, awakens old memories that have long lain asleep, and imparts thoughts, and feelings, and associations which were never ours before. Floating down the Grand Canal, one cannot help noticing the endless variety of architecture on either side. Old Arab art contrasts with that of the Renaissance—Gothic windows, marble steps, pro- jecting figures, rows of colossal masks, chimneys of all shapes and sizes, balcony above balcony, cupolas without number—all mingled together in a thousand varied forms, presenting such a picture as Venice only can present.

The engravings which we give represent the old style of Venetian architecture—the Arabic or Saracenic. These palaces have excited the interest and curiosity of every European traveller. The palace Pisani was built at the beginning of the fifteenth century, close by the palace Barbarigo. Within it is preserved the picture, by Paul Veronese, representing "The Family of Darius at the feet of Alexander." The Ca' Dora is a specimen of Grecian and Arabian architecture. The name signifies not Golden House, as some authors assert, but House or Palace of Dora, from Dora, a jurisconsul of the twelfth century.

Now, there are two ways of regarding these palaces, and all the palaces and sights of Venice. They may be looked upon in a very practical light; and then the city is little better than a dead swamp, out of which towers, and domes, and houses have sprung; a city of raised quays, dirty boats, dirty crews, and dirty water of a yellow-brownish hue. And there is the thing seen elsewhere. You enter the Rialto, and expect meet Antonio and Shylock, to see the lordling spit on t Jewish gaberdine, to have re-enacted the old story of t pound of flesh; or, walking through the silent streets, floating over the silent canals, you look for Priuli's palace your mind is filled with thoughts of the gentle Desdemona and you look for the place where Othello addressed the sena Or the glory of Venice comes back — her merchant-princ once more to stir within her streets—the doge enters the ma nificent Bucentaur, covered with gold from prow to stern, a sails out into the Adriatic to wed the sea, to throw the mystic golden ring into the waters, and to say, "We marry thee, Sea, in token of that true and perpetual dominion which t republic has over thee!" Or some of its darker legen are awakened. Palaces of more than eastern splendour, a prisons of unutterable woe. Maskings and feasts of wondro hilarity, and deeds of darkness and terror enough to make t

THE PALACE PISANI, ON THE GRAND CANAL AT VENICE.

romantic, poetical aspect—the one more universally adopted. Then Venice appears, like the palaces in old Arabian stories, to have been raised by an enchanter's wand. Everything is wonderful and brilliant, there is a charm over the silent city, every mansion is elegant and noble; and the heart is touched by every golden façade, by the variegated colours of the pavements, by the Asiatic carpets, the splendid costumes, the patrician luxury, the songs, the movement, the life of the city. As you walk the grand square of San Marco, a kind of awe comes over you; those long piazzas of gold and opal, so fantastically sculptured with grapes, and birds, and pomegranates, and lilies, and angel forms, cannot be looked upon without emotion; and the glittering pinnacles and the white arches, that rise up in a confusion of delight, exercise a magical influence over you. The cathedral itself, lifting its gigantic form, doves nestling among its marble foliage, is unlike anything boldest tremble; every dungeon has its story, every dee lagoon its buried secret. The Marani, or murder-hole of th Adriatic, is a forbidden spot to fishermen even to this day.

But in spite of all the poetry and romance which clothe th city, as with a poetic vesture, there are a certain class o tourists to whom it is all barren. They talk about its practica appliances, condemn its houses, quays, and bridges, sugges sanatory reforms, declare that the palace of an admiral, a sena tor, or a doge is not half so good as a respectable hotel; the express great indignation with poets, painters, and guides protest that the city is not what they expected; vote Beckfor and Byron mere writers for effect, who had no business to g meandering over Venice, sighing over its fallen glory, an picturing it as a very Eden, and making quiet people at hom envious of things which had no real existence. For this clas of travellers, a Swiss hostlery, an English inn, an America

arm-house has a more brilliant appearance, and is liked a great deal better; it is more in harmony with their thoughts nd feelings, more consonant to their predilections, being ecidedly more comfortable.

These old palaces belong to the past. They are not things o be swept and garnished, and made modern. In their olemnity and silence they are the monuments of the ancient lory of the city, of the art of those who reared their stately iles, of the grandeur of those who dwelt within their walls. ttempts have here and there been made to adapt the antique plendour of the mansions to the usages of modern opulence, nd huge has been the failure of the result. Patched, and ainted, and "done-up," the grandeur departs for ever, the pell is broken, the charm is gone. Suppose a hardy speculator f that genus, with which our age abounds, promise to restore new the Ca'Dora, the palaces of the Foscari, Contarini, Pisani, rimani, Manin, Sagredo, Vendramin, and others less illustrious; imagine all these monuments of the old time modified and altered, and re-arranged according to modern notions and the conventionalities of life in the nineteenth century—what would be the result?—a thing of shreds and patches, a hybrid, neither ancient nor modern, as incongruous and out of place as harlequin's hat on the head of Augustus.

Venice derives no interest from classic association. It has an antiquity of its own. Of all modern things it is the oldest —of ancient things the youngest born. He who boasted that the grass grew not where his horse had trod, chased into glory and renown the Venetian people. Driven before Alaric to take shelter in the small islands of the Venetian Gulf, they,

> "Like the water fowl,
> Built their nests among the ocean wave,"

and Venice became the richest and most magnificent city in Europe. How the city fell, it is unnecessary here to relate.

THE CA' DORA PALACE, ON THE GRAND CANAL AT VENICE.

VARIOUS TRIBES OF THE HUMAN RACE.

We herewith take occasion to present the reader with a few pictorial representations of men;—men not celebrated as individuals for any peculiar virtue or startling vice, but whose claim to our editorial attention, and to the reader's best consideration, is founded on the truthful representation of the races to which they belong.

Need we stop to indicate the races or nations to which the six interesting individuals represented in our first illustration (p. 304) appertain? Perhaps it is scarcely necessary; yet, for fear of accidents, we will do so, beginning with the most important (looking) personage in the united happy family. There he is in the centre of our picture; standing proudly erect, as a celestial should, looking with great complacency on his own figure—but scorning to deign a glance at those around him. A very fitting exposition of the idea John Chinaman entertains of himself is given by our picture. He is a man one would object to buy at his own price; and his long flag-ornamented spear looks sufficiently formidable. Nevertheless, John Chinaman is no great soldier—nay, if the truth be told, he is somewhat of a coward; had he read our own "Hudibras" he could not have entertained notions more discreet about "running away, that he may fight another day." Placed in the centre of our group, amidst so many warlike neighbours, the brother of the moon must be ill at his ease. Immediately on the right (*his* right we mean, not the reader's) is his warlike neighbour, the Japanese, whom we might recognise anywhere by his open vest and petticoats, of which latter we may say more hereafter.

Nothing offends a Japanese so much as a comparison between him and the Chinese. "The only time," says Dr.

Ainslie, "I ever saw a Japanese forget his usual politeness was on an occasion of this kind. Inadvertently I happened to draw a comparison between him and a Chinese, when he knit his brows, looked sternly at me, and laid his hand upon his sword." Nor is this superiority assumed without justice. The Japanese have ever known how to protect their hearths and homes against all invaders. The last serious attempt on their liberties was made by the grandson of Genghis Khan, who, after a strenuous effort, was utterly defeated.

Squatting at the feet of the Japanese, we have the muck-running Malay. On the extreme left of the picture we have another spear-bearing gentleman, who is an Arab, and behind him a rather spruce-looking Oriental, in high cap and shawl-pattern dressing-gown. This latter individual is the greatest rogue of the party, and having stated thus much, we need scarcely say he is a Persian. Like the other individuals of our group, the Persian is not a certain individual Persian—he is any Persian you like, kind reader—but being the only Persian in our wood-cut, he is the greatest rogue there.

Of the Persians, we shall merely inform the reader that they are a mixed race; that their native country is known to them by the name of Iran; that they are cruel, treacherous, false, possessing a fine language, and tolerably poetical literature; but their historical records are so completely lost, that all knowledge of their former struggles with classic Greece has vanished. The earliest and most authentic account of the manners and customs of the Persians is to be found in Herodotus.*

We must now bid adieu to the native of Japan, and devote a few words to his pictorial—nay, almost his geographical neighbour, the Malay. It is rather a curious circumstance that naturalists are at a loss to account for, or classify, the Malay. If we are to believe in the historical records of that people, the Malays originally came from the district of Palembang, in the interior of Sumatra, and distributed themselves, about the end of the twelfth century, over various littoral regions of neighbouring lands. Connected with this history, it may be mentioned as not a little singular that the centre of Sumatra has a Malay population to this day, and is the only inland spot thus circumstanced. The Malays have always been bold, resolute mariners, and in all their wanderings have never penetrated far inland. They are an impetuous, daring race, prone to anger, sullen and implacable. Their revenge knows no bounds, their dissimulation is equal to their revenge. A Malay, once offended, is implacable. He may appear to forgive, but only awaits a favourable occasion. So soon as this occasion presents itself, he maddens his intellects by a dose of opium, and breaking loose, with creese or crooked dagger in hand, stabs all who oppose his progress—calling out all the time, "*amok, amok*," which means, "kill, kill." In every mental characteristic, the Malay is the very antipodes of the Hindoo. Until 1276, the Malays were pagans, or adopted some form of Hindoo idolatry; they then adopted the tenets of Islam, which is at present the universal faith.

We have little to say about the Chinese beyond what the reader knows of him already. China, indeed, has ceased for some time to be that *terra incognita* it was formerly represented. Various travellers have within the last ten years penetrated into the celestial regions, and made notes of what they saw. Amongst all these recent books of Chinese travels, that of Mr. Fortune, the horticulturist, is one of the most instructive and interesting. We have spoken of the cowardice of the Chinese, a quality which is amusingly illustrated by Mr. Fortune, who very amusingly relates how—though ill of fever at the time—he succeeded in beating off two Chinese pirate ships with a double-barrelled fowling-piece. The movement now going on in China will probably work a mighty change in the destiny of this populous empire.

Last of all comes the noble Arab, remarkable as being of the race whence sprung the soldier prophet Mohammed. The Arab is amongst the finest specimens of Caucasian man, a the wonderful success of the race under the first Caliphs unprecedented. To the Saracen Arabs of Spain we indebted for the introduction of algebra to Europe, for t method of measuring angles by sines instead of the chords arcs, for the introduction of sugar, and of a fine description pottery,* with numerous arts and sciences which would occu whole pages in the mere enumeration. We have neither tir nor space for this, but must take leave of our interesti group.

Amongst all the figures represented in our second woo cut (p. 305), that on the extreme left of the picture clain pre-eminence. Not only on account of actual changes no taking place, and the Eastern political movement, is t Turk interesting to us, but for many other reasons. Viewe without prejudice, he is a very noble fellow, mentally a corporeally. His physiognomy is scarcely inferior in beau to the Hellenic type, from which, however, it differs in ma essential respects. Nevertheless, according to many nat ralists, the Turk is not originally sprung from a Caucasia race; and even Cuvier, who concedes to him this privileg honour, ranges the Turks' forefathers amongst the very uglie of that race the Scythian and Tartar branch. Why, then, may be inquired, are the modern Turks so handsome as general rule? The only reason that can or need be assigne is the intermarriage of their ancestors with a race mo favoured by nature than their own. This cause having bee in operation for centuries, has no doubt mainly contributed the improvement of which we speak, and the result is, th the modern Ottoman now possesses more than half the ch racteristics of the Caucasian race. A still more strikin instance of the gradual change in the aspect of a race b intermarriage is recognisable in the isolated valley of Cash mere. The beauty of the inhabitants of this valley is als celebrated. The natives are now very fair, although originall of Hindoo stock. This fair complexion, and, in short, all th difference between a Hindoo of the valleys and a Cashmeria is attributable to intermarriage with Circassian girls.

The original seat of the Turkish race is the Altai moun tains, situated in the very centre of Asia. The race that people was servile, being amongst the most despise of the slaves of the Khan of the Geougen. Their appointe task was the extraction of metals from their ores and th manufacture of arms—a dangerous profession for slaves t be taught. At length a leader arose amongst the Turks his name was Bertezena. He led them against the neigh bouring tribes and to victory. Having signalised his prowes by feats of arms, Bertezena presumed to ask in marriag the daughter of the Khan, when the father contemptuousl rejected him. The Turkish leader thereupon forthwith allie himself with a princess of China, and having almost ex tirpated the tribes of the Khan of Geougen in battle, esta blished in its place the more powerful empire of the Turks From this time the conquests of the Turks were rapid an extensive. Pressing on westward, they at length were brough into collision with the Eastern empire of Byzantium, alread tottering to its fall. At length, in 1453, the Eastern empir fell, that of the Ottoman taking its place. The event, it wil be seen, happened exactly 400 years ago, and the Russian having been long accustomed to predict the downfall of Turk ish domination at the expiration of 400 years, a peculiar sig nificance was imparted to the year 1853.

The Turks, from being originally idolaters, espoused, at very early period of their career, the tenets of Islam, as th head of the orthodox or Sunnite division, of which they ar universally recognised. Persia, as most likely the reader i aware, belongs to the opposed or Shüite sect of Mohammedans and for this reason the feeling between Persian and Turk i none of the most friendly. Certain modern journalists affec to marvel at the circumstance that Persia should appear t have thought of taking the field against her co-religionist forgetting that, in proportion as the distinction betwee

* For a translation of this part of Herodotus, see the HISTORICAL EDUCATOR, Vol. I. No. 11., pp. 161—8.

* The "Majolica ware."

cts is more slight, so frequently, if not invariably, is the utual antagonism more intense. In addition to mere octrinal points of difference, the Turk and the Persian are essentially different in their whole moral constitution, that ry little community of feeling could be expected to exist tween them. Veracity is no less a characteristic of the smanli than falsehood of the Persian. The Turk's plighted ord is never broken—that of the Persian is seldom kept. he Turk is thoughtful, impassive, sedate: the Persian is isy and vivacious. To sum up all, the Turk is a thorough ntleman from toe to turban, and the Persian every inch of im a scamp.

Standing next to the Turk in our illustration is an individual ith cloak hanging on one shoulder and peculiar brimless hat. his individual is a Magyar or Hungarian. True to his prinples of faithful delineation, our artist has represented the lagyar with the peculiar nose, so characteristic of his race, at it has passed into the proverbial terms of *Hungarian nose*. he peculiarity consists in a sort of aquiline stumpiness not together agreeable, especially in the fair sex. The present lagyar or Hungarian race of men has sadly puzzled the hnologist. What region they came from, or who they were, person seems to know. Cuvier ranges them under the cythian or Tartar group of Caucasians, along with Turks, ins, and Parthians; but this is by no means certain. The lagyars themselves are fond of tracing their origin to the uns, and are so proud of Attila, their assumed progenitor, that e picture of that arch destroyer is to be seen in the house of most every Hungarian. Nevertheless, there seems to be no st reason for crediting this parentage. The Magyar language also involved in great mystery as to its origin and congeners, t no difference of sentiment exists as to its powers or pressiveness. Anterior to the year 1828, all Hungarian gal documents were drawn up in Latin, which also was the nguage of polite conversation amongst the better classes. ince that period the Magyar or Hungarian language has been troduced into courts of law, and has been cultivated by all asses as the literary exponent of the nation. This sudden evelopment of the native language, under the auspices f Kissfaldy and other Hungarian poets, was but one of any indications betokening reviving nationality. Hungary, though absorbed, so to speak, in the fabric of the vast ustrian empire, had still a government—a constitutional overnment of her own, the enactments of which were ever lashing with those of the imperial power. The results of this lashing between adverse interests we have already seen in the olitical commotions of 1848-9. Recently, Hungary has been ompletely absorbed (at least by decree) into the Austrian mpire.

In appearance, the Magyar is still half oriental; in temperment, he offers certain points of comparison with ourselves, eing a sort of impetuous, military Anglo-Saxon, fond of conitutional government, prone to litigation, and preferring the ough enjoyment of independence to any reliance on the avours of a government; in which latter respect he presents alient points of contrast to his neighbour the German, who, ith all his intellectual pre-eminence, is never happy except he lls some office under a government and enjoys a high-sounding ame. Reverting to the subject of the Magyar language, its ost striking phonetic quality is the preponderance of the tter K. This quality has been remarked by all strangers ho have heard it spoken, and has been rather amusingly ommented upon, as the reader will, perhaps, remember, by iss Pardoe, in her book, entitled "The City of the Magyar."

Brave Magyar, we must bid you now farewell, and direct our ttention to your interesting right-hand neighbour, that pretty reek girl. As we point to the natives of Georgia and Circassia for our beau ideal of corporeal beauty; so, when the xtreme of intellectual expression is to be portrayed, do we eign or figure to ourselves the classic models of Greece.

And who were and are those Greeks?—that people who urnished models for the immortal chisel of Phidias and Praxiteles? Whence came they? Were they the prototype of the Greeks of the present day? All these are interesting questions, which we, in few words, will strive to answer. The most ancient histories and traditions of classic Greece testify to the mixture of races, out of which the Greeks of antiquity were consolidated. Throughout the Grecian continent and archipelago structures are still to be seen, termed "Cyclopean," very different to the beautiful temples hereafter destined to spring up in that land of genius. The Cyclopean structures possess somewhat the characteristics of our own Druidical monuments, being composed of enormous stones rudely aggregated without mortar. By whom—by what race were these structures raised? That is a mystery; but whatever the race, it existed in Greece anterior to the Pelasgic, of which the Celtic and the Latin were also branches. We all know that the Romans traced their origin to the heroes of Troy; so, in like manner, do the Celts also; but more indirectly did the Greeks; for call them Trojans, Pelasgians, Thracians, Phrygians, or any other equivalent name, Greece was colonised, subsequently to the Cyclopean period, by a people which gradually became absorbed into two dominant families—the Achaic and Hellenic.

From whatever elements compounded, no race on the face of the earth ever presented such an union between physical and intellectual beauty as the classic Greeks, and much of this beauty still remains to the present day. The Greek countenance presents a beautiful contour of skull and face, dark flowing hair, white skin, slightly tinged with olive or brown; large eyes, straight nose, falling directly, with only a slight depression between the eyes. Nevertheless, though slight, there is a depression; and in this respect the Grecian differs from the Turkish countenance, which, instead of a depression between nose and forehead, is marked in that spot with a slight elevation. There is something strange in the contemplation of that persistency of form, features, and language, which characterises Greece and its inhabitants. Notwithstanding a certain deterioration of aspect, traceable to the effect of conquest and prolonged slavery, the modern Greeks are still very handsome, and the style of their beauty is as of old—a proposition rendered sufficiently evident by a comparison of living specimens with antique statues. As to the modern Greek language, now called the Romaic, it is not more different from classic Greek than modern English is different from the language of Chaucer. In deference to a certain modern tendency, the nature of which it would be be impossible to explain, all the multifarious inflexions of ancient Greek have vanished from the Romaic, and tenses are formed by the help of auxiliaries, instead of by varying terminations; nevertheless, the two languages must be pronounced the same; indeed, the modern literati of Greece affect to write in the classic language, which still being generally taught in the native schools, the process of regeneration proceeds. Such, then, is the persistency of the Greek language: where is the Latin gone? Made of sterner stuff, apparently, than the Greek, it is now everywhere a dead language.

Returning to our little Greek damsel, it is a subject of regret with us that the Hungarian on the one side, and the Tyrolese on the other, do not permit her to come further towards us. Were she more visible, her garb would be seen to be highly picturesque. Every rose, however, the proverb says, has a thorn; and if our little Greek were nearer, we might perhaps discover her to possess larger feet than accord with our notions of feminine beauty. If the truth must be told, Greek ladies have not, and never appear to have had, little feet; nor is a high forehead one of their characteristics. The quality, however, of high forehead in ladies was not approved of by classic nations, and we happen to be acquainted with some moderns who participate in the sentiment. In point of fact, a high forehead is thought to correspond with strong-mindedness, and some people are so perverse that they cannot like "strong-minded women."

Whatever may be our regrets at the retiring shyness of the fair Greek, we tender our best thanks to the Cossack gentleman with long lance for keeping himself in the background. Truly his race is no favourite of ours, neither in appearance nor in manners. Who has not heard of the Cossack? Who has not read of the harassing style of his military attacks—

ever hanging on the rear of a discomfited enemy, murdering the wounded, and relentlessly picking off stragglers? Who has not been taught to regard this irregular cavalry as an integral and very important portion of the Russian army? Yet the Cossacks have not always owned allegiance to that mighty power. Originally they sprang from the greatest enemies of Russia, the Tartars, and subsequently they di good duty against Russia under the Poles. The Cossacks a only a small tribe, scarcely numbering 500,000 in all; neve theless, every adult male being a soldier, their military forc is great, an army of 100,000 at least being ever at the disposa of Russia. The origin of the Cossacks as a consolidated bod

MALAY, JAPANESE, CHINESE, PERSIANS, ARAB.

is modern. They appear to have arisen out of some Tartar tribes, who intermarried with native Russians, gipsies, and Kalmucs; and the name Cossack seems to be derived from the

LAPLANDER, TYROLESE, COSSACK, GREEK GIRL, HUNGARIAN, TURK.

Tartar word *Kasack*, or *Kasak*, meaning "light horseman." For a long time the race was known by the appellation Tsherkassi or Circassians, and even now their chief town is called Tsherkask. Nevertheless, they have little enough of Circassian beauty; their form and countenance, and general aspect, being far more indicative of the Mongol. This people was not known by the appellation Cossack until about the year 1516, when, for the first time, they made themselves rather conspicuous in Polish affairs. Their first alliance with

Russia was self-sought, and did not take place until the year 1654, at which time their effective military force consisted of about 40,000 men. From this period they remained faithful to Russia until 1708, when, under their hetman, or leader, Bulavine, they went over in a body to the Swedish monarch, Charles XII. This independence of character was necessarily prejudicial to Russia. The existence of a powerful armed body, owning no immediate allegiance to the Muscovite rule, was discovered to be so fatal to the interests of the latter, as to necessitate the disorganisation of the Cossacks as a military body. Accordingly this was effected by Peter the Great, who, however, shortly remodelled them on a new basis. Not pleased with the consequences of this new measure, the Cossacks threw up their semi-allegiance to the Czar, and committed themselves to the protection of the Khan of Crimea Tartars. Difficult to please, the Cossacks soon became disgusted with their new masters, and sued pardon of Russia—a pardon which was granted them by the Empress Anne. Ever since the latter event, the Cossacks have remained faithful to Russia, with which empire they are now so incorporated by social and religious ties, that they may be considered Russians in all respects.

A far better specimen of humanity is the Cossack's pictorial neighbour, the Tyrolese, one of a small but noble-minded race. The Tyrol, as it is now called, forms part of the ancient Rhætia, and is not quite double the size of Yorkshire. It is a very mountainous country—considerably more mountainous than Switzerland, although its mountains are not generally so high. At least three-fourths of Switzerland is sufficiently level to admit of plough cultivation, but scarcely one-tenth of the Tyrol is similarly situated, every portion of the little territory being a succession of mountain peaks, except a few narrow belts scarcely half a mile wide, on the average, which form the river banks. Unlike the Swiss, who are staunch republicans, the Tyrolese entertain a fervent love of imperial rule. They became incorporated with the Austrian empire during the twelfth century, and ever since that period have been sincerely attached to the Hapsburg dynasty. In 1805, Tyrol was ceded to Bavaria—an arrangement which so little pleased the mountaineers, that four years later, on the breaking out of war with France, the inhabitants rose at the instigation of Andreas Hofer, the Tell of the Tyrol, as he is sometimes called. Hofer's fate is too well known. Fruitless though this insurrection was, in its immediate consequences, politicians were taught that nothing but Austrian rule would ever satisfy the Tyrolese; accordingly, on the final adjustment of territory, in the year 1814, Tyrol was restored to the House of Hapsburg.

The little fellow standing on the extreme left of our woodcut, is a Laplander, whose stunted form, the effect of cold, has been faithfully represented by the artist. The denizen of an inhospitable climate, and far removed from the noisy turmoil of European politics, the Laplander engrosses but small attention. All that we can find time to say of him is, that although a denizen of Europe, he is not a Caucasian. The generality of naturalists consider him of the Mongolian stock.

XAVIER DE MAISTRE.

One January evening, 1794, in a pretty apartment of the Rue de Pô, at Turin, there met a party of eight young gentlemen to smoke, and drink, and talk as pleasantly as might be. They were soldiers. Some of them, though still young, had seen much service, and could discourse on marches and countermarches, and all the manœuvres of war, as well as the best. But something very different from martial glory brought them together that night; they had come to hear and to criticise a new composition by a young aspirant for fame—no other than the now justly-celebrated Xavier de Maistre.

Personally, Xavier de Maistre was unknown to most of them. They had heard of him as a young soldier of promising ability, fond of adventure, and bent on improvement; they had heard that he had made a balloon ascent, and with a provincial Mongolfier had taken a journey into the air. Recently he had made another journey, not so startling, nor so perilous, but one which promised to make him far better known than the first, namely, "A Journey Round my Room." He had written a book—this was the title—and by request the manuscript was to be read that night. Already the critics felt prepossessed in his favour. He was the brother of Joseph de Maistre, senator of Savoy, whose "Eloge de Victor Amedée" had gained him great popularity.

The Count d'Ailly, a brave but impetuous man, had been selected reader; and having chatted for some time on indifferent topics, he received the paper, unrolled it, glanced down the page with the eye of a connoisseur, and began.

Everybody knows the plan and subject of "A Journey Round my Room," that small *chef-d'œuvre* which has found no rival for sixty years. It is a series of impressions and philosophical reflections upon the body and the mind, the *self* and the *other self*, the soul and the beast. It was written during captivity, when the author's only companions were a valet and a dog. What bright touches of humour there are scattered throughout the work; how carefully he tells us that his room is in the forty-fifth degree of latitude; how he abjures those people who are so much masters of their movements and ideas as to say, "To-day I will make three visits, write four letters, and finish the work I have begun;" with what quaintness he depicts every part of his little domicile, the dog, and the valet Joannetti; how his reflections seem to leap up unbidden at the commonest incident—and how deep, and truthful, and clear they are; and how, all through, his double nature seems to haunt him—his body, the *beast*, of the "earth, earthy"—his soul wandering at will whithersoever it listeth, from the lowest pit of hell to the furthest fixed star beyond the milky way, to the confines of the universe, to the gates of chaos!

When the Count d'Ailly had achieved his task, and finished the reading of the manuscript, he was pleased to declare the author a man of talent, a man of first-rate order, and one who was destined for immortality.

Everybody praised the book except a young hussar, who had listened attentively all the time, but expressed no opinion on its merit. From words of civil praise, the company became enthusiastic in their admiration of the young *litterateur*; and, excited by the punch of which he had been drinking pretty freely, and the applause which his reading had obtained, the count began to draw a critical comparison between the compositions of the two brothers—a comparison which in no degree tended to the credit of the elder.

"Messieurs," said he, "it is clear enough to us all that the 'Eloge de Victor Amedée' is nothing more than a wild rhapsody when compared with this 'Journey Round my Room.' One abounds in words, gracefully piled, I grant you, but still little more than phrases; here you have thoughts, great thoughts, powerful thoughts—here the foliage is never cultivated at the expense of the fruit."

"Pardon me, sir," said the young hussar, "if I venture to differ; it seems to me that you overrate the ability of the writer. Xavier may have talent, but Joseph has something far beyond talent; he possesses genius of no common order."

The company became interested in the discussion; opposition adds to the entertainment of a critical disquisition. A combat of wit is far more agreeable than perfect unanimity.

"Sir," said the count, curling his long moustache on his finger, "you are greatly mistaken. I can detect a splendour in this rising orb which shall banish the pale light shed by the genius of the other."

The young hussar changed colour.

"The pen of Xavier," he remarked, "may amuse an idle hour, but that of Joseph is ever employed in imperishable

work. Posterity will crown him with favour when the 'Journey Round my Room' is entirely forgotten."

With this he began to recite some of the most eloquent passages from the "Eloge de Victor Amedée," with a power and beauty not easily described.

"You are remarkably critical, sir," said the count, ironically—the count was evidently piqued; opposition made him obstinate—"doubtless Joseph Xavier would be greatly obliged to you for your good opinion; no doubt he would fully concur in the sentiments which you have expressed; no doubt he is already—"

"What?" cried the young man, advancing three paces, and with a flush on his hitherto pale cheeks, that made them red as crimson.

"Peace! peace!" said the others, "the count meant nothing."

"I demand," cried the young man, "that he state distinctly what he did mean."

"As you will, as you will," returned the count; "I meant to say, and say it now distinctly, that Joseph's proud heart will be filled with envy at his brother's success?"

"It's false!" cried the other, "it's a base calumny!"

"Your words are violent, sir," said the count, and he laid his hand on his sword-hilt; "doubtless a gentleman so ready with warlike words will be as ready to support them in the warlike way."

"I understand you, count," returned the young hussar, "and am ready to support everything I utter. Joseph has too noble a heart to grudge at a brother's fame, if that brother even deserves it; and he that says otherwise lies!"

"Bravely spoken," said the count, as he rapped the lid of his comfit box; "now to business. Your name?"

"*Xavier de Maistre!*"

The count drew back in mute astonishment—the rest were filled with admiration.

"You see," said the count, "that the duel is now impossible—unnecessary—must not be—the matter is cleared up."

"Not so," returned the young man, "I cannot understand why a brother may not defend a brother's reputation as well as any one less tenderly connected."

"Of course," said the count, "the word calumny, the imputation on my character, is withdrawn, and we have but to pledge each other in a bumper, and be firm friends for ever."

"Stop, sir count, stop—I will never withdraw the word, unless you first withdraw that which called forth that word."

"Impossible!"

"Then the duel must proceed. I am not ashamed to assert my brother's honour, and I am not afraid to defend it with my blood!"

So they agreed that the duel should take place upon the following morning. Xavier went home, and wrote a loving letter to his brother, telling him the whole circumstance of the case, the provocation he had received, the quarrel that had ensued, and the duel which was to decide it at dawn next day.

He sent along with the letter his manuscript, begging his brother to read it and then commit it to the flames. As for himself, he expected to be slain—victory he did not look for; but how could he fall more nobly, so he wrote, than in defence of a man whom all France revered, and who was endeared to him by the still more loving ties of brotherhood? At early dawn he received a note from the count; it was couched in the following terms:—

"Monsieur,—You have prudent friends. The governor of Turin has had me arrested, and I am to be carried beyond the frontiers of Savoy. You must feel that this circumstance must not in honour be allowed to interfere with our meeting. I shall be ready, sir, to attend you at Cambray."

"Cambray," repeated the young man, mechanically—"and why not? should not a man go forty leagues, if necessary, to defend a brother's honour?"

He attached a postscript to his letter, saying that it was not at Turin, but at Cambray, that he should meet his antagonist, and then, having despatched the letter and manuscript, prepared to set out for the rendezvous.

But he was arrested—arrested in the full meaning of the term—disarmed in the name of the governor, and lodged as a prisoner in a chamber of the citadel.

Not many days after, Joseph de Maistre arrived at Cambray. There he learnt that no duel had occurred, that the count was boasting of the pusillanimity of the younger brother, and stil condemning the envy of the elder. Surprised and somewhat alarmed, Joseph wrote immediately to Turin, and—duels are contagious—professed his willingness to fight on Xavier's behalf. As for the book, that was already, not in the flames, but in the printer's hands—and when the news came that Xavier was in prison, Joseph hastened to him without a moment's delay.

Early one morning the garrison of the citadel were surprised by the sudden arrival of the senator of Savoy. The old walls echoed to the clatter of his horses, and half-a-dozen men were ready enough to answer all the questions the senator could ask. But they had no good news to tell. Xavier had escaped. Under cover of night he had stolen out of the citadel; they had sought for him in vain, and it appeared—they could not say for certain—but it seemed that he had taken the road to Cambray.

Allons! Joseph was on the road again. Never it seemed had horses travelled so fast before: away like the wind, over broad open country parts, down pleasant lanes, through village streets, over rustic bridges—fields and houses, towns and villages, left one after the other far behind—forward to Cambray.

At the hotel Joseph alighted. The servants were ready to render him assistance. What would monsieur please to take? Had monsieur heard the news, there was to be a duel? The Count d'Ailly and a young officer were about to fight. What was the young officer like? He was about monsieur's height, but younger, much younger; he was not unlike monsieur. The armourer had provided monsieur with a sword; he had none with him when he came. They would doubtless soon return—the wood was not far distant—a bed had been made ready for the wounded man. But there was a letter for monsieur and a book. A letter—so Joseph found—from the printer of his brother's book, and the book no other than "A Journey Round my Room."

So with this book held fast to his bosom, as if it were a precious relic, or some rare and valuable gem, the brother sought his brother. Several people accompanied him, and at length they came upon the very spot chosen for the encounter. The duel had not begun. And to make, as they say, a long story short, the duel never did begin. The matter was cleared up. The count saw well enough that he had misjudged both brothers, and the affair ended as such affairs have often ended before—in a breakfast.

As to the work, Joseph pronounced it a *chef-d'œuvre*—he declared his brother to be the Sterne of France—and said so many other things about the good qualities of the book and the talent and genius of Xavier, that the count confessed he had been greatly mistaken in one thing, namely the envy of the elder brother, but that he had been right all along about the merit of the book; had he not said it from the first?—had he not predicted the fame of the author?—and did it not seem something like fame, when in so short a space of time as had intervened since the night of the quarrel, the book had been printed, and ten thousand copies sold?

* * * * *

Tony Johannot, with inimitable skill, has depicted a scene from this "Journey Round my Room." It is that portion in which Joannetti contemplates the picture, and propounds that query touching the peculiarity of its expression:—

"'Here, Joannetti,' said I, 'hang up this portrait.'

"He had assisted me to clean it, and yet had no more idea of all that produced the chapter on the portrait than of what goes on in the moon. He had of his own accord handed me the damp sponge, and by that apparently trifling action had sent my soul flying over a hundred millions of leagues in one

second of time. Instead of replacing the picture, he retained it to wipe it in his turn. A certain inquiring look which overspread his features, and indicated that some difficulty—a doubt he wished to have resolved—occupied his mind, attracted my attention.

"'Come,' said I, 'what fault have you to find with the portrait?'

"'None at all, sir. But yet—'

"He placed the picture against one of the shelves of my escritoire, then retiring a few paces, he replied,

"'Would you have the kindness, sir, to explain to me why this portrait always looks straight at me, whatever part of the room I move to? In the morning when I make the bed the face is turned towards me, and if I go to the window, it keeps looking at me all the way."

"'In fact, Joannetti,' said I, 'if the room were full of people, this fair lady would look every way and at every one at the same time?'

"'Oh, yes, sir.'

"'She would smile upon all who came and went, as well as upon me.'

"Joannetti made no answer. I stretched myself in my easy chair, and letting my head fall on my breast, I resigned myself to very serious meditations. What a light breaks in on me! Poor lover! whilst you, far removed from your mistress, are a prey to vain regrets, your place with her, it may be, is already filled up; whilst your eyes are fixed upon her portrait, and you fondly imagine that you alone (at least in the picture) monopolise her glances, the perfidious image, faithless as the original, gazes on all who approach, and smiles on every one.

"Joannetti still remained in the same attitude, waiting the explanation he had requested. I raised my head from the folds of my travelling-dress, into which I had sunk it to meditate more at my ease whilst resigning myself to the sad reflections I had been making—'Do you not perceive, Joannetti,' said I, after a moment's silence, and turning my chair towards him—'do you not perceive that a picture, being a plane surface, the rays of light passing off from every point of that surface . . . ?'

"Joannetti, at this explanation, opened his eyes so wide that the whole pupil became visible; he half opened his mouth also;—these two actions indicate in the human face, according to the celebrated Le Brun, the highest degree of astonishment. Without a doubt it was my beast that had entered upon such a dissertation, for my soul knew well enough that Joannetti knew nothing of plane surfaces, and still less of rays of light; the monstrous dilation of his eyelids recalled me to myself. I suffered my head to sink down again within the collar of my travelling-dress, and there so ensconced myself that scarcely any part of it was left visible."

SCENE FROM THE "VOYAGE AUTOUR DE MA CHAMBRE."—FROM A DESIGN BY TONY JOHANNOT.

PALM TREES AND THEIR PRODUCTS.

THE DOOM PALM of Upper Egypt, an engraving of which is appended below, instead of shooting up in one stem like other palms, divides like a fork again and again, giving rise to the appearance which botanists term *dichotomous—i. e.*, the stem continually divides in a binary sense.

THE DOOM PALM OF UPPER EGYPT.

Having indicated, in a preceding article on "Palms and their Products," the general characteristics and the botany of this tribe, and briefly directed attention to the extraordinary number and variety of the products which they yield, we now purpose continuing our notice of these "princes of the tropical forest," as they have been justly called, by just sketching an outline—our space does not admit of more—of the chemical principles involved in the application of palm-oil to the purposes of the candle and soap manufacture. Well now as to soap—we fancy some reader exclaims—there may be something to say; but in respect to candles—with regard to which there surely cannot be anything new to be said—why waste our time by discussing so simple a topic? Candles—we still fancy the impatient reader to exclaim—what can be more simple, more self-evident, than the processes for manu-

facturing candles, which everybody knows are either dips or moulds?—the former being made by dipping a wick of cotton or other similar material into melted tallow, fat, spermaceti, or something of a similar kind; and moulds, by the more refined plan of casting the tallow, wax, and so forth, into metallic shapes. Impatient reader, if your knowledge of the candle-making art in its present development goes no further than this, you have yet something to learn, and may ponder over that which we shall now proceed to write with some advantage. Some twenty years ago, or at most thirty, the process of candle-making was that described above: that is to say, the manufacturer having first selected the material out of which the candle was destined to be made, enveloped a string of cotton or a length of rush with the material, and the process was complete. As regards form or structure, candles might be divided into dips and moulds; as regards composition, they might be divided into tallow, wax, and spermaceti. The ingenuity of man at that time could go no further; and if, by some dispensation of Providence, tallow, wax, and spermaceti had been annihilated, why the , as a matter of course, people must have done without candles. It so happened, however, that in the year 1811, or thereabout, a French philosopher, M. Chevreul, began to devote himself to the study of fatty or oily bodies. He continued these studies almost exclusively for more than twenty years, and ultimately he arrived at certain discoveries which altogether changed the aspect of the soap and candle manufacture. We will not at once state what these discoveries of M. Chevreul were, or what he did; we will pursue the other course of leading the reader to form some conclusions of his own from an observation of certain appearances.

To begin, then; it is not impossible that the reader may have observed, when looking at a flask or bottle full of olive oil, on a cold day, that the oil had then separated into two portions; one very much like spermaceti in appearance, the other thin and liquid. Now, had it been so desired, this solid portion might have been collected, separated from the liquid portion, and the spermaceti-like body, no matter what it is called, might, if it were found to be sufficiently hard, be made into candles. Had the inquirer proceeded in this manner he would have discovered that the spermaceti-looking substance did not possess sufficient hardness to form candles; but that its melting point was so low as to be incompatible with the conditions necessary to the existence of a candle.

However, although disappointed in this one instance, as to the practical result, a thinking mind would have arrived at a very important deduction, and a very pertinent question would have been raised—*i. e.*, whether oily bodies were really as simple as they appeared? Whether certain oils and fats, although soft and unctuous to the touch, might not, in reality, be made up of hard fats and thin oils; and, whether, in certain cases, the two might not be separable from each other? This notion, once begotten, many phenomena would tend to strengthen it: for example:—the beautiful substance spermaceti is obtained, as everybody knows, out of the head of the spermaceti whale; so, in like manner, is the bland liquid, sperm oil, the material so admirable as a lamp oil; but whilst the spermaceti whale is alive, these two bodies, namely, spermaceti and sperm oil, remain combined together just in the same manner as the solid and the liquid portions of olive oil. Many other examples exist, but we need not enumerate them; suffice it to say, that the genius of M. Chevreul, starting from these facts as a basis, turned them to some account. He made the important discovery, that all fixed oils—that is to say, all those oils which leave a permanent greasy mark on paper—are made up of several fatty bodies combined together; that some of these fatty bodies are thick, others thin; and, finally, that by certain chemical processes they admitted of mutual separation. This was a great step, but it was not the only step made by M. Chevreul. He next proved each of these separate fatty matters, of which any given oil or fat was made up, to be still further separable into two other parts: these might be a thick and a thin part, or two thin parts; the former class preponderating. This was the grand discovery. It follows, then, that by carrying out the discoveries of M. Chevreul, we might manufacture good hard candles out of olive oil. We have already seen that the thick part of this oil, which spontaneously separates during cold weather, is not, in its natural state, thick enough for candle-making purposes; but the amount of thinness which still lingers in it is not inherent—the thinness depends on the combination of a thin body with it; and this thin body being separated by chemical means, we, in the end, arrive, by the aid of chemistry, to a result—hard, pure, white, semi-crystalline, and very combustible, fitted in every respect for the purposes of the candle manufacture. We have cited what could be done with olive oil as an example only. As matters go, this material is too valuable for that application, and other kinds of oil and fat are too common and cheap.

It is time, now, to explain the chemical principles involved in the discoveries of M. Chevreul, and in what manner these principles are applied to the manufacture of candles from oily matters of naturally thin consistency. We shall impart to the reader a first notion of these principles by directing his attention to a collateral fact. We will assume everybody to be conversant with tartaric acid, the substance which constitutes the acid powder entering into an extemporaneous soda-water mixture. Let it be assumed, then, that a quantity of this tartaric acid is thrown into water, is dissolved by the water: the problem is to get it out. Various means are known of accomplishing this. That which will suit our case best consists in the addition of lime, which, if added in due proportion, combines with the whole of the tartaric acid and forms the tartrate of lime, which admits of separation from the liquid by subjecting the solution to proper treatment, which it is unnecessary, in this place, to describe. Suppose, however, the tartrate of lime obtained, and that the further problem is given of getting the tartaric acid from the lime—how can this result be effected? Simply, thus:—Oil of vitriol being added, in due proportion, it combines with lime and sets tartaric acid free.

Now the discovery of M. Chevreul, as regards oils and fats, was this:—he proved that the bodies in question, in the first place, were mixtures of many oils or fats; and, in the second place, he demonstrated that each of these consisted of an acid united with a base, just as tartrate of lime is the result of an acid combining with a base; the acid in the latter case being the tartaric, and the base lime. Now, the oily base is a limpid, thin, not very combustible, liquid, termed glycerine; and the oily acids are some of them thick and others thin, but all eminently combustible. These oily acids differ somewhat in their chemical constitution; but we shall be sufficiently near the truth if we consider all the hard ones as margaric or stearic acid, and all the soft ones as oleic acid. Such are the chemical principles involved; now for the application of these principles. Suppose the fatty body operated upon to be lard; everybody knows that this fatty material is much too soft to yield candles at once. But, applying our chemistry, let us now suppose that a portion of lard is melted with lime—what then should take place? Why, clearly, if what we have already said be true, the lime should combine with such fatty acids as the lard may contain (there happen to be two principal ones, margaric and oleic acid), and should set free the liquid base, glycerine. Well, this would advance the operation one step; a portion of the soft matter of the lard would have been got rid of. If now, proceeding with the application of chemical principles, we add oil of vitriol to the oleate and stearate of lime, it is evident that sulphate of lime (plaster of Paris) would result, and the two fatty acids would be set free. Now, one of these, oleic acid, as we have already announced, is a thin acid; we don't want *it* for candle-making, though it is well adapted for the manufacture of soap: we only want for our present purposes the thick or margaric acid. How, then, are we to separate the two? Nothing can be more simple: the mixture having been packed into linen bags, and exposed to pressure at a certain temperature, all the thin acid leaks away, and all the thick acid remains. The latter may be at once applied to the manufacture of candles. Such is a general

outline of one of the processes (for there is a second) by which those beautiful candles, termed composite, are now made. By conducting each step of the process with extreme care, it is possible to produce an article superior to the manufacture from either wax or spermaceti; however, in England prejudice runs strong in favour of the two latter; hence, the manufacturers of composite candles do not find it profitable to produce the most perfect candle which this manufacture is able to yield.

Thus we are no longer restricted to the employment of any one kind of fat, in the manufacture of candles. If we have a hard fat to deal with, why then so much less oleic acid, or liquid portion, has to be removed. If we have a naturally soft fat to deal with, why then the quantity of oleic acid removed is greater. What is done with the oleic acid? the reader will ask. Is it thrown away? Certainly not; it makes admirable soap, and for this purpose it is used, in England *now*, as well as elsewhere. Until the removal of an excise duty on soap, however, the valuable material could not be used for this purpose; but being shipped away to Germany, was there put into requisition by the soap-manufacturer: at present the necessity for this disposal of oleic acid no longer exists.

When first introduced, stearine candles gave the manufacturer great trouble, their material having a considerable tendency to crystallise. The presence in them of a minute amount of arsenic prevents such crystallisation; and, accordingly, this poisonous substance was added until popular feeling pronounced against its use. At present, the crystallising tendency is obviated by simply pouring the stearic acid into the moulds at a certain temperature. No doubt arsenic is an objectionable substance to be employed in this manner; but, nevertheless, the danger of using it was greatly exaggerated. A certain scientific lady arrived at a remarkable conclusion on the subject, which we may as well cite for the purpose of demonstrating the fallacy of a very pretty speculation. "I do not think," said this lady—"I do not think that the arsenical candles evolve any noxious amount of the mineral until they have burnt down rather low; but *then*," continued she, "the odour is very oppressive, because all the arsenic, by virtue of its great weight, sinks to the lower end of the candle in the process of casting." "Madam," interposed a gentleman well conversant with the candle-manufactory, who heard this explanation, "*but candles are cast upside down; therefore the arsenic, according to your view, should be in their tops!*"

One word more about the candle manufacture, and it is this:—although the process we have described for separating stearic from oleic acid is the general one followed, there is another exclusively employed at Messrs. Price's candle-factory. To describe this process now would be far too long an affair; we may perhaps do so on another occasion. *En passant*, however, we may remark, that although the steps of the process are different, the general results are the same.

Some very important social and political considerations arise from a study of the discovery of M. Chevreul. Vegetable oils seem destined in future to supersede tallow as furnishing the raw material for the soap and candle manufacture. Now palm trees are the greatest sources of vegetable oil, and the quantity which may be obtained from these denizens of the vegetable world is in a manner without limit. Africa is the region of these palm trees;—the western coast—slave-trading region of Africa. It follows, then, that as our palm oil trade increases, and native labour becomes valuable; so in that proportion will the slave trade diminish. It follows, moreover, that we cannot be, as we have been, mainly dependent on the supply of animal fat from foreign countries—chiefly Russia. Thus has science been true to her genius; the discoveries of a French philosopher in relation to fats, independently of adding to our comforts and luxuries, are increasing our national independence, developing our commercial resources, breaking down a foul traffic, and ameliorating the social and political relations of the whole world.

AN ELECTRIC TELEGRAPH ROUND THE WORLD.

The project of establishing a telegraphic communication all round the globe, is one upon which public attention on both sides of the Atlantic is fixed with growing interest. The remarkable progress of the present age, which has been brought about by the harmonious combination of science, industry, and capital, leaves little room for doubt as to the ultimate accomplishment of the project. It is only a question of time. Sooner or later, we may rest assured, the world will be girt round with an electric wire, by means of which all the principal cities and courts, as well as all the chief seats of commerce and homes of science, will be indissolubly united. The success of existing submarine telegraphs has convinced many that one may be laid down across the Atlantic, connecting Halifax in America with the most westerly promontory of Ireland.

But such an undertaking might meet with accidents which would do it great damage. For the line would be exposed to exactly the same mishaps as befel the wire running from Dover to Calais; and if it were broken in one or two places between the two coasts, what power or skill could join it again without bringing the whole to land? This is the real danger which appears to threaten the existence of a submarine telegraph round the world.

Another circumstance also requires to be taken into account in connexion with this subject. A wire laid down across the Atlantic could only serve for the conveyance of communications to and from two points at a distance of 3,000 miles apart. At no intermediate point could messages be received or despatched. Along the whole line no accessory advantages could be reaped. It would be like an extra line of railway from London to Edinburgh without any intermediate station.

There is, however, a course round the globe by which both the danger of interruption from one cause or another, and the useless expense attendant upon a submarine telegraph across the Atlantic, might be avoided. The government or people of the United States will soon extend the main line of their telegraph, *viâ* California, to Oregon. On the other hand, the telegraphic lines of Europe stretch towards the East nearly as far as the Uralian mountains. The necessity of a speedy communication with her Asiatic provinces will soon induce Russia to extend the line of telegraph in this direction. The whole of the territory between this point and California is in possession of Great Britain, Russia, and the United States. Why, then, should not a combination be entered into for the establishment of a line across Behring's Straits? Behring's Straits are reckoned to be not more than thirty or forty English miles in breadth, with two or three islands between, which might serve as intermediate stations, and would leave no greater width of water than that between Dover and Calais. The Russian government might easily keep up a watch upon the part of the line in its dominions; and the governments of Great Britain and the United States might do the same in their respective territories. Hence this route would always be free from such dangers as would constantly threaten a line connecting Halifax with the Irish coast.

Thus, a telegraph between San Francisco and St. Petersburgh would be a main line of communication round the world; for the extension of it from St. Petersburgh to London would be an easy matter, and it would, in time, extend its branches over the south of Europe and Asia. With the spread of civilisation one of these branches might at last reach even the inhospitable shores of China. Another route is proposed from Labrador or Davis' Straits to Iceland, thence to Greenland, and thence to the north of Scotland. This, though requiring a greater length of submarine wire, has the advantage of not rendering the concurrence of Russia necessary, and, therefore, not being liable to be interrupted by war. One or the other certainly seems practicable, and if established, a great system of international intercourse, carried on with the rapidity of thought itself, might ultimately pervade the whole earth, banishing discord, and bringing about that happy millennium of peace and prosperity for which humanity is ever sighing.

CASTLE FOLLIT.

CATALONIA is the most eastern province of the Spanish peninsula, divided from France by the Pyrenees. It has the title of a principality, and its chief wealth is derived from its manufactures and maritime trade. Castle Follit, a gloomy city of this district, distant about eighteen miles south-east of Campredon, acquired a fatal notoriety in 1822. In the war between the Carlists and the Constitutionalists—a war which desolated all Spain, and made the history of that period red with blood—the inhabitants of Castle Follit followed the example of the insurgents at Sen d'Urgel and Balaquer, and joined the Don Carlos party. Towards the end of the month of October following, the famous constitutional leader, Mina, became master of the city, and terrible was the vengeance which he inflicted. Town and castle were burnt to the ground. Mina himself, in the account which he has given of the event in the published bulletin, says: "The city is now nothing more than a desert. Houses and fortifications, all, have disappeared: it now speaks to other cities of the tragical end which is sure to follow so foolish an enterprise as that of lending the ear to the perfidious suggestions of those who would appeal to arms in support of the enemies of the public good. On one of the most conspicuous parts of the ruin is traced this inscription: 'HERE STOOD CASTLE FOLLIT; CITIES, LEARN BY THIS EXAMPLE THAT THERE IS NO FAVOUR FOR THE ENEMIES OF THE COUNTRY.'"

The ruins of the city are seen on an abrupt elevation,

THE ROCKS OF CASTLE FOLLIT.—FROM A DRAWING BY P. BLANCHARD.

which, to all appearance, is totally inaccessible, and is supported by basaltic columns resembling, in a very great degree, those of the grand cavern at Staffa. The whole of the surrounding country is volcanic, and geologists consider it to be the principle locality of these volcanic phenomena which have contributed to the formation of the chain of the Pyrenees.

Much controversy has taken place as to the origin of the words "Castle Follit." The general opinion appears to be that its name is derived from *Castellum Fultum*, fortified castle.

JOHN KEPLER.

John Kepler, the celebrated astronomer, whose labours heralded and partly contributed to the discoveries of our immortal Newton, was born at Weil, in the duchy of Wirtemberg, on the 27th of December, 1571. His father, Henry Kepler, was an officer in the pay of the Duke of Wirtemberg, and distinguished himself in the war in Flanders; his mother's maiden name was Catherine Guldenmann. Having imprudently become security for a person, who absconded, the warrior was compelled to part with all he had in order to discharge the obligations under which he had placed himself, and was fain to content himself with the humble position of a tavern-keeper at Elmendingen. This reverse rendered it necessary to remove young Kepler from school, and employ him at home. Such, however, was the extraordinary precocity of the youth, that when eleven years old he was admitted to the convent-school of Maulbronn, and educated there at the expense of the Duke of Wirtemberg. Here he pursued his studies with untiring assiduity, in spite of constitutional weakness and domestic troubles, and at the age of twenty took his master's degree, ranking second at the examination. Shortly afterwards, he was appointed astronomical lecturer at Grätz, in Styria, not so much in accordance with any wish of his own—for he had not yet, he tells us, devoted any great attention to the study of astronomy—as out of deference to the authoritative dictates of his tutors.

Theology had occupied most of his thoughts from the time of taking his degree, and some of his compositions on that science attracted a good deal of attention. Now, however, he began to study astronomy with even greater interest and more decided success. The prevalent notions on astronomy were far from satisfying his penetrating mind. With a view to their correction, he published his "Mysterium Cosmographicum," in 1596, which was his first work, and formed a worthy prelude to those which followed. In this he put forth a number of very ingenious conjectures with reference to the number, distances, and periods of the planetary orbs. Like our own great Adams at Cambridge—though not under the guidance of equally scientific principles—he presumed upon the existence of planets not yet known, and declared that the only reason why they had not been discovered, was the imperfection of the optical instruments employed in making observations. The boldness of his creative genius, as displayed in this work, struck Tycho Brahe with astonishment, and led him to invite Kepler to visit him—an invitation, however, which the latter did not then think proper to accept, because he was aware the illustrious mathematician held a doctrine directly opposed to his own.

About this time Kepler married a lady of noble family, Barbara Muller von Muhleckh, who was now a widow for the second time, though only twenty-four years of age. The union was a source of difficulty and embarrassment, which, with the religious dissensions in Styria, led to his removal to Hungary. Here, during an interval of three years, he published several minor works, including a treatise on the magnet. Tycho Brahe, who still watched his progress with deep interest, once more endeavoured to attract him near him. This eminent philosopher had been forced to leave Uranienbourg for the asylum which Rodolph the Second, Emperor of Bohemia, offered him in Bohemia, and promised to procure Kepler the post of mathematician to the court, if he would come and reside there. Kepler, having learnt that Tycho Brahe was making astronomical observations of great value at Benach, went to visit him in the year 1600, and was most kindly received; but a serious indisposition, which lasted seven or eight months, prevented him from entering upon the duties of his office, as imperial mathematician, till the following year. The object of his appointment was, that he might assist Tycho Brahe in the formation of new astronomical

PORTRAIT OF JOHN KEPLER.

tables, to be called the Rudolphine Tables, after the emperor, who promised to bear all the expense, and liberally reward him. Circumstances, however, prevented the fulfilment of this promise. Kepler's salary was not regularly paid, and besides this, the employment was not exactly to his taste. He was involved in pecuniary difficulties, and even driven to eke out a subsistence by casting people's nativities. His impetuous disposition brought him into frequent collision with Tycho Brahe, his great benefactor. He sighed for his liberty. "Rodolph II.," said he to his friend, "is more of an astrologer than an astronomer. To satisfy him, I am obliged to waste my time in making almanacks for him." This was the way in which he spoke of the calendar which he assisted Tycho Brahe in preparing, and which had the misfortune to be burnt by the nobles of Styria, in 1621, because Kepler had given precedence in it to the nobles of Austria. The prefaces to several works which he issued at this period bear evidence of the pecuniary embarrassment which he experienced. Besides having to contend with the irregularity of payment to which we have already alluded, he had a numerous family to support, and, on the death of Tycho Brahe, undertook the charge of his also. In his perplexity, he applied to the landgrave of Hesse, who kindly rendered him valuable pecuniary and other assistance. In a preface addressed to the emperor, in 1618, he acknowledges the receipt of 4,000 pieces of silver; and it is impossible to read his remarks without a painful impression.

Kepler's great work on "The Motion of Mars," which forms a sort of stepping-stone from Copernicus to Newton, was published in the year 1609. After confuting the prevalent notions upon gravity, he distinctly asserts that the attraction of the moon operates upon the earth, and amid a multitude of errors throws out here and there other happy guesses at truth. The three great principles which Kepler is immortalised for having discovered, and which are well known under the name of "Kepler's Laws," are, that the planets move in elliptical orbits, that they describe equal areas in equal times, and that the squares of their periodic times are proportional to their mean distances from the sun. He did not succeed in establishing the last till twelve years after the other two, and then more by lucky conjecture than sound philosophical deduction. The labour he underwent before he could arrive at the first was immense. Starting with the assumption that the planetary orbits were of an oval form, he was disappointed to find that his calculations failed to demonstrate it. "All my theory, therefore," cried he, "has vanished into smoke." He began his work again; the arithmetical operations in which he engaged filled more than twenty-six pages; he failed every time he renewed the attempt. His vexation at this disappointment nearly drove him mad. No less than sixty-nine times did he renew his efforts; but the seventieth time he obtained the desired result. His joy was now unbounded. He surrounded figures of ellipses with symbolical designs. Ordinary language was insufficient to express all he felt; his enthusiasm could only find full scope in mystical symbols. Another discovery of Kepler's was the proper method according to which the glasses of a telescope should be combined and arranged; but he made no practical application of his theory. To enumerate all his published works would exceed our limits and only weary the reader. It is sufficient to say they were very numerous, some voluminous, and all remarkable. Kepler was the precursor, and in some degree the father, of the seventeenth century—that age which was rendered illustrious by the names of Newton, Descartes, Pascal, and others, who brought about a great reformation in science and general knowledge.

Sir Henry Wotton, the English ambassador, made an attempt, in 1620, to persuade Kepler to visit England, and held out a prospect of relief from the pecuniary embarrassment in which he was then involved; but he could not succeed. After appealing for assistance to various governments, Kepler at length completed the Rudolphine Tables in 1627. He was on the point of publishing a translation of a work of Plutarch, when he was compelled to go to Ratisbon for the arrears of his salary. The fatigue of travelling, together with the annoyance he felt, brought on a fever, of which he died on November 5th, 1630, at the age of fifty-nine. He was buried in the churchyard of St. Peter's at Ratisbon.* A brief inscription, which does not now exist, was placed upon his tombstone; and in 1808 a monument was erected to his memory under the auspices of the prince primate, Charles Theodore of Halberg. It is a temple situated in the Botanical Garden, not many yards from the spot where his remains lie. His bust in marble occupies the middle of the building, and stands on a pedestal, the bas-reliefs of which represent the genius of Kepler drawing aside the veil which conceals Urania. The goddess holds a telescope in one hand, and in the other a roll, on which the eclipse of Mars is delineated.

PEERS AND M.P.'S;
OR,
LORDS AND COMMONS.

PARLIAMENTARY FORMS.

LEGISLATION usually commences in the shape of a bill. To the first reading of a bill generally little opposition is made. The member who introduces it makes a long speech in its favour, and little discussion takes place. The real fight is when it is read a second time. There are many ways of throwing out a bill without the discourtesy of a positive rejection. The first of these means consists in giving a preference to "other orders;" the second is "moving the previous question." Another is moving "that the second reading take place this day six months." If the bill get over the second reading, it then goes into committee, when objectionable clauses are struck out and fresh ones added, till the original proposer of the bill can hardly recognise his offspring. The bill is then read a third time, and afterwards sent up to the Lords. Possibly the Lords object to some parts of it; a conference with the Commons is then desired, which accordingly takes place, the deputation of the Commons standing with uncovered heads, while the Lords, with hats on, retain their seats. The matter being amicably arranged, and a disagreeable collision avoided, the bill is passed through the Lords, where it usually creates a far more orderly and less passionate debate than it has done in the Commons. It then receives the royal assent, and becomes law—a fact announced by the words "Je le veux," if the Queen acts in person; or by the phrase, "La Reigne le voet," if, as most frequently happens, the royal assent be given by commission. The private bills, which take no small portion of the time of the house, are expensive luxuries. On an average, few cost less than £500 or £600, and frequently the clever parliamentary agents, to whom they are intrusted, manage to run up the expenses to as many thousands. Occasionally a bill is introduced in the form of a motion, at other times as a resolution, but generally the bill is the favourite form. Any bill which the Lords can originate may be introduced and laid on the table by any individual peer, without the previous permission of the house; but in the Commons, no bill can be brought in unless a motion for leave be previously agreed to. Mr. Dod tells us, during the progress of a bill the house *may* divide on the following questions:—1. Leave to bring it in. 2. When brought in, whether it shall be then read a first time, and if not, when? 3. On the first reading. 4. On the second reading. 5. That it be committed. 6. On the question that the Speaker do leave the chair, for the house to resolve itself into such committee. 7. That the report of the committee be received. 8. That the bill be recommitted. 9. That it be engrossed. 10. That it be read a third time. 11. That it do pass. 12. The title of the bill. These are quite exclusive of any divisions concerning the particular days to be appointed for proceeding with any stage of the measure, or of any proceedings in committee, or any amendments, or any clauses added to or expunged from

* For engravings and an account of St. Peter's cathedral, see pp. 275-7.

the measure in or out of the committee. Such being the case, no one can wonder that a bill is pretty often cut off in its career. The wonder is that any survive so trying a process. In committee the Speaker leaves the chair, and his place is taken by a member elected by the house for this purpose; but he does not sit in the Speaker's chair, but at the table, the seat of the Clerk of the House. For committees of supply, and ways and means, and bills introduced by ministers, there is a chairman, who receives a salary.

A member who wishes to resign, solicits of the crown the stewardship of her Majesty's Chiltern Hundreds, the stewardship of the Manor of Poynings, of East Hendred or Northstead, or the Escheatorship of Munster—sinecures which he holds till some other member accepts a similar appointment. As no office, having emolument attached, can be conferred by the crown on a member of the House of Commons without his thereby vacating his seat, and as it is only by obtaining office that a member can rid himself of the duties which any body of constituents may impose, even without his consent, the acceptance of the Chiltern Hundreds merely means that a member has resigned his seat.

The orders of the house, besides those to which we have referred, call for no special remark, with one exception, and that is, with reference to amendments. This one seems very much misunderstood. At public meetings, people are always getting into confusion when amendments are put. We may as well, then, briefly state what the practice of the House of Commons is. When, says Mr. Dod, an amendment has been moved, it is usual to take the vote simply for the amendment, and then for the original motion. But in parliament the practice is, that the chairman or speaker should read to the house the original motion, next that he should read the amendment, and then say, "the motion which I am about to put is, that the words proposed to be left out in the amendment stand part of the question." Should the noes prevail, the amendment then becomes a substantive motion, upon which other amendments may be moved and considered in like manner as the first. Thus a number of successive amendments to the original motion may be disposed of, though no amendment can be moved upon an amendment, but all the amendments, as well as the motion itself, may be negatived. Any member is at liberty to interrupt another by rising to order—viz, calling attention to the fact that a breach of order was then being committed. When two or more members rise at once to address the House of Commons, the Speaker or chairman determines who shall have precedence. It is out of order to mention in debate any member by name, or to speak in direct terms of any proceedings of the other house, unless they have been formally made known by message, or recorded in the notices, with an order of the other house. Formerly, independent members had two days in the week for their motions, and government the rest. Last session they suffered a great hardship in this respect, Tuesday only being allowed them; but, as a compensation, the forms of the house allow members to bring forward a question on the motion that the Speaker do leave the chair, or that the house at its rising do adjourn till a certain day. This is often done, and leads to an animated debate. Members wear their hats, except when they rise to speak; and during the short interval between the strangers being turned out of the galleries previously to a division, and the division itself, they have the inestimable privilege of being allowed to speak, at the same time retaining their hats and their seats. Occasionally it is difficult to keep order, but this is rarely the case. When a man worth hearing gets up, he is listened to; and if a man be dull, and prosy, and roundabout, it is no great wonder that the house is inattentive, or that it gets very thin, especially if the time be anywhere between seven and nine or ten—that time sacred to dinner, a meal senators require as much, if not more than other men.

In concluding this section, we will give a little gossip we have collected from various sources. In the case of disorder the Speaker sometimes threatens to name names. "And what will be the consequence?" asked that squinting democrat, Jack Wilkes. "The Lord in heaven only knows!" was the somewhat profane reply. Chairmen and Speakers have at times availed themselves of the power they possessed for party purposes. Clarendon confesses that as chairman of the committee on the bill for turning the bishops out of the Lords, he managed so to muddle matters and confuse the house, that eventually the measure fell to the ground. That haughty Speaker, Sir Edward Seymour, was a sad sinner in this respect. Burnet tell us, when a question was to be put, before the court party were prepared to carry or reject it, as the case might be, he would purposely blunder and put the question wrong, till the court party had mustered in sufficient strength to attain their object. Even the tellers on a division have also played strange tricks. On one occasion, one of the tellers, says Burnet, was in a fit of the vapours, and a very fat lord coming up, his brother teller counted him as two. The absent-minded teller took no notice of the blunder, and thus the bill passed by a majority of one! We don't hear of such tricks now-a-days.

PARLIAMENTARY MORALS AND MANNERS.

We now come to lighter work; for our view of parliamentary morals and manners will be of a somewhat superficial kind. From any more serious inquiry we, in common with the reader, instinctively shrink.

The house at present consists of 654 members, being 467 for England, 53 for Scotland, 29 for Wales, and 105 for Ireland. Arranged according as they represent counties and divisions of counties, or boroughs, they stand thus:—

ENGLAND AND WALES.

159	members for counties or divisions of counties
337	members for boroughs
Total 496	members for England and Wales.

SCOTLAND.

30	members for counties or divisions of counties
23	members for boroughs
Total 53	members for Scotland.

IRELAND.

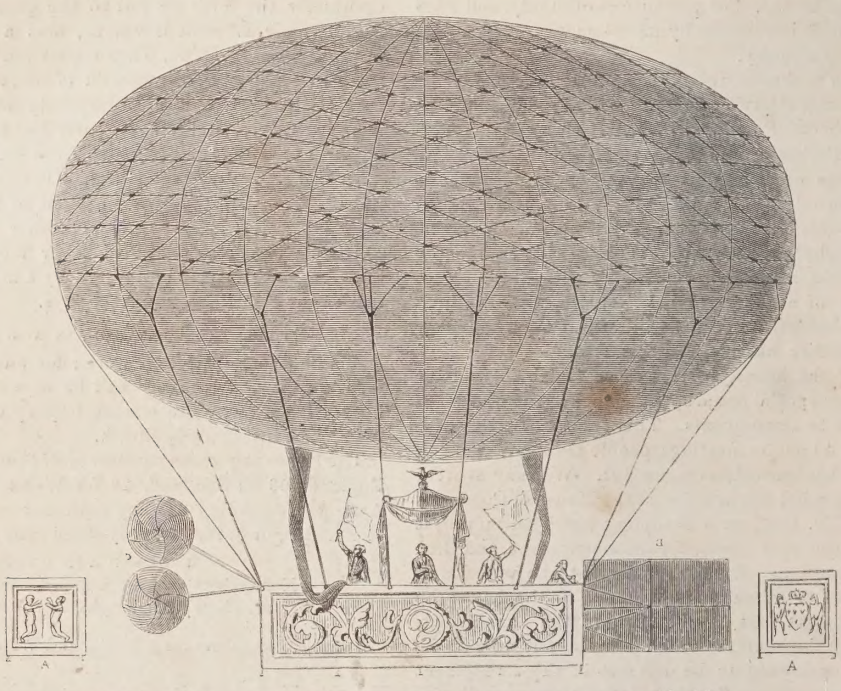
64	members for counties or divisions of counties
41	members for boroughs
Total 105	members for Ireland.

Sudbury and St. Albans have each been disfranchised, and thus the house has lost four members. It was long before the number was definitely settled. Two hundred citizens and seventy-four knights sat in one of Edward the First's parliaments. Under the Plantagenets the house consisted of three hundred members. In the time of Henry VII. the Principality was allowed to return twelve members. From that date to the accession of Charles I. the house had received an addition, by writs from the crown, of fifty-seven members. As calls upon the purse became more frequent, the number of representatives increased. When Coke presided as Speaker, they were four hundred and ninety-three. The Long Parliament consisted of five hundred and six. The convention which placed William of Orange on the throne consisted of but one hundred and sixty.

To get members to attend seems always to have been a matter of some difficulty. Mary and Elizabeth fined the absentees, and the result was, that under James the attendance became so great that fresh seats were required for their use. In 1640 it was declared to be a constant rule, "that Mr. Speaker is not to go to his chair till there be at least forty in the house." All writers speak of the readiness of M.P.'s to evade their duties. Prynne complained of them in his day as wasting their time "in taverns, play-houses, dining-houses, cock-pits, tennis-courts, bowling-alleys," &c. Writing a century later, Horace Walpole says, "The seventh was appointed for the naturalisation bill, but the house adjourned to attend at Drury-lane." A century later, this very last session, the house was counted out on the night of the day when a review had been held at Chobham. Occasionally members are brought together by a call of the house, but that is a step seldom taken.

BALLOONS AND BALLOONING.

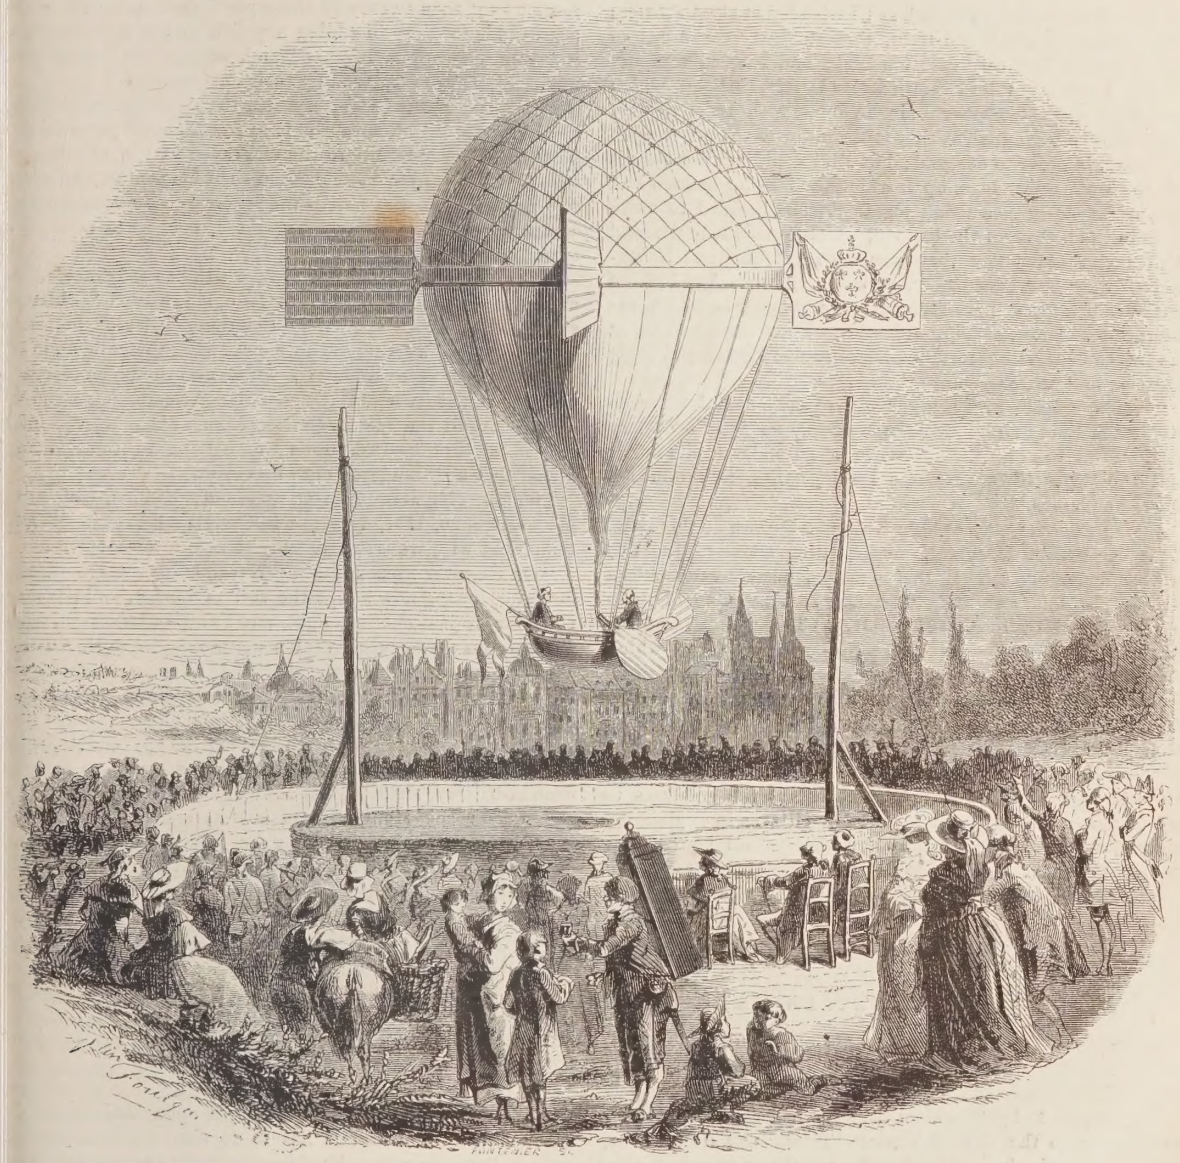
THE letters which Etienne Mongolfier received from his brothers, stating their views and giving him their encouragement, found him depressed, fatigued, harassed in every way, tormented at once by his rivals and his admirers. His wife vainly supplicated



ASCENT OF A BALLOON FROM THE PARK OF ST. CLOUD, JULY 15, 1784.

THE ABOVE BALLOON AT A GREATER ELEVATION.

him patiently to endure his celebrity. He desired and asked only one thing, which was to return to his native place, the scene of his cherished dreams, to hear once more the whispers of its poplars and the rippling of its waters; to resume those walks with his brother Joseph, in which their feet only traversed a narrow space, while their thoughts surveyed the world. But as commissioners had been appointed by the Academy to inspect his experiments and to confirm his discovery, honour did not permit him to withdraw; and his balloon having been shattered in its last ascent from Annonay, it was found necessary to construct another; but whilst the



ASCENT OF A BALLOON FROM DIJON, APRIL 25, 1784.*

workshops were freely opened, and assistance and help of every kind offered, to those who strove to excel the two brothers in the aerial route which they alone had disclosed, Etienne could only look for co-operation and support among his private friends. A rich manufacturer of painted paper, in the Faubourg St. Antoine, the excellent M. Reveillon, threw open his vast warehouses to his dear friend Mongolfier, offered him his services, and, with unparalleled generosity, abandoned his beautiful gardens to the curiosity of the crowd, who broke down the railings and scaled the walls, in order to behold the wonderful machine.

The struggle which the inventor had to sustain against those who strove to outdo him, and to turn his glory to their profit, was truly melancholy. It required all the devotion of his friends, Reveillon, Argant, the Marquis d'Arlandes, and others; it required his personal activity, his extraordinary intellect, and the composure which he owed to an unchangeable gentleness of disposition, to prevent the priority which belonged to him from being snatched away. M. Charles and the Messrs. Robert could only repeat his experiments; they succeeded, however, in gaining the favour of powerful protectors, and, strange to say, the Duc de Chartres entrusted to them the management of the experiment, represented in the first of the annexed engravings (p. 316.)†

* This balloon, which went off at five o'clock in the evening, reached Magni-lez-Auxone at twenty-five minutes past six, having traversed a space of about two miles and a half through the atmosphere. Abbé Berteau and M. Morvaux went up in it.

† This ascent took place under the superintendence of Messrs. Robert, two brothers, who went up in the balloon with M. Colin. A A, the two ends of the gallery, representing Castor and Pollux and the arms of France; B, the Rudder; C, Oars or Wings.

Couplets full of acrimony, and cutting caricatures, accompanied the prince in his ascent; most of these were without foundation, for they accused the duke of cowardice, when, on the contrary, he had shown presence of mind in giving vent to the gas, and in splitting the balloon, which threatened to burst. In an unpublished letter from Beaumarchais, who was an eye-witness, to Etienne Mongolfier, who was then on his return home, we find the following account of this disastrous journey:—

"*Paris*, 18 *July*, 1784.

"You have doubtless heard what has taken place at St. Cloud. Marquis le Duc de Chartres, the two Roberts, and their brother-in-law, ascended, as Charles did at the Tuileries; but, fearing to touch the trees, they suddenly threw out so much ballast that they rose too high, and entered a cloud, which, I know not how, caused the interior balloon, which was filled with atmospheric air, to burst with an explosion. They then endeavoured, as they still continued to rise, to open the valve, in order to descend; but they could neither open it nor the lower appendage, upon which the interior balloon had collapsed. After consulting together, they decided to make holes in the bottom of the balloon, which caused it to descend with such rapidity that they incurred great danger. Nevertheless, they descended safely, no one being hurt. The balloon was mended for a more fortunate experiment, in which the interior bladder was dispensed with. Four days before, at the Luxembourg, the poor Abbé Miolan narrowly escaped being a martyr to your religion.

"Adieu, monsieur; I beg you to give some consideration to the best manner of directing the balloon; for it is necessary for it, as well as everything else, to be guided, and the father of the child at least owes it a leading-string to conduct it where he pleases, &c."

Among the numerous ascents which took place at this time, those of Guyton Morvaux alone, putting those of the two brother inventors out of the question, were made with a serious purpose, and arrived at any result. One of these is represented by our artist (p. 317). The members of the Academy of Dijon sought for a means of guidance which they never found; but the ascents of Guyton, and the exact accounts which he gave of them, tended somewhat to advance the art of aerostation. The following letter from Etienne Mongolfier bears testimony to this fact:—

"Sir,—I have read with the greatest pleasure the particulars of your experiments, which you have had the goodness to send me, and I have joined your fellow-citizens in applauding the zeal and intelligence which have directed all your operations. You have indeed felt all the possible advantages and all the actual inconveniences of the machine of which you have made use. I cannot but admire your ulterior views, and exhort you to establish their solidity, in the eyes of the incredulous, by the continuation of your experiments.

"The unforeseen danger which prevented you from realising your project of travelling from place to place, should not discourage you from trying again. Above all, I admire the candour with which you state the obstacles that thwarted your experiments, and the means by which you contrived to surmount them. Thus it is, that one should always write upon scientific subjects, sacrificing one's self-love to their advancement, and giving an account even of one's failures, in order that others may avoid them. A memoir such as yours is more useful than twenty of those poetical descriptions, whose authors take a glory in adding a polish to the marvellous, as if nature were not sufficiently grand, without the foreign ornaments which are furnished by their imaginations."

It seems needless to add anything to this simple, noble letter of Etienne Mongolfier, which is so free from all personal prejudice. We way return to the biography of this philosopher whose soul was even more exalted than his genius, and whose temperate writings, as well as the letters of his contemporaries which were written in an exaggerated, egotistical style, give some insight into his character.

Our second engraving (p. 316), which has reference to the ascent of Messrs. Robert and M. Colin, is intended to illustrate some French verses written at the time, in which horsemen are represented as racing at full speed after the balloon, in the vain attempt to overtake it, while everybody on earth is amazed at the daring of the adventurous aeronauts; and the inhabitants of the moon—philosophers as well as the unin formed multitude—look upon the balloon as some strang planet that has wandered out of its orbit.

The following account of an ascent of a balloon, which took place June 26, 1794, is given in Carlyle's "French Revolution," and will, we are sure, be read with interest:—

"Or see, over Fleurus in the Netherlands, where General Jourdan, having now swept the soil of liberty, and advanced thus far, is just about to fight, and sweep or be swept, hang there not in the heaven's vault some prodigy, seen by Austrian eyes and spy-glasses: in the similitude of an enormous wind bag, with netting and enormous saucer depending from it? *Jove's* balance; *your* poor Austrian scale having kicked itself aloft, out of sight? By heaven, answer the spy-glasses, it is Mongolfier, a balloon, and they are making signals! Austrian cannon-battery barks at this Mongolfier; harmless as dog at the moon: the Mongolfier makes its signals, detects what Austrian ambuscade there may be, and descends at its ease. What will not these devils incarnate contrive?"

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER XVIII.

ANY months had passed since the day when the doge returned in triumph to the city of Venice. Time, as he always does, had wrought his changes in the affairs of the state as well as of individuals. The republic had lost one of her best men and bravest soldiers, Vittorio Pisani, who died a few days after the surrender of Chioggia. Carlo Zeno had taken his place, going out to Zara in the galley that brought to Venice the remains of his friend and companion in arms. The war with the Genoese still lingered on with various success; tempest and famine wrought their work in the fleet; the senate, as usual, visited the consequences of their own imprudence, as well as of the storms and starvation, upon their general; and Zeno was thwarted, reprimanded, and threatened with imprisonment; but as yet the popular voice was too loud in his favour to render it safe to carry the threat into execution, and his own manly remonstrances, for a while, over-awed his rulers. Time, too, as we said, wrought his changes upon individuals, and those with whom our tale has to do were not exempt. Ah! who is there on whom he does not leave the impress of his cold hand as he passes? The child, as he grows to boyhood puts away childish things and childish thoughts; the boy, as he attains to manhood, exchanges smiles for sorrows, and puts care upon him even as he puts on years; grief and infirmity come to age; and to all come trial and mutation, and at last the grave.

It was once again the spring, that season which everywhere is fraught with the charms of renascent nature, but which is nowhere more fresh and lovely than in Italy. It was spring, one of the bright, merry days in March, when the wind drives the light clouds athwart the sun, making their shadows flit across the sunlight of streets and squares, and upon the gleaming waters, and the glittering domes and spires of palaces and

churches. It might be about four in the afternoon, when our old acquaintance, the Count Polani, found himself just entering the Corso degli Orifici, at Venice. He paused a moment, as if in doubt whether he should proceed, and took counsel with his own thoughts.

"Diavolo!" said he musingly, "who could have foreseen that things would have turned out so unfortunately? Well, well, something must be done, and at once too; as well to-day as to-morrow, and better, for the time is drawing near. So, in the name of the Virgin, I will go to the old fellow even now; perchance I may move his soul by the prospect of greater gain in the end. Andiamo."

The count drew his black cloak more closely around him, and passing along the shady side of the street—a practice which in all ages gentlemen in monetary difficulties instinctively adopt—he proceeded at a pace so slow, that any one who marked his movements might readily conjecture he was bound upon no agreeable errand. Whether any eyes were upon him we shall not say; but certain it is, that after consuming twice the necessary time in the operation, he did at length arrive at a certain point of the street at which he came to a complete stand-still. The bottega, or booth, at which the count stopped, did not in appearance differ from those which ranged along the street. Beneath a projecting shed of timber that sloped down from the first story stood a table, covered with a carpet or thick woollen cloth, which reached in front down to the pavement. On the table were placed several leathern money-bags of different sizes, a small casket or chest for letters of exchange and bills on foreign goldsmiths, a pair of scales, an account-book, and an inkstand; behind was a bench, upon which sat an elderly man, wrapped up carefully in a fur-trimmed gown, and covered with a bonnet of black felt. He was diligently occupied in the examination of his account-book, in which he was making some entries, when the Count Polani addressed him.

"Buon giorno, good Messer Molo; thou art deep in thy studies, methinks. Thou hast pleasant memorials there of thy friends, doubtless, so that thou shalt not readily forget them. Is it not so?"

The old banker looked up from his book. As he recognised the speaker, his small gray eyes became for a moment fixed intently upon the face of the count, as if he would read his heart, and discover the cause of this unexpected visit; then he replied with his usual placid look:

"A servirla, signore. I rejoice to see your lordship, and in such a pleasant mood too. It is true indeed, as you say, I have abundant memorials of my good friends here," and he touched the book with his finger; "but I know not they are always so pleasant as I could wish. Just now it is somewhat the contrary; I was counting how much the friendship of a certain member of the Pregadi, who did me the honour to take my bills of exchange, shall cost me when I strike my balance. However, the unwonted honour of a visit from your excellency may help to cheer me."

The old man looked again with his sharp eye at the count.

"By my faith, I know not, Ser Molo, how that may be. I have come to talk with thee, however, touching matters that affect us both. Can I crave a moment with thee in some better privacy than the street of the Corso degli Orifici affords."

"Assuredly, signore," said the banker. "Will your excellency excuse me for a moment?" he continued, rising from the bench and passing through a small door behind him into the ground story of the building. He re-appeared speedily, followed by the youth whom the count met at his first interview with the banker, and then said—"Will your lordship have the goodness to pass round the table? we shall be private in the apartment within."

The count complied, and Molo led him into a chamber in the lower part of the same house, the upper story of which the count had visited from the water-side on the night that he bought the goldsmith. Molo pointed with formal respect his guest to a chair, and seated himself in one opposite. The two sat for a time in silence; there was evidently a trial of skill between them, each endeavouring to throw the opening of the conference upon the other. The cooler temperament and superior skill of the banker triumphed, and the count at last broke silence.

"Thou dost remember, doubtless, Ser Molo, a certain loan which I had of thee somewhat near a twelvemonth since?"

"Perfectly, sir count; your excellency gave me your bond for the repayment with interest, to which there was added a certain defeasance."

"Precisely."

"Is your lordship disposed to discharge the debt now? The time is not yet expired, nevertheless; should your lordship so wish——"

"Diavolo! did you ever know a man pay beforehand?" said the count, interrupting the goldsmith, somewhat testily.

"As you ask the question, signore, I can't say that in my experience I have ever met such a case."

"And thou never shalt, believe me. But didst thou ever know a debtor not prepared to meet his obligation when the day arrived?"

"Ah! frequently—that is quite in my experience."

"Well, then, worthy Messer Molo, I am come to increase your knowledge in that way. In a word—I have no money."

"Your lordship surprises me; men believe that the spoils of the Chioggia——"

"I care not what men believe or say on that head; but little of the treasure reached my hands, and that little——" and the count waved his hand impatiently.

"Oh! I understand," said the goldsmith; "but, surely, your good friend Ben Aaroni would gladly——"

"The devil take the Jewish dog: where he has once fastened his teeth he will never let go his hold till he takes away the flesh with him. Why, I had to pay him to the last florin, not many days since, to redeem my palazzo, and now I am without a coin in my pouch."

"Ah, that is very sad; but it is fortunate that your excellency can meet your engagement to me without money."

"Pooh! pooh! thou meanest that silly jest which passed between us touching my ward."

"And which," added the goldsmith, "was fairly writ out in the obligation and duly signed and sealed by your lordship. Should you wish to see it?"

"Not I, faith. Thou wouldst of course never think of losing thy money, even if I were to take thee at thy offer; but set thy mind at rest. I shall never hold thee to so foolish a bargain."

"In the first place, signore, the money is not mine but my nephew Girolamo's, as I advertised you on the occasion of lending it. In the next place, he is aware of the arrangement, and will, therefore, require at my hands either his gold or the young lady."

The count sprang from his chair in a fury—

"So help my God and all his saints, thy nephew shall as soon get my ward in marriage as he shall the Adriatic; when he is doge he may look for her, not till then."

"Though a citizen of Venice," replied Molo, cooly, "I know not that Girolamo has any desire for so high a station; but he has the rights of a citizen, and will of course know how to enforce them."

"Rights! what speak you of rights? Dost not know that mere citizens, such as thou and thine, are not permitted to aspire to the noble daughters of Saint Mark without the license of the state? Thou wilt but make thyself and thy nephew a jest in the mouth of every patrician."

"Not when I can produce such a document as this with the seal of the grand council attached to it." And the goldsmith drew forth from a drawer a folded parchment.

"These presents testify," he continued as he opened the document, "if your lordship will please to peruse them, that for divers services rendered to the republic of Venice by Pietro and Jacopo Molo, citizens, it hath seemed good to the grand council of the state, upon the prayer of the said Pietro and Jacopo, to grant unto Girolamo Molo, the son of the aforenamed Jacopo, license and authority to intermarry with any

lady of noble degree, notwithstanding any ordinance to the contrary."

The banker proffered the parchment to Polani, but the latter waved it away with his hand. Molo then quietly folded it up and replaced it in the drawer. The operation gave the count time to recover from his astonishment and to cool down in temper. When they were both seated again he resumed the conversation.

"My good friend Molo, this is folly or madness. An union so ill-assorted, and between persons who are unacquainted with each other, could never be happy. Should I force the lady Bianca to give her hand, I cannot compel her heart to go with it. Will thy nephew take a bride on such conditions?"

"If he refuse to do so, then shall the lady be released and your lordship acquitted of your obligation."

"Meantime, to avoid such an alternative, whereby he may lose both money and bride, I have a proposal to make."

"If it so please your lordship to state it, I shall attend."

"My palazzo is, as I told thee, redeemed from the Jew. I will now pledge it to thee for the repayment of thy loan at such reasonable time as thou shalt name, provided thou wilt deliver me up the bond."

"What interest do you propose to give, should I be minded to let the money stand out, signore? The laws of Florence and of Venice allow us to take as high as twenty-five per cent."

The count groaned.

"Well, I shall not chaffer with thee on that point, if thou wilt give me a year for repayment."

"Count Polani, we Molos have ever made it our rule to lend our moneys at reasonable interest; therefore we never take more than that which thou hast already stipulated to pay."

"Ah! thou art a just man," interrupted the count, brightening up hopefully.

"I do humbly affirm that I am a just man, sir count—one who ever performs his own obligations and expects others to do the same. I have made my contract with your lordship, and shall abide by it. Were you to offer me cent. per cent. at the end of another year, I would refuse it. We shall wait, my nephew and I, on you at the palazzo, according to the condition of the obligation. You will doubtless be then and there prepared to fulfil either alternative of the condition."

The count arose once more, but his face was now deadly pale, and his lip quivered with suppressed emotion. At length he spoke slowly and almost calmly:

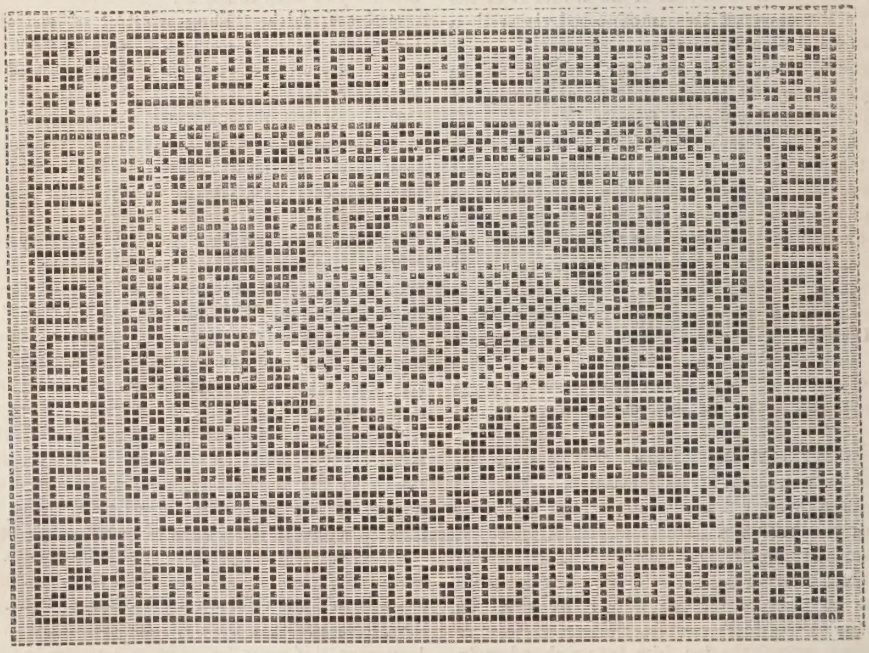
"Thy money thou shalt have upon that day, if by any human means I can procure it—if not, by the blessed Saint Theodore, I swear thy nephew shall not marry the maid without her free consent. Sooner would I see her a corpse at my feet. Now bide thy time, and do thy worst."

The count drew his cloak closely round his breast, and passed with a hurried step out of the room of the goldsmith.

"Ah, che sono collerichi questi nobili!" said old Molo when he found himself alone, "there is no getting them to listen to reason; as to expect them to talk rationally upon money matters, that's quite too much. Yet will I not, for all the threats of this proud noble, forego my cherished hopes for the aggrandisement of our house. Why should not the Moli climb as high as the Medici? If this count shall be able to repay the loan, well—if not, then I am justified in requiring him to fulfil his contract. My brother, Jacobo, is well pleased with the prospect of this alliance; and as to Girolamo, if he be not as blind as an owl at noon-day, and a fool into the bargain, he will account himself the luckiest youth in Italy; besides, he is too well-nurtured a lad to gainsay his father. I wish he were arrived, as the time is drawing nigh; by my advices he should be here before the week is out."

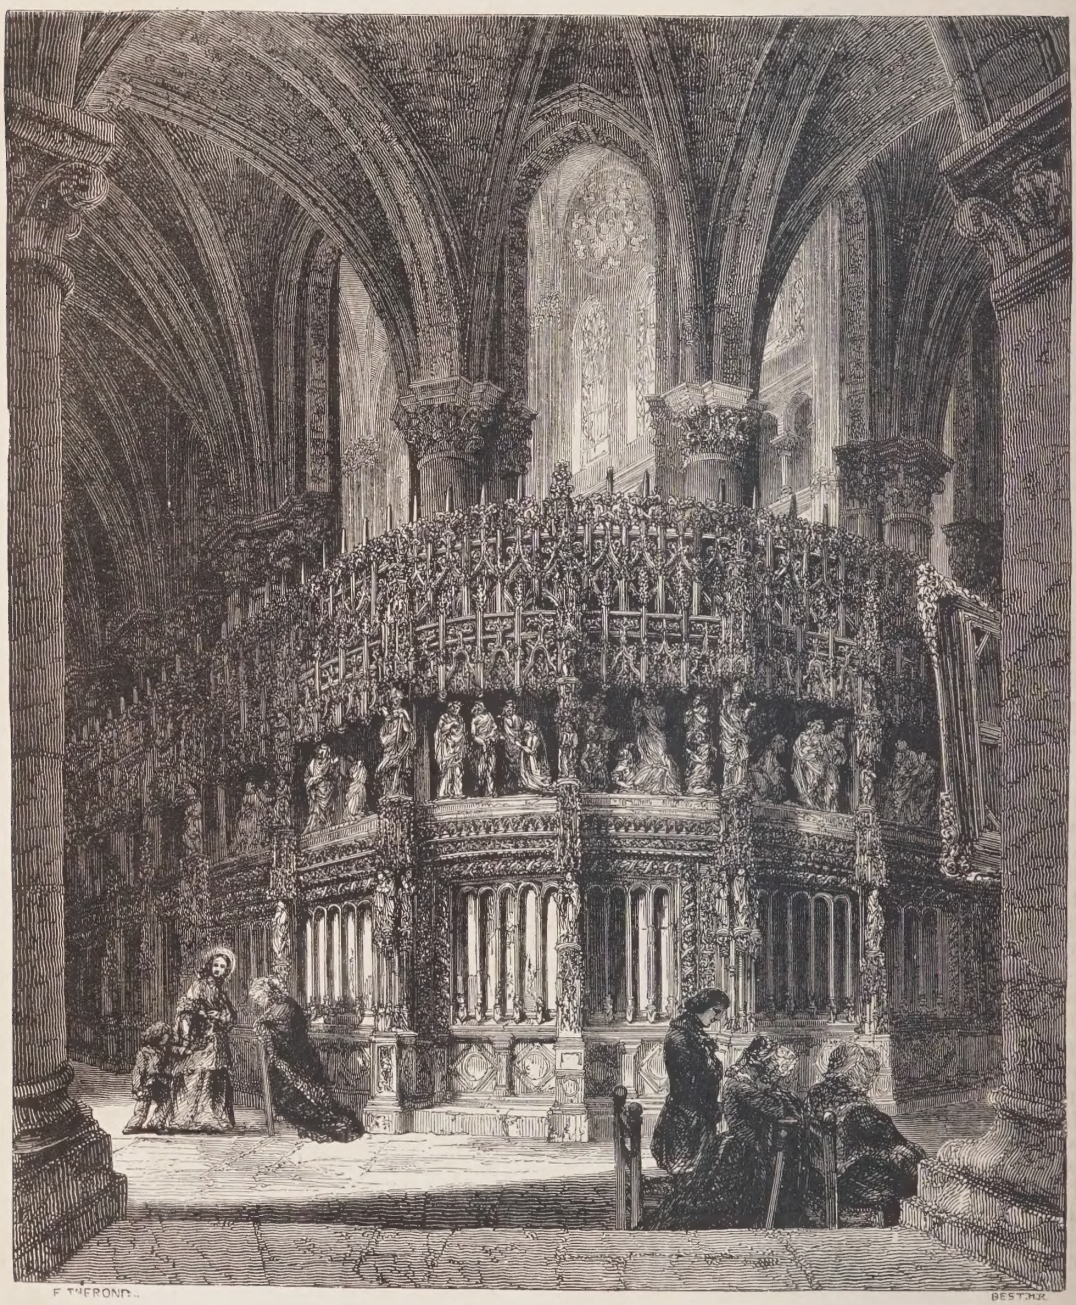
The pale face of his grandson at the door broke upon the old banker's meditations, and summoned him to attend to the duties of his calling outside. In another minute he was engrossed in the agreeable occupation of giving specie for a bill of one of his correspondents, a certain wealthy goldsmith of Madrid, and deducting a very satisfactory discount in the process of transmuting paper into gold.

TIDY IN SQUARE CROCHET.



MATERIALS.—Brooks' Exhibition Crochet Cotton, No. 14: Walker's Penelope Crochet-hook, No. 2½.

Make a chain of 289 stitches, which will form ninety-nine squares; with this cotton and hook it will measure twenty-five inches; the pattern must be worked from the engraving and may be increased in size by using a coarser cotton and thicker hook.



CLOISTER OF THE CHOIR OF THE CATHEDRAL OF CHARTRES.

THE CATHEDRAL OF CHARTRES, IN FRANCE.

The cathedral of Chartres is, as is well known, one of the most magnificent in all Europe, and is rendered conspicuous, both far and near, by its two spires, which, though unequal in height, tower in graceful symmetry high above the hill on which the city of Chartres is built.

There is a great deal of perplexity with respect to the date assigned to the construction of the various parts of this cathedral, for it is evident that it was not all built at the same epoch. The crypt, which runs beneath the entire length of the aisles of the choir, appears, however, to be the only remaining portion of the edifice which was built by Bishop Fulbert, in 1029. Owing to the great reputation this good man had acquired both in France and in the rest of Europe, he was enabled to carry out his design in a manner hitherto unknown in his country. Canute, King of England, and Richard, Duke of Normandy, were among the princes who assisted him with their contributions. It is, therefore, much to be regretted that we have but so small a part of the primitive building left; for, as Cassiodorus says, *mores fabricæ loquuntur*. Something more was added to it by Thierri or Theoderic; but the northern part was afterwards erected in 1060, at the expense of Jean Cormier, a native of Chartres, and physician to the king. The cathedral, as it exists at present, was not dedicated till 1260, and the greater part of it may safely be said to have been erected in the thirteenth century. The western front was, however, finished in 1145, with the exception of the elegant spire, erected in 1514, by Louis XII. and Jean Texier, an architect of the Beauce; this spire is 304 feet high, and the workmanship of the upper part of it is most beautifully light and most elegantly executed. In the western façade, which is very simple in its style, there is a triple portal of painted arches, the centre one of which is supported and flanked by statues of royal saints. These figures, which are attenuated and enveloped in formal drapery, are very characteristic of the Byzantine style of sculpture of the twelfth century. Over the door, is the image of Christ, surrounded by the symbols of the four Evangelists, as spoken of in the vision of Ezekiel. Below, are the fourteen prophets in a row, and in the arches above are seen the twenty-four Elders, playing on musical instruments belonging to the middle ages. The sculptures of the portal on the right relate to the life of the Virgin Mary, while those on the left portal represent Christ, surrounded by angels, with the signs of the zodiac, and the agricultural labours of the twelve months.

Handsome as these portals are, the two entrances on the northern and southern sides are much finer; they consist of triple projecting Gothic porticoes resting on piers, or bundles of pillars, with side openings between them. The majestic statues which fill the sides and vaults are executed in a superior style of art, and date from a more recent period than those of the western façade.

The interior of the cathedral is very vast, being 422 feet in length, while its height from the ground to the apex of the roof is 112 feet. The style of the whole of the nave and choir is that of vigorous and early Gothic. In the centre of the former, there is a sort of labyrinth of intricate circles marked out in coloured stone on the pavement; its various windings form a length of 1,320 feet, and it was probably used, at one time, for the performance of penitential exercises; those doing penance being compelled to follow its every turn, and to stop to pray at certain stations. The cathedral is very rich in painted glass, and contains more than 130 windows completely filled with it, while there are but very few which are quite destitute of this kind of ornament. Most of these windows date from the thirteenth century, and some of the glass is half an inch thick. The three rose windows at the end of the nave and transepts are noted for their size, being thirty or forty feet in diameter, while their complicated tracery is truly astonishing, though, perhaps, somewhat clumsily executed.

But it yet remains for us to speak of the most remarkable part of this splendid cathedral. We mean the screen of the choir, which forms one of the wonders of French art, and which was begun in 1514, after the designs of Jean Texier. The choir itself has a double aisle, and a semicircular end; in the inside there are eight marble bas-reliefs, representing scriptural subjects, of rather indifferent design and execution; while behind the altar is a large marble piece of sculpture, in the taste of Louis XIII., and which is not at all in keeping with the character of the edifice. The outside of the screen is one entire mass of magnificent sculptures. The groups of figures which form its principal feature were executed for the most part by Michel Boudin, a clever sculptor of Orleans, about the year 1611; they were added to, about 1681, by Dieu and Legros, a sculptor of Chartres; and were completed, from 1700 to 1706, by less celebrated artists.

In his "History of the August and Venerable Church of Chartres," the good and veracious Sablon speaks in the following terms of this *chef-d'œuvre* of architecture and of sculpture:—"The screen of the choir is made up of very white and highly polished sculptured stone, of the most exquisite workmanship and is enriched with images, hieroglyphics, and other rare devices. On this screen are well-executed sculptures, representing the different scenes in the life of our Lady, and the mysteries of our redemption. Around the choir, are twenty-three niches, filled with figures which are nearly as large as life, and which have been executed by the most clever sculptors of past times; but those executed by Boudin far surpass all the others.

"In 1681, Monsieur Dieu placed in one of the thirteen niches which were yet to be completed, four figures of his own execution, and which represented the woman taken in adultery, our Saviour and two Jews, one of whom is looking attentively at what our Saviour is writing, while the other is running away; these figures are very natural and expressive of the subjects they represent. On this day, Saturday, June 5th, which is the eve of Pentecost, 1633, Monsieur Legros, another famous sculptor, has placed in the next niche four fine figures representing the miracle worked by our Saviour on the person of the man who had been blind from his birth; these figures are admirably executed, for it appears as if you really saw done the action which is represented there; the blind man is in a most natural position, and the image of Jesus Christ is executed in a manner well suited to represent the action he is performing; the two other figures are attentively looking on, and their suspense is plainly apparent in their countenances. There are at present but eleven niches, with their ornaments, to finish, and fill with figures representing our most sacred mysteries. The members of the chapter are too zealous in the cause of God, and too desirous to embellish their church, to leave this part of it incomplete, which, when finished, will be a wonder of Christianity, and will instruct the ignorant as much as the most evangelical preachers can."

The wish of the old historian was satisfied. The screen has long been completed, and it has luckily suffered hardly any injuries either from time or man. On it, there are forty-one groups of figures.

The pilasters which separate these groups one from another, as well as the walls which serve as their base, and which form the screen, are ornamented with arabesques, niches, Gothic canopies, sculptured columns, statues, and medallions. The whole is surmounted by a trellis of open pyramids and tracery, of such exquisite and delicate workmanship that it has been compared to goldsmiths' filigree-work, or point-lace in stone. The rare beauty of this piece of art would alone suffice to give celebrity to a cathedral which is also famous for so many other *chefs-d'œuvre*.

It was in the choir of this cathedral that Henry IV., of England, was crowned in 1594, Rheims, where coronations generally took place, being then in possession of the Leaguers.

PEERS AND M.P.'S;

OR,

LORDS AND COMMONS.

PARLIAMENTARY FORMS.

The oldest parliaments were the shortest. Edward III. summoned three or four in a year. Under William and the first Georges, the houses generally met in October or November, and were prorogued in April. Important debates usually lasted from one or two in the afternoon to six or seven in the evening. The following summary, taken from Mr. Townsend, of what parliament has done in the making of laws, proves that it proceeded with more than geometrical progression. The parliament of King William passed 343 public, and 466 private acts; of Queen Anne, 338 public, and 605 private; of George I., 377 public, and 381 private; of George II., 1,447 public, and 1,244 private; of George III., 9,980 public, and 5,257 private. An appalling array of figures for the nerves of the stoutest sitter. Members' hard work commenced with the American war, and Gibbon gives a glimpse of the fatigue. "I am on the Grenvillian Committee of Downton. We always sit from ten till three, after which I went into the house that day and sat till three in the morning." A reckoning has been made of the work done by a late House of Commons. It appears that in one session the house sat 122 nights, between 2nd February and 17th August; and about 2,000 hours were devoted to public duty. With strict propriety of speech may this amount of labour be termed immense. General Gascoyne, one of the members for Liverpool, in proof of hard service, stated that he had carried two hundred bills connected with that town alone. Another writer remarks: "In the seven sessions between 1822 and 1828 inclusive, 2,100 acts of parliament received the royal assent. The king sends these measures into the world in bevies of eighty and even a hundred at a time. The number of public petitions printed has averaged 1,400 in the session. There are piles upon piles of reports." Early sittings were the fashion at one time. The Long Parliament resolved, "That whosoever shall not be here at prayers every morning at eight o'clock, shall pay one shilling to the poor." As twelve was the dinner-hour, business was soon concluded. Under the Restoration the hours gradually lengthened. In his usual lively manner, Steele complained of this:—"At present," he writes, "the courts of justice are scarce opened in Westminster Hall when William Rufus used to go to dinner in it. All business is driven forward. The landmarks of our fathers, if I may so call them, are removed and planted further up into the day; insomuch that I am afraid our clergy will be obliged, if they expect full congregations, not to look any more upon ten o'clock in the morning as a canonical hour. In my memory, the dinner has crept by degrees from twelve o'clock to three, and where it will fix nobody knows." The division on the address in 1783 did not take place till half-past seven, a.m. In the same year, the motion for the Speaker leaving the chair, on Fox's Indian Bill, was put to the vote at half-past four in the morning. During the Westminster scrutiny, the house sometimes sat till six. This bad custom received a check at the passing of the Reform Bill, but it is promising once more to resume its wonted power. This last session has been a great sinner in this respect. The adjournment of the house on Saturday dates from the time of Sir R. Walpole, who generally set apart that day to the sports of the field.

Sir R. H. Inglis calculated the speaking members at four hundred. This calculation is pretty correct. Of the Irish, we may estimate all as speakers. Yet Hamilton made but one speech; and Hare, who was to have surpassed Fox, never spoke at all. "Isaac Hawkins Browne," said Dr. Johnson, "one of the first wits of this country, got into parliament and never opened his mouth." In spite of a resolution to the contrary, the historian of the "Decline and Fall of the Roman Empire" did the same. Yet some dull dogs have the capacity of prosing for hours.

In past times, one of the greatest of these was a man of the name of Hartley. It is recorded of this worthy, that Mr. Jenkinson left the house as he rose to speak, rode to Wimbledon, dined, rode back, and found the unconscionable talker still prosing on to an "audience fit though few." The provision that members should be of age was much broken through at one time. The property qualification was passed in the reign of Queen Anne; yet from that qualification the sons of peers, members for the universities, and Scottish members, are exempted.

The dress and deportment of members have both gradually improved. Swords are laid aside, and there is no longer any danger, as in Sir Philip Warwick's time, of the house being the scene of murder. Boots, at one time considered not quite the thing, are, however, now admitted with impunity. The first Mr. Pitt was always in full dress. Modern etiquette is less strict and annoying. Still, however, on the first day of the session, the four members for the City of London take their seats on the treasury bench in all the gorgeousness of scarlet robes and chains; and the mover and seconder of the address are still bound to appear in court dress or in uniform. The house no longer hisses, and since the house resolved, in 1693, that no tobacco be taken by any member in the gallery, nor at the table sitting at committees, members may complain of dust, but not of the fumes of meerschaum or cigar. Outside the house, in the lobbies, or the smoking room, members may smoke as they please—and not unfrequently, especially late in the evening, they may be met redolent not merely with the scent of tobacco, but with the fumes of substances still more potent and popular.

The house has not always behaved well to literary M.P.'s. It treated poor Steele very badly: it would not allow him to be heard. "He thinks he can speak because he can write," murmured one country squire to another. "We'll teach him better than that." The house is not guilty of such Bœotian rudeness now. It treats men of literature with deserved respect.

The old formality of dress at times created no small amusement. Wraxall, in his memoirs, tells us, "never was a more total change of costume beheld than the House of Commons presented to the eye when that assembly met after the Easter recess." The treasury bench, as well as the places behind it, had been for so many years occupied by Lord North and his friends, that it became difficult to recognise them again, dispersed over the opposition in great coats, frocks, and boots. Mr. Ellis appeared, for the first time in his life, in an undress. The ministers who succeeded excited still more astonishment, having thrown off their blue and buff uniforms, now in full dress, with swords, lace, and hair powder. Even some degree of ridicule attached to this extraordinary and sudden metamorphosis. Just at this time it happened that Lord Nugent's house, in Great George-street, having been broken into, a variety of articles was stolen; amongst others a pair of laced ruffles. He caused full particulars of the effects stolen to be advertised in some of the daily papers. Coming down to the House of Commons immediately after the recess, a gentleman, who sat next his lordship, accidentally asked him if he had made any discovery of the articles recently lost. "I can't say that I have," replied his lordship, "but I shrewdly suspect that I have seen some of my laced ruffles on the hands of the gentlemen who now occupy the treasury bench." This reply, the effect of which was infinitely increased by the presence of Fox and Burke in their court dresses, obtained general circulation and created no little laughter. If manners make the man, dress has something to do with his opinions. In our own time Young England and white waistcoats were synonymous. At one time, to be an M.P. was the sure sign of being the owner of a shocking bad hat. The working men in the house are generally plainly dressed, with the exception of Disraeli, who loves to shine in dress as well as in debate. Some gentlemen are said to attend the house in morning costume and then hastening to a dinner party or a soirée, dress in a cab as they go along. It is said, that on one occasion, a cab containing an M.P. thus engaged was upset before the metamorphosis was completely effected, and the

result was a distressing display, more easily imagined than described.

PARLIAMENTARY SCENES—THE LORDS.

Associations good and bad—tragic or the reverse—of shame or glory—cluster round the senate of our land. For instance, you enter the House of Lords. Everywhere around you are historic names. The only modern thing is yourself and the chamber in which you sit. The men who came over with William—who dictated Magna Charta to the pusillanimous and craven-hearted John—who fought with the Black Prince at Cressy, or with Henry at Agincourt—who shared with the English Bluebeard in the spoils of the Romish Church—are here in the persons of their sons. Others also are here, whose history has less in it of honour, and more of shame. You hear names that take you back to that dark period in our history when Charles II. wielded the English sceptre—when vice was no barrier to the palace—when England's princes stooped to pocket the pay of France, and when England was a scorn and a byword amongst the nations of the earth. The bastards of such kings—these are brought back to your memories as you see their coroneted children taking their place in an assembly that should be an assembly of what is greatest and best in our midst. But the shame has been done, and a race born in dishonour has a career of honour open to it as well as others. Yet the Upper House offers but few incentives to such a course. The business of the nation is done elsewhere. The responsible minister, from the time of Sir Robert Walpole, has sat in another house. With the exception of Shaftesbury, and St. John, and Chatham, no memories of power, and genius, and patriotism speak to us from these walls. Many an illustrious career has been buried in a peerage. Thus was it with Pulteney, with Walpole in the past; and thus is it with Brougham at the present time. Great orators come to the Upper House when their work has been done. They go there for repose, not for action. In the Lords, the barometer points to calm, not storm.

On going back to the infancy of parliament, we find much that seems to us incongruous and out of place now. Under the date of 1377, for instance, we read in the "Parliamentary History" as follows:—"Now that Edward III. being too old and infirm to meet his parliament, a commission was granted to Richard, Prince of Wales, to hold it in his stead. At the day of their meeting in the painted chamber, the young prince, then about ten years of age, sitting in the king's own seat, Dr. Houghton, Lord Chancellor and Bishop of St. David's, made a speech in the nature of a sermon, from the text, 'Ye suffer fools gladly, seeing that you yourselves are wise.' The reverend divine argued that God loved the king and the kingdom: the king, because *quos diligit castigat*, and because the Psalmist said, *Uxor tua sicut vitis abundans in lateribus;* thence he showed no Christian prince could be so happy. That God loved the realm, he proved from the recovery of so renowned a prince; the said recovery happening in the fifteenth year of his reign, the year of jubilee, the year of joy for his said recovery. Then arguing that, though the head be sound, if some particular member be diseased, the benefit that otherwise would result could not possibly accrue; so he inferred that the king being now the sound head, and willing to show grace and favour to his subjects, they ought to qualify themselves aright by approving their loyalty sound and uncorrupted. Having thus enforced the duty of freely giving, and quoting St. Paul for that purpose, the courtly divine addressed himself more particularly to the Lords. They, he was sure, should rest happy in the belief that the good king loved them dearly, since he had, upon their request, advanced the Lord Richard, there present, to be Prince of Wales. Then he proceeded to show what cause they had to cherish the said prince, by offering unto him, as the wise men did to Christ, all honour, by presenting him gold in token of riches and renown, and myrrh in token of his honourable sceptre, since even the pagans were used to strew abroad money at the approach of their princes. He insisted that 'the said prince should, without all rancour, be embraced with their hands and hearts, even as Simeon had embraced Christ, because their eyes had now seen that which their hearts had much longed for; that they ought to obey him as the vicar and legate of God, that they might see the true peace of Israel.'" Of course, the end of all this was a subsidy. Modern readers, however, will think it a roundabout way of getting one.

In the Lords' journals, under the date of June 4, 1610, we have an account of the singular creation of Henry, Prince of Wales, by his father, James I. We read:—"This day the chamber, commonly called Whitehall, or the Court of Request, was very richly hung from the upper end more than half down towards the lower end, where there was set up a strong bar of timber thwart the room. In the highest part of the room was placed for his Majesty a sumptuous cloth of estate, and of either side scaffolds for ambassadors of foreign countries. On each side against the walls were erected seats, one above another, for strangers and noble personages, with the Lord Mayor and his brethren in the midst. Upon forms and woolsacks did sit all the lords of the parliament, and the judges in their robes, and likewise the officers and attendants, as in the days of the sitting of parliament. Below the bar was placed the Speaker's chair, forms on the ground, and seats on each side one above another, fit and convenient to receive the whole House of Commons. His Majesty being come, the Prince, his highness, honourably attended by divers noblemen, the Knights of the Bath, Officers-at-arms, and his own servants, entered in at the nether end of the house, and was with great state and solemnity brought up to the foot-path before the king, where kneeling at the first, and then standing, his highness was with all reverence created Prince of Wales and Earl of Chester, and a patent thereof first read by the Lord Treasurer, principal secretary of his Majesty, and afterwards delivered to him; which done, and all ceremonies finished which thereunto appertain, the prince, his highness, in great state and magnificence, some little time after the king's majesty, departed the court at Whitehall." Alas for human pomp and prince! A few years, and that prince himself departed to another and more solemn court summoned by a terrible and irresistible power.

THE WARRIOR'S FAREWELL.

The incident depicted in the subjoined engraving is one of the most affecting that occur in life: Hence it is not surprising that Homer has availed himself of it. Every reader of his immortal Iliad, which tells "the wondrous tale of Troy divine"—whether in the original Greek or in the English version of Chapman, Pope, or Cowper—must have been struck with the singular beauty of that episode in the sixth book, which describes the parting of Hector from his wife Andromache and his little boy Astyanax, just before his fatal encounter with Achilles. He meets with them at the Scæan gate, and a most touching interview takes place; from Pope's version of which we are tempted to quote a few lines:—

"Silent the warrior smil'd, and pleas'd resign'd
To tender passions all his mighty mind:
His beauteous princess cast a mournful look,
Hung on his hand, and then dejected spoke:
Her bosom labour'd with a boding sigh,
And the big tear stood trembling in her eye.
'Too daring prince! Ah, whither dost thou run?
Ah, too forgetful of thy wife and son!
And think'st thou not how wretched we shall be,
A widow I, a helpless orphan he!
For sure such courage length of life denies;
And thou must fall, thy virtue's sacrifice.'"

To this appeal Hector replies, by pleading the necessity of defending his country and his honour; then, after alluding, with a sigh, to the destined fall of Troy, he exclaims,—

"'And yet no dire presage so wounds my mind,
My mother's death, the ruin of my kind,
Not Priam's hoary hairs defiled with gore,
Not all my brothers gasping on the shore:
As thine, Andromache! thy griefs I dread;
I see thee trembling, weeping, captive led!'
* * * * *
Thus having spoke, th' illustrious chief of Troy
Stretch'd his fond arms to clasp the lovely boy.
The babe clung crying to his nurse's breast,
Scar'd at the dazzling helm, and nodding crest.
With secret pleasure each fond parent smil'd,
And Hector hasted to relieve his child;
The glittering terrors from his brows unbound,
And placed the beaming helmet on the ground."

Our own Shakspeare has handled this subject with equal felicity in the scene of the first part of Henry IV., between Percy Hotspur and his wife, on the eve of the battle of Shrewsbury. It is this scene that the painting of which we give an engraving more appropriately illustrates—at least, so far as the armour of the warrior is concerned.

THE WARRIOR'S FAREWELL.

THE KALMUCKS.

These people have not a shadow of their original independence; they belong to Russia, are ruled by Russian law, and governed by Russian superintendents. The authority of St. Petersburg is felt in their encampments, and this nomad people, these children of the wilderness, have learned submission to the Czar. Perhaps they have reverence for the Cossack bayonets, which, according to General Weljaminoff, would uphold the heavens if they dared to fall.

The territory of the Kalmucks is not great, and stretches out on the left bank of the Volga. It is bounded on the north and the east by this river, to the west by Egorlick, and to the south by Kouma. The principal occupation of the people is that of cattle, and Kalmuck horses, camels, bullocks, and sheep, are highly prized in the surrounding districts.

The nation is divided into three classes—nobles, peasants, and priests. The ecclesiastics belong to neither the higher nor the lower order, but are distinguished from both, while revered by all. Their religion is a species of Buddhism. They believe in one great governing principle—a supreme God, ruling over all things, who is too high and great and wonderful to be represented by any tangible object, and of whom, therefore, no image must be made, and in whose honour no

idol must be worshipped. The orders of secondary divinities are generally represented by the figures of females, and are supposed to have parcelled out the universe among themselves and each to rule over his allotted portion. The priests are divided into four classes: the Backhaus, or high priests; the Ghelungs, or ordinary priests; the Guetzuls, or deacons; and the Maudchis, or musicians; the grand Lama of Thibet is the head of their church. When a Kalmuck worships, he sings a species of sacred song, a low monotonous repetition, turning at the same time a kind of drum or cylinder, covered with sayings from their sacred books, and to which cylinder a long cord is attached; this praying and turning, much the same by the way as counting one's beads, is called by travellers *grinding prayers*, and the mechanical contrivance for ascertaining the number of supplications offered, a *prayer-mill*.

The *cuisine* of the Kalmuck is not over delicate, and not remarkable for its power of tempting a listless appetite; it chiefly consists of roasted horse-flesh, a preparation of thick milk, and tea; not such tea, however, as that to which we are accustomed, being a hasty mixture of salt, milk, chopped tea-leaves, and boiling water; the whole of a reddish-yellowy colour, and which commonly closes the repast. Their favourite beverage is brandy and warm milk.

The dwellings of the Kalmucks are the same at the present time as they were in the days of Herodotus. They are round in form, termed by the people *kabitkas*, and are surmounted with conical roofs, pierced at the centre for the escape of the smoke. Two camels suffice for the transport of a tent large enough for the accommodation of a whole family, with the whole of the furniture, arms, provisions, kitchen utensils, &c.

The manufacture of felt, gray and white, is the principal industrial occupation of the Kalmuck people.

"It is easy," says Pallas, "to distinguish by the traits of physiognomy the principal Asiatic nations, who rarely contract marriage except among their own people. There is none in which this distinction is so characterised as among the Mongols. If the colour is set aside, the Mongol has as little resemblance to other people as a negro has to an European. This peculiar conformation is distinguished particularly in the shape of the skull of the Kalmucks; but the Mongols and the Bouriœts have so great a resemblance to them both in their physiognomy, their manners, and moral economy, that whatever is related of one of these nations will apply as well to the others. The Kalmucks are generally of a moderate height. We find them rather small than large. They are well made, and seldom deformed. They entirely abandon their children to nature: hence they are all healthy, and have their bodies well proportioned. They are generally slender and delicate in their limbs and figure. I never saw a single man amongst them who was very fat."

The characteristic traits in all the countenances of the Kalmucks are, eyes of which the great angle, placed obliquely and downwards towards the nose, is but little open and fleshy; eyebrows black, scanty, and forming a low arch; a particular conformation of the nose, which is generally short, and flattened towards the forehead; the head and face very round. They have also the transparent cornea of the eye very brown; lips thick and fleshy; the chin short; the teeth very white—they preserve them fine and sound until old age. They have all enormous ears, rather detached from the head.

KALMUCKS AT PRAYER.

From the foregoing remarks, it might appear that all the Kalmucks were hideous and deformed. We see, on the contrary, among the men, as well as the women, many round and very pretty faces—faces that would find admirers in any part of Europe.

The number of Kalmuck families in Russia was estimated by Pallas at 8,229; but the nation is more widely dispersed over the globe than any other, even the Arabs not excepted.

FRENCH NOTIONS OF ENGLISH POLITENESS.

THERE is scarcely anything more amusing and instructive than to hear what foreigners have to say of us. Even their most outrageous blunders are well worth reading for the fun they afford, while many a useful lesson may be learnt from their just criticisms. A specimen of this sort has lately appeared in the shape of an article entitled "English Politeness," in a contemporary French publication; and as we think our readers may be glad to know its contents, we will favour them with as faithful a translation as we can.

Our title ("English Politeness"), says the writer, is not a mere epigram, but what it expresses really does exist. English politeness has even genuine and solid qualities, although it operates in a very limited circle, and its outward developments are by no means brilliant. To discover and appreciate it, one must study it closely, and by the domestic hearth, so to speak. Hence we find it is extolled by those who have been admitted into close intimacy with English life, while its very existence is positively denied by foreigners who have only distant and temporary connexions with the English, such as are formed during a journey or a passing visit to the streets and monuments of London.

The politeness of a Frenchman is universal. Everywhere and with everybody it is smiling, active, and eager. A Frenchman is polite even to people whom he does not know, and has never seen—whom he meets quite by accident, and, according to all appearance, will never meet again. He does not wait to be asked one of those small offices of kindness the mutual exchange of which gives such a charm to the relations of social life. He anticipates desires, offers his arm, and gives way to an old man, a woman, or a child. His first impulse is, to place himself at their disposal if he sees them in any difficulty, without stopping to consider what is their rank, fortune, or nation, and without heeding the inconvenience to which he may subject himself. It is a natural benevolence, an instinct, that urges him on. His innate disposition so orders it. He practises without effort, and almost without thinking of it—even in matters apparently the most trivial—the grand and noble maxim of Menander, as expressed by Terence: *Homo sum, nihil humani a me alienum puto*, "I am a man, and consider nothing that concerns humanity without interest to me."

An Englishman, on the contrary—our remarks are, of course, subject to numerous exceptions in both countries—does not even appear to comprehend this incessant expansion of French politeness. Far from wishing to imitate it, he does not value it. To him it appears thoughtless, exaggerated, indiscreet. He looks upon it as a want of dignity and self-respect, to rush with sudden ardour into the service of everybody without waiting to be asked.

We remember having seen in a caricature, a gentleman eying, with a most impassive air, a poor fellow who is drowning, and excusing himself for not rushing to his assistance by the reflection—"I don't know him; he has never been *introduced* to me." This is rather too cruel a joke. An Englishman of the better sort will not hesitate to render valuable service in serious difficulties: he will expose his life—and sometimes, even his purse! But in ordinary circumstances, it is vain to expect him to go a single step out of his way, to give up an inch of his seat, to stand on one side, to hold out his hand, or to make the slightest sacrifice of his ease or convenience in behalf of strangers, though they be his own countrymen. "Every man for himself," is his maxim in everything that does not involve greater interests than those connected with common civility, complaisance, and agreeableness; and the custom of his country justifies him in not putting himself to the smallest inconvenience for anybody who has not been *introduced* to him.

"To be introduced" is consequently an affair of importance in England. It is a formality which gives a claim to regard, as well as to certain services. It is subject to certain rules, which persons who are polite, after the English fashion, are careful not to violate; and it must be admitted, that some of these rules are really reasonable.

For instance, one ought never to introduce a person to another unexpectedly, without being fully assured that the introduction will be agreeable to both parties. We are not so particular about this in France, for the simple reason that with us the ceremony of an introduction involves no obligations. We need hardly take off our hat to a person who has been introduced to us by name during a walk or at a large party, and with whom we have merely exchanged civilities on a single occasion. It is not so in England; but one who has been introduced to you in a regular way would be justified in feeling offended if you afterwards appeared to forget him, or if you denied him one of those small services which are accorded to people of one's acquaintance. But there must have been a regular introduction. A conversation with a stranger in a public place, or even in the house of a common friend, however lengthened, familiar, and cordial it may have been, is never equivalent to a proper introduction. A gentleman whom you should venture to accost simply because he chatted with you for an hour yesterday on board a steamer, or at a *restaurant*, would look at you with an air of blank astonishment and indifference, and turn his back upon you. He does not know who you are; "you have not been *introduced* to him."

It is very unusual, too, for an Englishman to speak to a stranger in a coffee-house, at the theatre, in the street, or even in a public vehicle. If you venture to make advances to him, he will in all probability display an offensive mistrust and suspicion.

In France we conduct ourselves in the like circumstances altogether differently. We sincerely believe the majority of our fellow-men to be worthy of our sympathy and esteem. We have confidence in them. It is painful to us to exhibit coldness or suspicion. Dishonesty, want of principle, motives of interest, ill-will, or treachery, never occur to our minds—or, at least, very rarely. Why should we suspect their existence? Why, out of an exaggerated respect for ourselves, or an offensive and unwarrantable distrust, deprive ourselves of that free and agreeable exchange of thoughts and feelings which excites reflection, extends our knowledge, multiplies our points of observation, and establishes a communication between minds which are already too much estranged from each other by insurmountable obstacles?

The foreigner who goes to England with a letter addressed to the head of a family by a person fairly entitled to write it, is sure of a reception as kind and as warm as he would have a right to expect from one of his nearest relations or best friends. He is treated as a welcome guest, and all his wishes are eagerly anticipated. He is waited upon the first thing in the morning to make arrangements for spending the day; he is conducted and accompanied to all the places he wishes to visit, without being allowed to bear any part of the expense; for he is never permitted to open his purse. In vain he entreats, in vain he declines these kind attentions; his entertainers think nothing of them; and it seems as if, during his stay with them, they had desisted from all business or other occupation of their own, in order to lay themselves out entirely for his service. To do him honour, they invite to their house all the persons of distinction with whom they are acquainted, and testify to him, by a thousand attentions, that he is really the hero of these entertainments. In this way the foreigner, whether he will or no, contracts obligations towards his English host which it will be scarcely possible for him ever to discharge. In Paris there is no one—unless he be quite at leisure—who can find time enough to accompany a foreigner for several days, and be his *cicerone* at all times, and in all the public promenades of that capital. We think we have done our duty to him when we have received him at table and accompanied him to the theatre, though we have not repaid him a hundredth part of his attentions to us. These hospitable customs of the English, which have withstood all the changes of civilisation, are really worthy of admiration; it is not a superficial politeness, unaccompanied by genuine feeling; and we must frankly admit, that in this respect our neighbours have decidedly the advantage of us.

THE TIGER AND THE BOA CONSTRICTOR.

Contests between animals of different species are characterised at times by very great ferocity, as in general they originate in a desire, on one side at least, to effect the utter destruction of the other, with a view to procuring thus an article of food. When a fight takes place between a boa and a tiger, they are well matched, as they are about the two most ferocious animals in existence. If the lion, by his majesty and port, is entitled to be called the king of animals, the tiger is the type of the blood-thirsty and savage despot, the Nero and Caligula's of the earth!

The animal at one time was little known; but thanks to such institutions as the Zoological Society, it, as well as others less known in the animal creation, has become familiar, while its history has been diffused through many channels.

The habitation of the tiger is Asia. There, in the forests, and hills, and jungles yet unconquered by civilisation, it holds its court, and lords it over the lesser animals. It dwells, too, in the deserts which separate China from Siberia, in China, and says one writer, "it inhabits Mount Ararat, and the Hyrcania of old, famous for its wild beasts; but the greatest numbers, the largest, and the most cruel, are met with in India and its islands. In Sumatra, the natives are so infatuated that they seldom kill them, having a notion that they are animated by the souls of their ancestors. They are the scourge of the country; they lurk among the bushes on the sides of rivers, and almost depopulate many places. They are insidious, blood-thirsty, and malevolent, and seem to prefer preying on the human race." Marsden, in his valuable work on Sumatra, tells us, that the number of people slain by these rapacious beasts is incredible, and that some persons have been led to try a method of killing them. These traps are very ingeniously contrived. Sometimes they are in the nature of strong cages, with falling doors, into which the beast is enticed by a goat or dog, enclosed as a bait. Sometimes they manage so that a large beam is made to fall into a groove across the tiger's back; at other times it is noosed about the loins with strong ratans, or led to ascend a plank nearly balanced, which turning when it has passed the centre, lets the animal fall upon sharp stakes prepared below. It is our own dominions in India, however, that are the head-quarters of this pestilent animal—there he hides in the jungle, there it is that he comes darting forth upon the unwary traveller, with that wonderful and terrible bound, which is scarcely to be resisted, and deals that gripe which makes the buffalo quail, and even alarms with panic-terror the huge elephant itself. Its swiftness is remarkable. In Singapore, a man is killed by a tiger every day, on an average. Pliny, who in many things was most observing and correct, alludes to this quality, which has been denied. But modern travellers have proved the extreme correctness of Pliny's remark when he says, "animal tremendæ velocitatis,"—as they have all agreed to allow its great velocity or speed. It will outstrip the swiftest horse in the chase, and can only be captured by artifice, or by being surrounded.

There has been great question as to whether the tiger is or is not brave, and anecdotes are related on both sides of the question with great zest. The summing up of all evidence seems to convey an impression that, under many circumstances, the tiger is hardy in the extreme, while some creatures of the kind are timid and irresolute. That some of them have dogged courage, there can be no doubt. Father Tochard's description of a combat between a tiger and two elephants, at Siam, is tremendous. He says* that two elephants were introduced, with their heads and trunks defended by a shield. The tiger was let in upon them, tied, however, with cords, and thus held until the elephants had beat the breath out of him with their trunks. Then he was let loose. Up he flew, with his terrible bound, and a still more terrible roar, at the trunk of the animal which was nearest. The elephant was ready, met him on his tusks, and dashed him back. This could only check the tiger, because it disabled him, and the elephant continued his combat for some time with three fresh tigers.

It is the tigress that is brave indeed when her young are in danger. In India, a captain had two tiger cubs brought to him, which he put in a stable. They had been stolen in their mother's absence. When night came on, her furious cries were heard without, and so desperate were the efforts of the furious tigress to enter the house, that the alarmed inhabitants gave up the cubs in the utmost terror.

Ten rupees were once the reward for capturing a tiger in the territories of the East India Company, though, so terrible are its depredations, that no mercenary incentive seems wanting to tempt men to its chase and destruction. Animals are not its only prey: man is not safe, and children are but morsels in its devouring maw.

The Bengal tiger is easily distinguished from all other species by his transverse dark stripes. He is thinner and lighter than the lion; the upper part of the body is yellow, the under part white; the whole internal face of the ears, and a spot on the external surface round and over the eyes, the end of the muzzle, cheeks, throat, neck, chest, belly, and internal sides of the limbs, are white; and the tail is annulated with black on a whitish-yellow ground. The pupils of the eye are generally said to be round.

Tigers have been sometimes tamed to a wonderful degree, and in Madras people sometimes take round a tiger for exhibition, which is occasionally supplied with a sheep or other animal to display its strength upon. All its wild ferocity is thus shown, its leaping power, its savage way of eating; and yet to its keeper it is tame and gentle. Still, though in the museum of Paris and elsewhere we have known tigers as tame as dogs, they should never be wholly trusted. The smell and sight of blood will generally arouse all their worst and most terrible instincts.

The very young tiger is about the size of a kitten three months old, which it very much resembles. But it soon grows and becomes as dangerous as it is at first harmless and weak.

A tiger hunt is one of the most exciting scenes that can be imagined. Captain Mundy describes one with great effect. He says: "On clearing the wood, we entered an open space of marshy grass, not three feet high; a large herd of cattle were feeding there, and the herdsman was singing under a bush, when, just as the former began to move before us, up sprang the very tiger to whom our visit was intended, and cantered off across a bare plain. He took to the open country in a style that would have more become a fox than a tiger, who is expected by his pursuers to fight and not to run; and as he was flushed on the flank of the line, only one bullet was fired at him ere he cleared the thick grass. He was unhurt; and we pursued him at full speed. As soon as he felt himself wounded, the tiger crept into a close thicket of trees and bushes, and crouched. My mahout had just before, in the heat of the chase, dropped his ankor or goad, which I had refused to allow him to recover, and the elephant being notoriously savage, and further irritated by the goading he had undergone, became consequently unmanageable; he appeared to see the tiger as soon as myself, and I had only time to fire one shot, when he suddenly rushed with the greatest fury into the thicket, and falling upon his knees, nailed the tiger with his trunk to the ground." The sportsmen afterwards killed him.

The tiger, like the lion, belongs to the genus Felis, and is called *Felis tigris* in the clear monograph of the genus Felis by Temminck.

The *boa*, of which we have already spoken, is very large, but not so large as the ancients would have us believe. Aristotle speaks of African serpents as long as vessels, by which a

* Tochard, Reise vach Siam. 1747.

galley with three oars might have been overturned. Pliny talks of Indian serpents capable of swallowing deer. Ælian mentions dragons of eighty to a hundred cubits in length; and Suetonius declares that there was exhibited at Rome, under Augustus Cæsar, a living serpent of fifty cubits in length.

TIGER ATTACKED BY A BOA CONSTRICTOR.

They are, really, about thirty or forty feet long, and will, it is said, swallow dogs, deer, and even oxen. The boa belongs to the order *Ophidia*. The *Boa Constrictor* proper is said not to be found where the tiger is common; and recent travellers assert, the huge snake, known in India to attack such animals as the tiger, to be a python. They inhabit aquatic situations, placing themselves in ambuscade on the banks of rivers, where animals come to quench their thirst. Rolled upon themselves in spires, they form a disk of seven feet in diameter, in the centre of which the head is placed. They thus await their prey in a motionless position, only raising the head occasionally some feet above this sort of spiral, to observe if any animal approaches. As soon as they imagine it within reach, they shoot forth like a spring. They twirl round its neck for the purpose of strangling it, in which they generally succeed. They have been known to stop a man on horseback by a sudden dart from a tree, to which their tail remained fastened. The above engraving represents a very common occurrence.

REV. WILLIAM JAY.

"Simple, grave, sincere,
In doctrine uncorrupt, in language plain,
And plain in manner; decent, solemn, chaste,
And natural in gesture."—*Cowper.*

To have reached the almost patriarchal age of eighty-five years; to have occupied for upwards of sixty of those years the responsible station of teacher of a large and intelligent Christian congregation, occasionally visiting other congregations, and everywhere popular, respected, and beloved; and, at length, to close a long career of usefulness by a calm and peaceful death, is a rare and distinguished honour. This honour, however, was conferred on the subject of this brief memoir.

REV. WILLIAM JAY.

William Jay was born of humble parents in the village of Tisbury, Wiltshire, on the 1st of May, 1769. During his boyhood, he assisted in supporting himself by manual labour. But having, when, we believe, about fifteen years old, attracted the attention of the Rev. Cornelius Winter, of Marlborough, a dissenting minister, who was much engaged in preparing young men for the pulpit, William was placed under the care and tuition of that gentleman, with a view to his preparation for the office of the Christian ministry. Such were his natural talents, and so rapid was the proficiency he made in his studies under the careful and affectionate training of his exemplary tutor, that before he had attained his sixteenth year, he began to exercise his talents as a preacher. A youth of ruddy complexion, with glossy raven locks overhanging his shoulders, and his shirt collar loosely fastened with a black ribbon, he stood before an audience for the first time, in the village o Ablington, Wiltshire; and, as he himself has stated in one of his publications, he delivered nearly one thousand sermons before he had reached his twenty-first year. He continued to preach at various places in Wiltshire, and for nearly twelve months at Lady Maxwell's chapel, at the Hot Wells, Clifton, with a view to his settlement over the congregation assembling in that place. During a portion of that period, he officiated at Argyle Chapel, Bath, for the Rev. Mr. Tuppen, who soon afterwards died. Mr. Jay then received a unanimous and pressing invitation to become the stated minister of that place, which invitation he accepted; and on the 30th of January, 1791, being then in his twenty-second year, he was ordained pastor of the church and congregation, according to the form usually observed by Protestant Dissenters.

Mr. Jay's pulpit labours soon became an object of consider-

able attraction. Mr. Dyer, his successor, says: "Strangers and visitors, Episcopalians as well as others, came to hear him. In time, men distinguished not only by station but by fame, as orators and statesmen, divines and poets, were occasionally seen among his auditors. Fox, and Burke, and Sheridan, and Wilberforce, as well as many others of less note, heard the word from his lips. The latter renowned philanthropist was greatly attached to him, heard him on every possible occasion, and corresponded with him on subjects of high importance. Hannah More was one of his regular hearers. Sheridan described him among friends as 'the most perfectly natural orator he ever heard.'"

For nearly half a century, Mr. Jay was accustomed to visit the metropolis annually, for a month or six weeks, confining his preaching chiefly to the congregation of the Rev. Rowland Hill, at Surrey Chapel. His popularity was established from his first appearance in that place, and it was maintained to the very last. And so generally was he regarded as a model of pulpit excellence, that ministers of all denominations eagerly embraced opportunities of hearing him, especially on week-days, when liberated from their own stated engagements.

In 1841, Mr. Jay completed the *fiftieth* year of his ministry at Argyle Chapel. This event was celebrated, first in the chapel, and afterwards at a public breakfast, at which upwards of eight hundred persons attended. A testimonial of respect was presented, consisting of a salver with an appropriate inscription, and a purse containing £650. Soon after this period, his natural energy began to abate; but, with the help of an assistant, he continued till August, 1852, to conduct a portion of the services with great regularity and energy. On the eighth day of that month, he preached his last sermon in Argyle Chapel. He then left home for Worthing with some members of his family, and while there he became seriously ill. He rallied sufficiently to return home, but never recovered. In October last, he informed his people of his intention to resign his office on the 30th of January, 1854, that being the anniversary of his ordination. His people had no alternative but to accept his resignation, which they accordingly acknowledged in a resolution couched in terms of deep respect. At the same time, an annuity of £200 was settled upon him. He passed nearly two months in severe and almost constant pain, but his mind remained collected and vigorous. On the evening of Tuesday, December 27, he sank tranquilly into the arms of death, in the eighty-fifth year of his age.

Mr. Jay is described by those who knew him well, as "a man of catholic mind and heart. Clear in conception, vigorous in utterance, possessing a commanding and impressive elocution; and giving himself heart and soul to his work, especially to the pulpit." As a speaker, his voice was full, deep, and melodious, almost immediately arresting and fixing the attention of the hearer; and his power of modulation was such, that the pronunciation of a single sentence often impressed itself indelibly on the memory. His action and gesture were elegant and forcible.

Mr. Jay's published works are numerous, extending to twelve octavo volumes; consisting of sermons, biographies, a series of family devotions, and an essay on marriage. His volume of sermons, entitled "The Christian Contemplated," may be considered as his most finished performance; and as it did not appear till the year 1824, it contains the results of long study, extensive observation, and deep experience. In an introduction of great length, he criticises, sternly but judiciously, what he conceived to be the defects of much modern preaching, and justified his own style against the remarks of some carping critics. All his writings possess deep interest. His sermons, in addition to their sincere piety, are distinguished by strength of reasoning, depth of thought, familiarity of illustration, and simplicity of language often bordering upon quaintness. His biographical sketches are faithful records of those whose lives are portrayed, interspersed with pithy practical remarks and exhortations. A volume of lectures by him, on the character of some of the females named in Scripture, received the final corrections from his own hand but a few days before his death, and will shortly be published. He had been for some years preparing an autobiography entitled "Reminiscences of my own Life and Times," which he had brought down to a very recent period. The manuscript, it is said, is confided, for the purpose of publication, to the editorship of the Rev. J. A. James, of Birmingham. This work is expected to excite more than usual interest, not only because of the period over which it extends, but from the notices of distinguished individuals it must necessarily include, and from Mr. Jay's well-known talent of observation and illustration.

A FEW WORDS ON THE FUNGUS TRIBE.

CHAPTER I.

The fungus tribe is an important and most remarkable division of the vegetable kingdom, singular in structure, and many of the species exquisite in form and colouring, whilst others are calculated to be extremely valuable as articles of diet or of medicine. The range of growth of the species of this remarkable kind of vegetation is as surprising as the variety in size, form, and colour, which they exhibit. We wander in the dewy meadows in autumn, and we find the grass studded with mushrooms, some eight or ten inches in diameter, others but half developed and looking like little bunches of buttons on the ground; we see broad rings in the grass, of a deeper green and coarser herbage than other parts of the same field display, and we know them to be the "fairy-rings," which were formerly supposed to have been formed by the midnight gambols of the fairies, when, with nimble feet, they tripped in mystic dance beneath the moonbeams; those whom Prospero thus adjures:—

> "You demi-puppets, that
> By moonshine do the green sour ringlets make,
> Whereof the ewe not bites;—and you whose pastime
> Is to make midnight mushrooms."

These dark rings are now known to be caused by the growth of fungi, which, it is supposed, spread outwards from a centre, every year of their growth exhausting the soil of the circle which they have occupied, and throwing out fresh germs to one beyond, in which they grow the next year, and then again push beyond it, and occupy a wider stretch in each succeeding year. As we pursue our ramble, and penetrate into the wood, we look above us, and see huge fringes of fungus growth hanging out from the trunks of the trees, and on the decayed stumps around we perceive the most exquisitely tinted clothing of what, by the sea-side, we should conceive to be shells clustered in shelves one above the other, and all grouped in the most vigorous and beautiful forms; we touch them, and they are wood-like; we take a chisel and hammer, and such hard work is it to chip them off, that we find it easier to take bark and all than to sever these parasites from the trunk on which they have fixed themselves. These beautiful objects are the fungi. Some of them in form and pencilling much resemble the beautiful sea-weed, *Padina pavonia*, but their painting is different and consists of broad bands of black, delicately shading into gray or lavender, and alternating into a soft orange colour, the texture of the upper surface being velvet-like the wing of a moth, and the lower part of a cream white, full of minute pores which give it much the appearance of coralline formation.

We have had clusters of them brought us from the woods, so beautiful as to induce us to group them as nearly as possible as they would appear in their native habitat, and arrange the

for a basket for flowers; and when set off by a massive bunch of roses or dahlias, this structure formed an object as beautiful as it was curious, and lasted for very many months perfectly unchanged in form or colour. Besides these, and a thousand other varieties which infest trees, posts, &c., are a multitude of lovely little gems of all hues, which lie scattered about on the bare heath, or spring out of decayed leaves, bits of stick, wood, &c. Some are scarlet, others orange, snow-white, black, brown, purple, rose-coloured, or green—all glittering in the moisture beneath the bright autumnal sunbeams, and looking like so many jewels. Every object is more or less infested by this ubiquitous race; some spread themselves over our fruits; others attack our bread, cheese, pickles, or other manufactured articles of food. "When our beer becomes mothery," says Dr. Badham, "the mother of that mischief is a fungus; if pickles acquire a bad taste, if ketchup turns ropy, and putrefies, funguses have a finger in it all. Their reign stops not here, they even prey on each other. The close cavities of nuts occasionally afford concealment to some species; others, like leeches, stick to the bulbs of plants, and suck them dry; some (the architect and ship-builder's bane) pick timber to pieces as men pick oakum. The *Oxygena equina* has a particular fancy for the hoofs of horses and the horns of cattle, sticking to these alone. The belly of a tropical fly is liable in autumn to break out into vegetable tufts of fungous growth, and the caterpillar to carry about in his body a *clavarias* bigger than himself." We have ourselves seen several specimens of a curious Australian fungus, consisting of a sort of stem, about an inch and half high, with a bunch of berry-like appearance at its summit. This takes its root in the head of a species of huge caterpillar, which, having burrowed in the earth preparatory to changing to the pupa state, becomes the prey of the fungus; and so firm is its hold, that when the latter is pulled from the ground, the caterpillar on which it has fixed itself comes up with it.

Almost every earthly thing is liable to be infested with some species or other of this tribe; the human teeth produce them, and the wounded flesh of living men. But we must forbear, for we might fill a large volume, were we to attempt to describe all the strange and varied situations which fungi select for their own especial habitations and sustenance.

The structure of the fungus tribe is most peculiar, and differs *in toto* from that of any other. Their whole substance may be considered as a mass of reproductive matter. Link, a noted writer on this order of *cryptogamic* plants, defines the essence of a fungus to be "sporules disposed in a series in elongated tubular cells, the cells situated in some part of the external surface." The spores of fungi answer to the seeds in other plants; they consist of round, oval, oblong, or occasionally other shaped bodies, so minute as in most cases not to be distinguishable by the naked eye, but displaying, when viewed with a microscope, various colours, pink, purple, yellow, or white; they are sometimes naked, but more frequently closed up in little receptacles, those of regular form being called *thecæ*, and those of irregular form *sporanges*. When ripe the spores are either ejected from these little cases with a jerk, caused by the bursting of an elastic ring which encircles them, or else they return to the earth with the dissolving substance of the fungus in which they have existed. In the puff-ball (*Lycoperdon geastrum*, &c.) and in some other tribes, the spores are wholly internal, and in such prodigious numbers as quite to fill the cavity of the fungus, and to burst out from its centre, when pressed, like a dense smoke. Of such structure is the *Lycoperdon stellatum*, or Stellated Puff-ball, of which we give a cut (fig. 2); the spores issuing in a column from the chimney-like aperture when the bag below is pressed, so suddenly and so high in proportion to its size, as to be quite startling. It would be occupying too much space were we to attempt to give any detailed account of the mode of development of these spores, or of other parts of the structure of this wonderful tribe; we must, therefore, refer such of our readers as desire deeper information on these points, to more learned and elaborate writers on the subject, and restrict ourselves to the single object of supplying a few such facts connected with the appearance and habits of some of the genera, as may serve to interest the general reader.

"What geometry shall define their ever-varying shapes? Who but a Venetian painter do justice to their colours?" says Dr. Badham, in his very interesting work "On the Esculent Funguses of England;" and well may he challenge competition with this Protean family. "As to shapes," he adds, "some are simple threads, like the *Byssus*, and never get beyond this; some shoot out into branches like sea-weed; some puff themselves out into puff-balls; some thrust their heads into mitres; these assume the shape of a cup, and those of a wine-funnel; some, like *Agaricus mammosus*, have a teat; others, like *A. clypeolarius*, are umbonated at their centre; these are stilted upon a high leg, and those have not a leg to stand on; some are shell-shaped, some are bell-shaped, and some hang upon their stalks like a lawyer's wig. Some assume the form of a horse's hoof, others of a goat's beard; in the *Clathrus cancellatus*, you look into the fungus through a thick red trellis which surrounds it." Besides these marvellously varied kinds, there are others: one formed like a nest, another like an ear. "One," says Dr. Badham, "is so like a tongue in shape and general appearance, that in the days of enchanted trees you would not have cut it off to pickle or eat on any account, lest the knight to whom it belonged should afterwards come to claim it of you."

The *Clathrus cancellatus*, of which we before spoke, is a most remarkable fungus. Its lower member, as exhibited in the cut (fig. 1), is white, the upper lattice-like part a bright coral hue. It has only been found in two places in England, being an inhabitant of the south of Europe. Those two places are the Isle of Wight and Torquay; in this last-named place it has been found in two localities. Mrs. Griffiths says, in describing those first discovered: "It appeared in Mrs. Travers' garden at Torquay, in rich reddish earth, formerly a plantation. When Mrs. Travers gathered the fungus, it was in a ball, and before she could bring it into the house it had burst up to its height. The scarlet part had a most vivid colour till the darker part decomposed. I was so very much annoyed by the stench, that I could not take more pains with the drawing." Last autumn (1853) other specimens were found of this curious plant in another part of Torquay.

Another of our cuts (fig. 3) represents that most brilliantly beautiful species *Agaricus muscarius*. Few objects can be more splendid than a cluster of these richly-tinted fungi, when they have been allowed to attain any size without being preyed on by slugs or other enemies. The pileas, or cup, is of a vivid orange-red, though sometimes more inclining to a carmine hue, and over it are scattered angular warts of a snowy whiteness. It rises first from the earth in a conical form, then after a time the pure white veil which connects the edge of the cup with the *stipes*, or stem, gives way, and falls back, discovering the pale lemon-tinted gills which lie beneath it. The root is bulb-shaped, and the fungus, when extended fully, often five or six inches in diameter, standing on a velvet-like white stem of several inches in height. It is highly poisonous, and is used by the Russians to make an intoxicating potion, called "*moucho more*," which they use to produce a kind of delirium. The coal-mines of Dresden exhibit the interesting phenomenon of fungi which emit light like pale moon-beams; and Mr. Gardner states, that whilst passing along the streets of a Brazilian town, he "observed some boys amusing themselves with what appeared to be large fire-flies, but which proved, on inspection, to be a fungus belonging to the genus *Agaricus*, which gave out a bright phosphorent light of a pale green." He next day obtained considerable quantities, and found that a few of them in a dark room were sufficient to read by. Of a few of the varied *forms* of this singular tribe our cuts and descriptions may have given some little idea; but to supply the least notion of the exquisite and most vivid tinting, the soft pencilling and shading which these singular productions display, would baffle the most skilful painter. Their hues are as varied as they are lovely; in one tribe alone, the *Agarics*, we find crimson, flecked with white, violet, rich orange, scarlet, yellow of every tint, green,

pure white, brown of all shades, and a thousand other dyes; over the spreading caps of some of the species of this genus are scattered snow-white warts, some are marked with geometrical figures, and many kinds are covered with a glossy varnish which gives to them almost a metallic lustre. In texture they also greatly differ, some species being so leathery and firm, that they can be sewed together; the *Amadou* is of this character, and has been used by a medical practitioner in

be altogether unbearable, whilst others are described as smelling "like the bloom of May." One species smells of onions, another of cinnamon, a third of Tarragon, a fourth of apricots and ratafia. Besides these various olfactory effusions, fungi present us with as illusive and remarkable flavours. To use Dr. Badham's words, "they are sapid, sour, sweet, peppery, rich, acrid, nauseous, bitter, styptic;" a few, and these generally of a dangerous character, have little or no

FIG. 1.—CLATHRUS CANCELLATUS.

extensive sheets for spreading under sufferers from excoriation, it being softer and more elastic than chamois leather. The poor in Franconia, also, make themselves dresses of this fungus. Some funguses are hard as wood, others so brittle that the touch of a finger will break them; some are solid and firm, and others slimy and disagreeable to the touch.

They also present immense diversity in both odour and flavour, some species emitting so disagreeable a smell as to

taste; and there are others whose flavour is unlike that of any other substance in existence, and quite peculiar to themselves—that, for instance, of the mould on cheese, a taste well known to all, and much admired by some.

The expansive growth of fungi, and their varied habitats must next next call for a few remarks. Some of the facts supplied us by authors on the former would be considered as scarcely credible, did they rest on less worthy evidence than

that which attests them. Sowerby states, that he has placed specimens of the *Phallus caninus*, or "stinking morel," on his window over night, in the egg-shape, and found them, next day, fully grown; and another author speaks of his placing *Phallus impudicus* within a glass vessel, and its expanding so rapidly as to shiver the glass to pieces with an explosive detonation as loud as that of a pistol. Carpenter gives an account of a paving-stone, twenty-one inches square and weighing eighty-five pounds, being raised an inch and a half from its station by a cluster of toadstools springing up under it; and many other facts, which attest as well the explosive power as the rapid growth of funguses, are given by different authors, one having been known to attain the size of seven feet five inches in circumference, and the weight of thirty-four pounds in three weeks, and others the weight of twelve pounds in a few days. But none of these statements, remarkable as they are, are so wonderful as one which is made by Sir Joseph Banks of a circumstance which occurred under his own roof.

FIG. 2.—LYCOPERDON STELLATUM. THE STELLATED PUFF-BALL.

He states that a friend having sent him a cask of wine, which was too new and sweet for present use, it was locked up in a cellar to mature. At the end of three years, Sir Joseph, supposing that time had now done its work, proceeded to open his cellar and inspect its contents. Little did he think how *time* had been employed, and little did he conceive what would be the contents of that cellar. The door refused to open, and being invincible by gentle means, he had it fairly cut away; but he was no nearer effecting an entrance than before; the cellar was found to be literally full of fungous growth, which had borne the cask aloft to the ceiling, where it stuck, upheld by funguses, the produce of the wine which had all leaked out and formed this monstrous growth!

But although these monstrous and sudden growths call for our wonder and admiration of the power of Him who can thus produce such huge structures from spores which are invisible to the naked eye, and command that which is so minute to become, in a few hours, an organised structure of such magnitude and such complication of arrangement, we must not let our praise and adoration stop here; for in the minuter growths which we shall soon examine, we shall find as wondrous an exhibition of surpassing skill as in these larger products. The microscopic fungi—those which by fastening on his crops become the bane of the farmer, and are in God's hand a means whereby he can cut off our staple article of food, and "destroy the staff of bread," under the name of "the smut in wheat" (*Puccinia graminis*), or cause our bean or potato crops to

FIG. 3.—AGARICUS MUSCARIUS. THE FLY-BLOWN AGARIC (SMALL SPECIMEN).

perish—are among the most surprising of vegetable productions, and will hereafter engage our attention. We shall, in our next paper, point out the immense supply for the wants of man which might be found in the esculent fungi that our land so freely produces, both spontaneously, and also when cultivated—a supply of which our continental neighbours so fully avail themselves; whilst, in our own country, they are allowed to rot unnoticed in the place where they have sprung up.

THE DEAD BRIDAL.

CHAPTER XIX.

Let us go back to two of the personages of our tale in whom we trust our readers are interested.

Giulio Polani had returned with the troops to Venice, and resumed his intercourse with Bianca without any restraint. In truth, there seemed to be no reason why the young people should feel any restraint. It was natural for them to suppose that the Count Polani would not be averse to their union, and he certainly did not seem to trouble himself about the matter. Alas! his thoughts were occupied too much about his pecuniary difficulties to permit him to be very keen-eyed as to how two young members of his family passed their time; and if he thought of Bianca, it was with the determination that, come what might, he would resist, if possible, the fulfilment of his foolish contract in relation to her.

Upon the day when the count paid the visit to Pietro Molo, Giulio and Bianca sat alone in a *salone* of the Palazzo Polani. The young man looked fondly upon the girl, but his look was full of joy—there was nothing to trouble its happiness, or dim the confiding hope that shone out from his eyes. The girl, with glowing cheek and down-turned eyes, was apparently contemplating, with very profound attention, a fresh rose-bud which she held in her hand, but from which she nevertheless from time to time plucked the young leaves. The case of the young couple was manifest. Even old Giudetta, dim-eyed as

she was, would at once have pronounced them to be lovers, who had told their love, and had nothing now to do but to tell it over again.

"Dearest Bianca," said Giulio, "when you have quite demolished that pretty rose—which hath done you no wrong that I know of, save that it too is fair—will you do me the favour to let me know whereon your thoughts are so busy for the last minute and a half?"

The girl looked up and smiled, but her smile had somewhat of sadness in it.

"I thought, dear Giulio, how very happy I am; and then came a something over my spirit that made me sad and fearful, lest such happiness was too great to be long-lived: one is sure to find a cloud crossing the heart when it is glad, as the shadow is always the darkest when the sun shines most brightly."

"Nay, nay, dear one, not so shall it be with us: ours shall be the sunshine of the long, long summer day; no cloud save those that will deck heaven in gold and purple—no shadows save those that bring freshness and repose."

"Ah! that it may be so, Giulio; and yet I have some reason to fear——"

"How?—where?—from whom? Tell me at once, Bianca. My father surely will not disapprove——"

"I have no cause to think he will; but—— Come, I will tell thee what has disturbed me. It was but yesterday that, as I sat in the balcony overlooking the canal, watching the gondolas pass by, one with a band of minstrels in it stopped beneath my window, when a girl began to sing to the music of a rebeck. After her song was ended, I gave her a guerdon, and she cried to me in a merry voice, 'Thanks, dear lady; mayst thou have a happy bridal and a speedy.' At this moment the man who played upon the rebeck looked up, and fixed his glittering black eyes upon me, and then he spoke in a deep, sad voice: 'Sorrow, and trial, and darkness! The bridegroom shall come, but Death shall enter at the door with him. He who comes to wed shall go forth without a bride. Sorrow, and trial, and darkness!' I sank backwards with a scream, and when I recovered my composure sufficiently to look down again, the gondola had disappeared. But the words of that man still ring in my ears, and his black, glittering eyes, and his high forehead with the deep scar across it, haunt me incessantly."

"A deep scar across the forehead, didst thou say Bianca?" asked Giulio, and his heart sank within him as he recognised in the description, the ciarlatano, Bartolomeo.

"Yes, dear Giulio, dost thou know such a one?"

"Nay, nay, I did but seek to know some mark whereby I might find the knave that affrighted thee. But dismiss this silly adventure from thy mind. Come, thou shalt sing for me ere I leave thee."

The girl looked up into his face with a smile of trusting love, and while a sigh fluttered upon her lips she took up her mandolin and said—

"Thou shalt hear the newest canzone in Venice, Giulio—They call it

LA BELLEZZA.

O'er a swift, bright streamlet blowing,
A rose stooped down, one day,
To catch, in the limpid waters flowing,
Her blushing image gay;
But the breeze of morn came freshly by,
And brushed the vain rose impetuously,
Rending each tender leaf away.

The leaves fell down the waves among,
And they bore them, rushing for ever along,
Far, far, to the hungry sea—
Thus rapidly, O Heaven, still flies,
Adown time's checkless river,
The loveliness that most we prize,
From our fond eyes for ever."

"Thanks, dear Bianca, a pretty song in sooth, and hath a good moral withal. Well, as Time's river speeds with us all, shall we not do well to float down the stream as smoothly as we can? And now, must I leave thee for a time. Addio, carissima, we shall meet soon again."

And, kissing the hand of his mistress, he departed.

Thus day succeeded day, and March was now drawing to it close; the count Polani sought in vain to extricate himself fro the difficulties that surrounded him. He applied in variou quarters for a loan on his estates, but he found, what many man has found since and before, that in proportion to one' necessities for money is the difficulty of obtaining it. A fe years since he would have met a hundred goldsmiths ready t lend; now there seemed suddenly to be a dearth in the coffer of every one of those sagacious citizens. Somehow they ha all discovered that the count was going down in the world, an they assisted him accordingly to—go down still further. A length, it was within one day of that upon which the bond t Molo would be payable, and the count with all his exertion was able to raise little more than half the amount: to appl again to the banker was, he well knew, useless, and would bu subject him to the humiliation of a refusal. One thing, there fore, seemed certain, that upon the morrow, when old Mol should demand his money, that demand could not be complie with; and then what were to be the consequences? Would th old usurer really seek the fulfilment of the other condition o the obligation?—or would he not rather proceed against th property and person of his debtor and get what he could? Th laws against debtors were very stringent, and Molo might hop in the long run to extract the last farthing; but, on the othe hand, had he not refused all compromise and arrangement, an doggedly announced his determination to abide by the contract and to enforce it too? and, above all, he had procured th license from the council for the marriage of his nephew. Al these things the unhappy count revolved in his mind as he sa by himself that morning in one of the apartments of his palace at length, he started up with the air of a man who has forme some desperate determination.

"I will go to Bianca," he muttered, "I will tell her all she shall know that it is in her power to save me; that I hav sold her, as needy men sell their jewels," he added bitterly "and then let her decide. After all she may, perhaps, thin the hand of a wealthy citizen should not be spurned by a poo noble's daughter. Come, we shall see."

A few moments brought him to the boudoir of the girl.

"A fair morning to you, dear child," said the count, wit an unwonted tenderness as he sat down beside her. "I hav come to intrude upon your solitude. In truth I begin to thin you pass but a lonely life of it here."

"Nay," replied the girl, "it is not so. I am not lonel with so many friends. Have I not yourself at times, and th signora Lucretzia and her daughter Caterina, and my dear ol Giudetto? and more, is not there my brother Giulio?" On who was versed in the ways of women might have detected slight embarrassment in the last words of the young lady but the Count Polani was not much skilled in such matters besides his thoughts were otherwise occupied, and so he di not perceive it.

"Ah, yes, no doubt, Bianca; that's all very well in it way. But thou art now of years to think of other companion ship. Dost know that I have had a suitor for thy hand? Aye and a wealthy one, too."

The maiden's heart beat fast, but she did not speak; coul Giulio, thought she, have disclosed all to his father? After moment's pause the count continued—

"Give me now, my dear child, for a little space, thy atten tion, while I state all to thee. Thou knowest how that i thy early years thou wast committed to my care by thy father my dear friend—how I have nurtured thee even as I hav my own child, and though my habits and sex precluded m attending personally to thee, yet I hope thou hast neve stood in need of aught that kindness could supply."

"You have indeed ever been very good, dear signore," replied Bianca, "and I have had much happiness."

"I rejoice to hear thee say so. Well, the time is now com when it imports thee to know that thy father, when consign ing thee to my guardianship, enjoined upon thee not only i his testament, but also in a writing addressed to thyself, tha thou shouldst be solely guided by me in the matter of th

marriage; that thou shouldst accept no suitor save at my hands, and that thou shouldst yield an entire obedience to my wishes therein, even as thou wouldst to him, if living. Here is the letter, Bianca; thou shalt read it by and by; meantime, let me proceed. Hast thou ever read, my pretty one," continued the count, with an affectation of gaiety that he did not feel, "that, by an ancient law of our republic, he that offered the most money was entitled to the hand of the fairest damsel, and a part of his wealth was assigned by the state as a portion for the maidens who had neither personal charms nor wealth to attract suitors. Well, that old law is abolished, but somewhat of its spirit survives, for the fathers of Venice are wont to think that they best consult the honour and dignity of their houses when they bestow their most beautiful daughters on the wealthiest suitors; and the daughters of Venice are ever obedient to the command of their parents, and recognise the wisdom of the state in making the will of the parent all but paramount."

The count paused a moment. He had, in his own opinion, made a capital opening, and he sought to discover the effect which his words had upon his auditor. In this, however, he was unsuccessful. Bianca listened unmoving, with her eyes turned downwards, and, save from the paleness of her cheek, one could not perceive any symptom of emotion.

"Well, as I said, my dear child, a wealthy suitor seeks thy hand—one whose riches can retrieve the splendour of your ancient, though now impoverished house, and place thee where by thy birth thou shouldst be; for thou knowest how wealth is worshipped in this our state of Venice, and how it can achieve all things. He is young, too, and report speaks well of him as fairly endowed in mind and person. To-morrow this youth—Girolamo Molo, the son of the great banker of Milano, and a citizen of Venice—will seek your hand with my full permission."

"To-morrow!" exclaimed the maiden, looking at the count with an expression of surprise and terror—"surely, dear signore, you cannot mean this! Besides, I am indeed contented to live amongst those whom I now know and love, and desire to form no new ties. Ah! in the name of heaven, let not this be. I beseech you, in the name of my dear parent who placed me in your hands, suffer me to remain as I am at present—were he alive, I should not sue to him in vain."

"What folly is this, Bianca? Here art thou a maiden, of years to become a matron; a hand and a fortune are offered thee which few would reject; and yet wouldst thou decline so fair a proposal, and that without having even seen him who makes it. This cannot be."

The poor girl arose, and casting herself at the feet of the count, burst into a passion of tears. Polani was amazed, and not a little moved by so unexpected an exhibition. Heretofore he had ever found the young girl gentle and submissive to all his requests, and scarce gave her credit for great depth or strength of feeling. He raised her gently, and seating her again beside him, sought to soothe her as best he was able.

"How is this, dear child? It may be that I have disclosed the matter to you somewhat too suddenly. Be comforted, Bianca. Thou hast nothing to fear from me. In the name of that father to whose memory thou hast appealed, I, in my turn, beseech you to hear me. Thou shalt know how deeply thy own honour and welfare, as well as Giulio's, whom thou dost love as a brother, are involved in this matter. I have solemnly pledged myself to the uncle of this youth, which as thy guardian I might lawfully do, that he should have thy hand in marriage; should I fail in my engagement, I am under the obligation to pay upon the instant a large sum of money as an equivalent. That sum I have not, nor can I by any human means procure it. The consequence of my default, I need not tell thee, will be to me imprisonment, confiscation, ruin—to Giulio, beggary, a blasted name, and expatriation."

"Oh! terrible, terrible!" cried the girl, shuddering. "Is there no other means of saving those I love than by sacrificing myself. Ah, dear signore, I will cheerfully give my own poor inheritance towards discharging this obligation. Take it, take it—only spare me the misery of—"

"My dear Bianca, I might not, even if I were willing, avail myself of thy generosity. Thou art not yet of an age to dispose of thy property, and the state would not suffer any one to plunder thee. And now that thou seest the whole matter, this much do I require of thee at least. Receive the visit of this youth to-morrow. Judge for thyself; remember the duty thou owest to me, as filling the place of thy father; forget not that in Venice the child resists not the will of the parent in such things; forget not how much is at stake; and then—yes, dear Bianca—then, I know well, thou wilt act as I would have thee. And now, dear child, I leave thee for the present; thou wilt receive the youth at the appointed time, and I confidently reckon on thy obedience."

It was long before the bewildered girl could compose her mind sufficiently to think with calmness upon this sudden trial. And, in truth, thought brought her but little comfort. The entire subjection to parental authority, in which women were educated in Venice, the mode in which marriages were arranged, as a matter of contract and convenience between the fathers without paying the slightest regard to the feelings of the children, made the conduct of the count appear less tyrannical in the eyes of Bianca than it would in those of a daughter of our own happy land; and the habitual deference which she had ever rendered to every command of the count, would, in all probability, have induced her to have yielded an unresisting obedience in this case, had not her affections been already engaged. But now she clung to her love with all the truth and fidelity of woman's nature—she could not resign it. She felt as though it would be easier to resign life itself. And Giulio, how would he endure the trial?—would he relinquish her without an effort? It was plain, as yet, he was in ignorance of this fatal contract—ah, could he have the means of preventing it?—and then the ruin which her refusal would involve him in: him whom she loved well enough to sacrifice everything for. The conflict between love and duty raged in the mind of the unhappy girl with a fierceness and violence all the greater, that it was unwonted, and her heart was well nigh rent in the struggle. Hours thus passed and found her still sitting in the chair where the count had left her, when the door was gently opened and Giulio Polani entered.

"Why, dearest Bianca, I thought thou must have been at thy orisons. Here have I been knocking, I know not how long, at thy chamber door, and having received no answer, I have been forced to act as my own usher. But, Santissima Madre! what is the matter with thee? Thou art ill, surely."

Ill, indeed, she was; ill in mind and ill in body also. Her eyes were swollen and red with weeping; she was pale and languid, and her head throbbed with a dull, heavy aching. The young man sprang to her side and seized her hand.

"Cielo! dearest, how is this?—thy pulse is weak and fluttering, thy hand is cold—speak, in God's name, and tell me, hath aught happened?"

"Much! much!" cried the girl, and bending her head forward, she sobbed hysterically upon the bosom of her lover.

We shall not pursue the scene further. Let such of our readers draw upon his or her experience, if such he or she have; if that happily be wanting, fancy must supply its place. At length, however, Giulio became acquainted with the full extent of the calamity that impended over both. To relinquish the object of his affection was not to be thought of—what young man like him ever did so in the face of difficulty and danger? When he had offered the best comfort in his power, and the girl was somewhat calm, he said:

"Dearest Bianca, I know that thou art true to our love. Wilt thou be faithful to the end, come what may?"

"To the death, dear Giulio," said the girl, with a solemn energy that seemed strange in one of her gentle nature.

"Then are we not without hope, even wert thou at the altar's foot. Meantime, something may yet be done to discharge my father's debt, even at the last moment. See this note, dearest; I came to make thee acquainted with its import, and now it seems as if heaven has sent this opportunity to me. Thou dost remember the young French seigneur, Jacques de

la Mole, whom I brought to see thee near twelve months since? Well, not half an hour ago, this paper was put into my hands by Tommaso, who had it from a gondolier at the door of the palazzo."

The young man then read the note:—

"Fate brings me once again to Venice, and I am reminded of thee, dear Giulio. Come to me this evening after sunset, I entreat thee by our old friendship. Thou wilt find me at the sign of the 'Croce d'Oro' at Mestre. I do not forget that I am thy debtor, and will repay thee with interest.

JACQUES."

"Now, dearest Bianca," continued Giulio, "I will go to my friend and disclose all to him. I know the amount of my father's debt to old Molo, and I doubt not that Jacques will readily place the sum at my service, as I am well aware that he is wealthy enough to do so without inconvenience. If I succeed—and I know his friendship and generosity too well to entertain a doubt—then shall the old usurer's debt be repaid in good time, and we shall be saved; but, if the worst happen, be well assured that thou shalt not, save with thy own consent, be the bride of another, while I have life and a free arm to save thee. Have a brave heart, then, dearest, while I go to meet my friend. I shall see thee again to-night, upon my return: for the present, addio! May the Virgin have thee in her keeping."

The sun had scarce sunk below the horizon, when the gondola of Giulio Polani, having traversed the lagune, reached Mestre, then, as now, one of the principal approaches to Venice from the north. Despite of the confident assurances with which he sought to support Bianca, his heart was full of trouble and doubt; and as he entered the *osteria* of the "Croce d'Oro," he felt somewhat as a gambler may be supposed to feel who has staked his all upon the turn of the dice which he is just about to cast. Passing through the grooms and servitors that crowded the court-yard, he was shown into a private apartment, and in a moment found himself in the arms of his friend.

"Pardieu, mon cher Jules," said Jacques, after they were seated; "I owe you some apology for my discourteous departure last year; but it was expedient for me to act as I did. Had I not left Venice, I might have been involved in serious difficulties—but of that no more at present. I hope at some future period to be more explicit. And now, cher enfant, tell me all about thyself and thine; and first of all, how is my fair enemy, for so I must call her, seeing that she caused me to lose my wager—thy *sister*; is it not so you call her?" And Jacques smiled significantly; "the signora Bianca I mean."

"Ah! caro mio," replied Giulio with a forced gaiety, "a truce with thy bantering. If thou hast lost thy wager, thou didst find out my secret."

"Aye, Giulio," replied the other, gravely, "and I hold the knowledge cheaply purchased. Ma foi! my own heart would have been lost to the fair one did I not quickly discover that I could not do homage to beauty without being false to friendship. And now, Giulio, having sacrificed so much to my friend, I am entitled to know how fares his love-suit."

"Dear Jacques, my best friend, I acknowledge thy claim. I have come to tell thee all; to consult thee; to tax thy friendship to the utmost."

Giulio then recounted the mutual love of himself and Bianca, how they had bound themselves irrevocably to be faithful to that love, how their happiness was now imperilled by the embarrassments of the count's affairs, and the singular compact which he had entered into with old Pietro Molo. To all this his auditor listened with profound attention, nor did he suffer an expression of any sentiment to escape his lips till Giulio came to an end. Even then he continued silent for some time, and then asked—

"What did you say was the name of the banker? Molo, was it not Molo?"

"Yes, Pietro Molo; every one in Venice knows him. I marvel that you have not heard his name."

"Strange!" pursued the other half musingly. "Is he connected in any way with Jacopo Molo, the great banker o Milan?"

"They are brothers."

"Ah, I see. And the young man is the son of Jacopo I presume. Do you know his name?"

"Girolamo."

"Girolamo! Girolamo Molo! I had some knowledge of youth of that name in Damascus. He was connected with th Milanese family, too, if I remember aright. Why it must b the same, Giulio."

"Very possible, my dear Jacques. Pray what sort of person may he be? Is he a formidable rival, think you?"

"Well, that's not an easy question to answer. And ye there be those who would think he might find favour in th eyes of a fair lady, even of Venice. But corragio, dear Giulio you have been beforehand with him, and secured the lady' affections. But that unlucky contract that your father ha entered into gives him a terrible advantage, supposing that th money shall not be forthcoming."

"Ah, diavolo! Yes, Jacques, there is the difficulty, an in that you must help me."

"As how, Giulio?"

"You have often told me you are wealthy beyond yo utmost wants. I know you are generous, and I believe yo are my friend. Lend me then, dear Jacques, this sum, an my father and myself shall ensure thee the repayment of it b the pledge of all we possess in the world. I know well ho far he would go to avert the degradation of giving the child a Morosini to a wealthy plebeian."

"Of course he would. I can fully sympathise with h feelings in that respect. Well then, to save him and the and above all the fair Bianca, from such a calamity, I shall d my utmost. How much do you want?"

"Five thousand ducats."

"A large sum, by my faith; and upon such short notic Well, suppose I am unable to arrange the matter for thee t to-morrow, what then?"

"What then?" repeated Giulio fiercely; "why that I wi tear her from his arms, even though he and I perish!"

"Ah, Dieu!" cried Jacques, with a shudder, "ça sera grand dommage. Well, sooner than endanger thy life or th of Girolamo, whose plebeian puddle is not worth one drop thy aristocratic blood, I will give thee the sum thou r quirest. Fortunately I have letters of exchange upon th very Molo, nearly to that amount. Thy father can supp what I fall short, so far as a thousand ducats or so. Is not so?"

"Oh, yes!" said Giulio eagerly.

"Ah, then the matter is settled; thou shalt have the bi just now. Meantime, thou shalt pledge me in the health the fair Bianca, and success to thy undertaking. Nay, na dear friend, no more thanks, pray;" and he restrained t protestations of gratitude which Giulio was pouring forth in delirium of joy.

The young man continued to converse for some time, b Jacques soon perceived that his companion was too mu engrossed by his own affairs to be able to sustain the part a boon companion. Accordingly, he arose, and taking fr his portmanteau, which lay on a chair in the room, a sm casket bound with straps of gold, he unlocked it, and dr forth several papers. From these he selected several bills, letters of exchange, and placing them in the hands of Giul said,—

"Here, caro mio, are bills to the amount of four tho sand ducats. Your old friend Molo will scarce refuse honour them. We shall meet again soon in Venice, wh thou canst give me the security thou proposest. And n thou art anxious to depart, so I will not detain thee. Buo notte."

The friends embraced cordially, and in a few moments mo Giulio was crossing the lagunes in his gondola to Venice; t twilight had faded into darkness before he left Mestre, a long ere he reached the city the gloom of night had sett down upon it.

PHOTOGRAPHY AS A FINE ART.

At a time when a newly awakened feeling for art, and need for true art-culture, has sprung up amongst us, nothing could have been devised, or come more opportunely, as a means of imparting a sound education of the eye and of refining the taste of the lover of art, than photography; and the more so, since it is deficient in the very pictorial element so much coveted, namely—colour.

THE BOY IN THE ARCH.—FROM A PHOTOGRAPH BY P. DELAMOTTE.

Limited as the powers of photography are, at present, to the representation of form by the agency of light and shade only, photographic pictures possess a *severity of truth* which

renders them invaluable as a means of accustoming the eye to accuracy of outline and fidelity of light and shade. Colour cheats the eye to a great degree in its perception of form; therefore we hope that the so-much coveted discovery of the means of producing images in their natural colours, may be delayed until the more important result of training the eye to the appreciation of correct form has been accomplished.

The necessity for this education of the eye, both on the part of the artist and the public, must be evident to every one who can skilfully criticise the artistic productions which cover the walls of our exhibitions; it will be seen that amid the crowd of *painters* the good draughtsman is the exception rather than the rule. And this deficiency arises from the ordinary practice of young artists, who, in their eagerness to make pictures, rush to colour before they can produce a really finished drawing; hence it is that this country cannot show more than three or four eminent lithographers who can compete with the crowds of the same class of artists to be found in France and Germany. And thus the public, so seldom having an opportunity of seeing accurate drawing, accepts the bad with so much favour, because its falsehood is glossed over by meretricious colour: and further, it is incapable of detecting the gross distortions presented to view even in the pictures of many artists of note. A correct eye for the appreciation of form, as well as colour, is seldom found combined in the same individual; the former is capable of great improvement, while the latter, like an ear for music, cannot be acquired, although, when latent, it may be more or less correctly developed.

It will at once be evident that this art must come into antagonism with the pencil of the artist, and great has been the fear and consternation that the draughtsman's and painter's occupation was gone. It is said that photography is hated by artists, but if so, it can only be by those who are unworthy of their calling. An inferior mechanical artist may be jealous of such a rival, since it must compel him to be more faithful in his representations; but the artist with a true genius for his calling welcomes photography as a friend and ally. He will find scope enough beyond the limits of mechanical reproduction for the full play of his genius. Photography takes no liberties with nature, it never sacrifices truth to tricky effect. The light and shade in a photograph are not the less effective for being nature's own, and in nothing is this fact more evident or striking than in architectural views, when compared with an ordinary artist's sketch of the same structure. In the latter it is frequently difficult or impossible to make out the details of the ornamentation, in consequence of the conventional manner in which the artist delineates them; while, in the former, every variation of surface, the most delicate chiselling, and even the qualities of texture, are given with wonderful truth, which an examination by the microscope even confirms.

We are led to these remarks by an examination of the interesting collection of photographs now exhibiting at the Photographic Institution in New Bond-street. Here we have collected into a focus, as it were, the choicest productions of this wonderful art, contributed by practitioners of other countries besides our own, and which fully represent the great state of perfection at which photography has arrived. Every department of art and nature is laid under contribution, and each adequately represented. Nature, animate and inanimate (the animals "taken unawares"); the leafless tree with its perplexing anatomy of branches and twigs, or crowned with its luxuriant foliage; the corn-field, the rural lane, the copse and dell, the lofty battlemented castle or lowly cottage, the bridge, the stream, are mirrored before us with picturesque effect and microscopic fidelity. But the happiest sphere of its operations appears to us to be architecture. How striking the countless details of the Gothic cathedral, or the crumbling ruin, or distant city with its spires, turrets, and domes, or the nearer view with the portraiture of public buildings; some of these views present charming *pictures*, the effect of which it would be impossible for art to improve. One of these views, simple in its subject ("The Boy in the Arch," photographed by Mr. Delamotte), but most brilliant in effect, from its pleasing variety of light and shade, has so much merit that, by permission of the photographer, we have had it engraved for this Magazine, for which purpose it is extremely well suited; for while lacking those minute details which give so much value to certain representations, yet are so difficult to render by the artist's pencil, it has a sufficient breadth of *chiaro oscuro* to form a good picture. The boy, too, with his natural easy attitude, immediately attracts the eye, and imparts life to a scene which, without him, would lose much of its interest.

Among other architectural portraits in this exhibition, there are two, at least, which we cannot pass by without special mention: a view of "The Cathedral of Notre Dame," at Paris, and "The Hotel de Ville," in the same city. There are, doubtless, others of equal merit, but in them we recognise *all* the conditions we require to be fulfilled in admitting photographic pictures to the rank of works of art; for, be it observed, there are two classes of photographers, the *mechanical* and the *artistic:* and the same object taken by two individuals will be insipid or interesting according to the amount of artistic feeling employed in taking the view. Now we have seen many photographic views of the Notre Dame; but none that evinces so fine an artistic perception as the one under consideration, taken by M. Baldus, as is evidenced in his selection of the point of view, and the time at which the picture was taken. During almost every hour in the day the pictorial aspect of a building varies, owing to the state of the atmosphere, and to the play of the sun's rays upon its principal or lateral façades. The artistic photographer will select the hour for taking his view when the building is most picturesque; the mechanical photographer will take his view at any hour indifferently; but the resulting photograph will loudly proclaim by which of the two it was taken. It is just the same in the art of painting; the majority of pictures exhibit merely mechanical or technical skill; all the higher qualities demanded in a truly artistic production are to be found only in the works of the few; hence the majority of pictures pass through three periods or stages of existence—production, exhibition, oblivion; or, as has been quaintly remarked, through hell, purgatory, and paradise: the latter consisting in the happiness we feel in forgetting them as soon as seen; for it must not be overlooked, that some three thousand new pictures are annually exhibited in London; but of that number how few are remembered for even a year after they are first seen.

But to return to photography; beside its suitableness for representing objects of the kind already named, there are also its applications to the delineation of sculptured works and portraits from life, and a wide field of usefulness in its power of reproducing *fac simile* copies of rare etchings and engravings, drawings, manuscripts, &c. In portraiture it has many advantages over the daguerreotype, and has nearly superseded it. In the multiplication of *fac simile* copies of etchings, we have some very choice specimens, in a portfolio of examples obtained from Rembrandt's works: indeed, almost every day yields its surprise in new applications of this magical art.

Although photography dates its existence but fourteen years back, its progress has been wonderfully rapid, considering upon how delicate and refined a series of observations its development is based. Continental photographers were far outstripping those of the land of its birth: within a few months its progress has been incredibly rapid; and this progress dates from the abandonment of Mr. Talbot's patent rights. English photographers can now boldly challenge those of any nation.

The proceedings of the Photographic Society, which was established about two years ago, are calculated to have a most beneficial influence upon the progress of this rising branch of art. Its second exhibition was opened a short time since, and was honoured by a visit from her Majesty and Prince Albert, who are well known to be no mean proficients in photography, as in other elegant pursuits.

THE COVENANTERS.

In "Old Mortality" Scott has represented or *mis*-represented the Covenanters. In other productions of his fertile genius he has alluded to them, and given, here and there, a sketchy indication of those terrible covenanting days, and of those who had imbibed the spirit of the times. Wandering Willie tells us, in a weird and fearful fashion, of the persecutors in hell; and in the "Bride of Lammermoor" we are introduced to Mr. Bide-the-Bent, who had been "out in the persecution." But in "Old Mortality"—the Marmion of his novels—the subject is brought more fully and broadly before us.

The covenant which the sixth James signed, while he was yet a boy—a sauceless blockhead, as his tutor called him—included an abjuration of the Roman Catholic faith and an obligation to support the Protestant religion. Later in his life this same sagacious and pedantic king renewed the covenant at Edinburgh, giving thereby fresh impulse to the Presbyterian cause; but the old quarrel between the prince and the priests soon broke out again, and while matters were in the most unsatisfactory state imaginable, James quitted Scotland as England's king. The religion of Scotland had become the great question of the day. James attempted to reduce its institutions to uniformity with those of England, and the quarrel, bad enough before, now grew worse. Of all causes of quarrel under the sun none have been so prolific as religion. When James claimed the right to rule in matters ecclesiastical, and instituted penalties to compel obedience, every Scottish pulpit rang with invectives. When bishops came to rule the church, and had their way prepared by church officers, whom the sapient king called superintendents, the innovation was most loudly and positively denounced, and there were not wanting "Mucklewraths" to launch their thunders at the prelacy. "Dress them as bonnily as ye can," cried one, "bring them in as fairly as ye will, we see the horns of the mitre weel enough." All this squabbling rent unhappy Scotland till the wisest fool in Christendom slept his last sleep.

Scotland under Charles I. was even worse than Scotland under James VI. The devastation of the civil war was keenly felt there; the sword of persecution and the sword of rebellion were out of their scabbards. The Scots were not men to be trifled with. More than once they had lifted their swords against a crowned head. Like the Henrys of France, the Stuarts seemed a doomed family. James I. had been murdered in his bed-chamber; the nation had arrayed itself against James II.; the lifeless body of James III. had been left on the battle-field; the heart of James V. was broken; and Mary Stuart was imprisoned and deposed. What they had done before they could do again. But Charles pursued his own course of policy. The church quarrel was to be summarily ended; a liturgy—not that of the English prayer-book, but another—was to be read evermore. But at the first reading in St. Giles, Edinburgh, the wooden stool of Jenny Geddes hurled at the reader's head, betokened how the people liked it. The Edinburgh mob were fierce and cruel, and women in all directions headed risings against the liturgy, and in great crowds and with great enthusiasm the people met and signed the National Covenant. The parchment was spread on a flat tombstone in the Gray Friar's church. So many signed, that in many instances there was room only for initials, and these were here and there written in blood. This was in 1638.

The Covenanters were denounced and condemned, but they remonstrated and appealed; and then Charles and they marshalled their armies, and the fray began—a "bishop's war," they sometimes called it—a war of "liturgies and leaden bullets." The blue flag with its inscripton in gold, "For Christ's crown and Covenant," floated over many a bloody field. The religious question was soon merged in that of politics—politics as plainly so as reform in parliament or an extension of the suffrage. Men sometimes do strange things in the name of religion. After the beheading of the first Charles, his son found a refuge with the Scots. They proclaimed him king, and the merry monarch became a Covenanter. At Dumferling, he appended his signature to a new declaration, renouncing "popery and prelacy," and asserting that he had no other enemies than those of the Covenant. Then came the reverse of fortune. The Presbyterians of Scotland and the Puritans of England at warfare, moistened the earth with blood, and did it in the name of God: while the shout on the one side was "the Covenant! the Covenant!" Cromwell and his hosts replied, with deafening cries, "the Lord of Hosts! the Lord of Hosts!" The Scots were subdued, Charles had to seek a foreign home, and Cromwell declared in the spirit of the times—that it "was the great hand of the Lord, and worthy of the consideration of all those who take in their hands the instruments of a foolish shepherd, to wit, meddling with worldly politics and mixtures of earthly powers to set up that which they call the kingdom of Christ."

The restoration of Charles II. was the beginning of sorrow for Scotland. "The Covenant might now be said to have completed its history. Once towering triumphant over three conquered lands, it was about to go down in an ocean of blood; its name had become a jest, and its partizans were objects at once of bitterest scorn and anon of fiercest obloquy. Their evil day had fully come, and although better times were yet to arrive, the full power and glory of their banner was never to return.

That well-liked, honest, upright minister of Crail—though withal given rather to sermon stealing—was their first messenger to the court, and as a simple presbyterian parson he came, but as a mitred prelate returned—the Rev. James Sharp became bishop of St. Andrew's, and with high triumph rode into Edinburgh. The burning of the Covenant by the hands of the hangman followed; then the old covenanting ministers were turned adrift. The depth of winter saw them homeless; for their old attachments were strong, and they refused to acknowledge the authority of newly-invested prelates. Four hundred congregations were thus deprived, but the deprivation was supposed to be made up by new teachers sent expressly to fill up vacant places. Then came those days of empty kirks and crowded hill-sides; the days when the episcopal teachers had none to listen, and the old pastors, in the green meadows and by the side of the still waters, preached to eager multitudes. To preach without a licence was sedition; pains and penalties fell on those who absented themselves from the parish church, but the preachers still preached and the people still listened. Quietly at first they met, and in quietness separated; but the dragoons were soon called out to prevent the gatherings and compel obedience to the law. Heavy fines were exacted, severe punishments inflicted, fines to the amount of fifty thousand pounds were paid in Ayrshire, women were publicly whipped, boys were scourged and branded, and, by shiploads, Scottish slaves arrived at Barbadoes. To give a drink of water or a piece of bannock to an ejected minister was a capital offence.

Oppressed on every hand, the Scots turned on their oppressors. They met to hear the word of God, but had their swords by their sides in case of conflict. Encounters occurred. They fought, and fought boldly, singing old saintly psalms in the rugged metre of the Scottish psalter, and struggled like men who had ventured all and had no mercy to expect.

General Dalziel, fresh from butchering Turks and Tartars, who had learnt the art of war in Russia, was sent to hunt out contumacious Covenanters; and James Graham, of Claverhouse, came with his wild dragoons, and that brow-beating lawyer, the "bluidye Mackenzie."

The story of that dreadful persecution is too well known to need a recital here. John Brown the carrier, shot at his own door, in presence of his wife and little ones, by the hand of Claverhouse himself; the five wanderers, shot at Glencairn as they lay hid in a cavern; the countryman, shot because he

knew nothing; and another, hanged because he knew and would not tell where his father lie concealed;—these, and a hundred other cases still more dark and terrible, are familiar to us, and their harrowing details are not to be forgotten. The severity of the persecution drove the sufferers to hide themselves in dens and caves of the earth—haunted dens, by the report of the neighbourhood, and believed to be so by the Covenanters themselves. "A very romantic scene," says Sir Walter Scott, "of rocks, thickets, and cascades, called Creehope Linn, on the estate of Mr. Menteath, of Closeburn, is said to have been the retreat of some of these enthusiasts, who judged it safer to face the apparitions by which the place was thought to be haunted, than to expose themselves to the rage of their mortal enemies."

The persecution was not of short duration; it lasted eight-and-twenty years, mystically indicated—so said the Scottish seers—by the eight-and-twenty gaps, or broken pieces, in the sword of Captain Paton, a stern Cameronian, and a man of great personal prowess, who had sealed his attachment to the Covenant by his death.

An incident which occurred during the persecution is represented in our engraving. And the story is this. A highland laird, in the days when the Puritans ruled, had sought the hand of a lady of good birth, and whose father had great influence with the presbyterian party. They loved each other; they were of the same age, the same rank in life; everything tending to promise a happy future—everything but one—they differed in their faith. The young man was a good Catholic and a true loyalist; the girl a Presbyterian—her family of the strictest sort. The consent of the girl's father was refused; but love was stronger than aught else; the girl was secretly married to her lover, and a month passed away. When the secret was discovered, the rage of the old man was terrible; he said little, but he acted promptly. Ere four-and-twenty hours had elapsed, the young man was betrayed into the hands of the Puritans: he escaped, on the journey to London, and vowed revenge. The news came that his wife was dead—dead of a broken heart, and the oath of vengeance was renewed. Charles II. was restored; persecution began in Scotland; and among those who persecuted most bitterly was a pale-faced, noble-looking soldier—the widowed man who had sworn revenge. While staying with his troop at a Scottish hamlet, at the base of one of the loftiest hills of Scotland, a highland woman brought news of a covenanting gathering; she betrayed it all for a Scotch pound and a glass or two of whiskey. There was to be a gathering, and a young girl was to be married to her plighted one, in simple presbyterian fashion, and in the open air. The troop was soon in motion, the spot soon gained; they halted for a moment, and looked down through the brushwood at the gathering in the valley below. It was a calm, beautiful picture. The pastor grave and solemn as one of Israel's leaders; the happy look of the young man as he took the trembling hand of his betrothed, and the group gathered around; the old men and the little children—all seemed so calm and still, as if they felt the peace of God within their hearts as God's sunshine fell upon them. A moment, and the soldiers galloped forward—a shout from the hill—the discharge of a rifle—the shrieks of the women—the volley of fire-arms, and soldiers and Puritans were mixed up together. Most of the group had fled; those who remained were prisoners. Two were slain, and those two the newly-wedded pair; hand clasped in hand, they lay upon the grass—dead! And the end of the story is this:—that beautiful girl, whose eyes were closed in death, who had been hunted out of life by that vow of vengeance, was none other than the soldier's daughter—the child of his melancholy union, of whom, till that day, he had never heard. It is a melancholy episode in a terrible history, and gives to the wild beauty of the spot where it is said to have occurred an additional and pathetic interest.

A COVENANTERS' WEDDING.

THE FUNGUS TRIBE.

CHAPTER II.

In our last paper we observed that the treasures of food which it has pleased God to provide for us in the fungus tribe are, if not wholly disregarded, at least by no means duly appreciated by the English. There is, perhaps, no country richer than our own in the esculent species of fungi; they abound in our woods and pastures, they grow from the ground and under the ground; they spring abundantly out of the substance of dead trees, and are often found on waste lands and heaps of rubbish, from which no other edible produce can be procured; yet, though this is the case, and more than thirty species of esculent fungi are spontaneously brought forth in England, there are only three or four of these species that are eaten by its inhabitants; all the rest of this abundant supply being allowed to rot under the trees, or to become the prey of field-mice, toads, slugs, and other creatures, to which they afford many a delightful repast.

Throughout the continent of Europe, on the contrary, plants of this tribe are eagerly sought after by all classes of men, and form the chief, if not the sole, diet of thousands, who would otherwise be but scantily provided with aliment. But fungi are not only the tolerated food of the poorer classes, they are also most highly prized by the rich man and the epicure; and afford, when daintily cooked, many a delicate dish and many a highly flavoured sauce at the most elaborately served and highly expensive tables. In Germany and Italy, immense numbers of the various species of this tribe are sold in the markets, and produce an amount of income which would seem to us almost incredible. In Rome, so important are the fungi as an article of commerce, that there is a public officer appointed for the express purpose of testing the species exposed for sale, and superintending this branch of the revenue; for in that market a tax is laid on all

FIG. 1.—AGARICUS CAMPESTRIS (THE MEADOW MUSHROOM).

FIG. 2.—AGARICUS DELICIOSUS (ORANGE MILK AGARIC).

FIG. 3.—CANTHARELLUS CIBARIUS.

quantities of fungi presented for sale exceeding ten pounds in weight. All fungi brought into Rome are supervised by this officer, weighed, sealed up, and all destined for that day's consumption sent to a central depôt. If, among the contents of the baskets offered, any stale, maggot-eaten, or dangerous specimens are found, they are sent under escort, and thrown into the Tiber; and another very remarkable circumstance is the law, that if any specimen of the common mushroom *(Agaricus campestris)* is found, it also is to be *thrown into the river!* So says an unpublished letter of Professor Sanguinetti, "Ispettore dei Funghi," at Rome. It is certainly singular that the only fungus which is freely accepted in all English kitchens, and considered as the sole common kind that is honest and trustworthy, and possessed of no murderous properties, should be the one thus protested against, "whether in a state good or bad!" "For forty days during the autumn, and for about half that period every spring, large quantities of funguses, picked in the immediate vicinity of Rome, from Frascati Rocca di Papa, Albano, beyond Monte Mario, towards Ostia and the neighbourhood of the sites of Veii and Gabii," are brought to Rome. "The returns of taxed mushrooms alone," says Dr. Badham, "during the last ten years, give a yearly average of *between sixty and eighty thousand pounds weight;* and if we double this amount, which we may safely do in order to include such smaller untaxed supplies as are disposed of in bribes, fees, and presents, and reckon the whole at the rate of six baiocchi, or threepence a pound (a fair average), this will make the commercial value of fresh funguses very apparent, showing it here to be little less than £2,000 a year." Besides this, we must consider the dried, pickled, and preserved supplies, which sell at a much higher price than the fresh, from one shilling to one shilling and threepence per pound, and also recollect that this calculation includes only the Roman market, and that every other market-place in the Italian states has its proportionate sale of this wide-spreading branch of the vegetable produce of the land.

With the above statements fully in our mind, and after having been habitually in communication with many of the families from amongst our peasantry who were but scantily provided with daily food, we found ourselves one day, during the last autumn, in an extensive pine-wood near Budleigh Salterston, in South Devon, and saw the ground, which was densely carpeted with the accumulated dead leaves that had fallen from the trees, and lain undisturbed for many years, studded in every direction with fungi, of every colour and of every shape, in such quantities as that cart-loads might have been gathered there. Huge purple, white, brown, and tawny *Agarics* were there; the deep orange of the *Boletus edulis* was interspersed with the snowy balls of the *Lycoperdons*, and the delicate apricot tint of the pretty and singular *Cantharellus cibarius*, with many other beautiful and edible species, were scattered in profusion around me. How could we, under these circumstances, do otherwise than regret that ignorance of the differences of species, combined with the strong prejudice which prevails in England against using any of this tribe (save the two or three favoured individuals), should shut out our poor from the possibility of availing themselves of this rich supply of wholesome aliment, which the bounty of God had provided for them, if they would but be persuaded to use it? It is true, that amongst this extensive collection of fungi there were some species which would have proved poisonous, and others which would have been but disagreeable food; yet the greater number of them were such as, if properly cooked, would have furnished, not only *wholesome*, but also savoury and pleasant food; and it seemed to us a great pity that they should be so wholly neglected, and left for a prey to reptiles and field-mice.

The chemical structure of fungi is said to be the most highly animalised, or, in other words, to partake more of the nature of animal composition than that of any other vegetable. Besides the intimations of this circumstance that are afforded by the smell of some of the species in decay, which partakes much of the character of that of putrid meat, and the strong meat-like flavour which some of them possess when cooked, we find the following fact stated—that, "like animals, they absorb a large quantity of oxygen, and disengage in return from their surface a large quantity of carbonic acid; all, however, do not exhale carbonic acid, but in lieu of it some give out hydrogen, and others azotic gas. They yield, moreover, to chemical analysis the several components of which animal structures are made up; many of them, in addition to sugar, gum, resin, a peculiar acid called fungic acid, and a variety of salts, furnish considerable quantities of *albumen*, *adipocine*, and *osmazome*, which last is that principle that gives its peculiar flavour to meat gravy."

Fungi are considered to be highly nutritious, and are said by many of the faculty to be easy of digestion. This latter opinion, though strongly supported by many foreign medical men, is certainly quite in opposition to the generally received opinion on that subject in England, and also to the ideas of ancient writers. Gerard, the quaint old herbalist, says: "Some mushroomes grow forth of the earth: others upon the bodies of old trees, which differ altogether in kinds. Many wantons that dwell near the sea, and have fish at will, are verie desirous, for change of diet, to feed upon the birds of the mountaines; and such as dwell upon the hill or champion grounds do long after sea fish; many that have plentie of both do hunger after the earthie excrescences called mushroomes; whereof some are very venomous and full of poison, others not so noisome, *and neither of them very wholesome meat.*" And again—"Galen affirms that they are all very cold and moist, and therefore do approach unto a venomous and murthering facultie, and ingender a clammy, pituitous, and cold nutriment if they be eaten. To conclude, few of them are good to be eaten, and most of them do suffocate and strangle the eater. Therefore I give my advice to those that love such strange and new-fangled meates, to beware of licking honey among thornes, lest the sweetnesse of the one do not countervaile the sharpnesse and pricking of the other."

Fungi are classed under two primary divisions—*Hymenomycetes* and *Gasteromycetes;* the seed lying externally in the former, and internally in the latter. These divisions are subdivided into four tribes—1st, *Pileati;* 2nd, *Clavati;* 3rd, *Mitrati*, and 4th, *Cupulati*. In each of these tribes we find esculent species, although most of that description are found in the first tribe, the *Pileati*, and of that tribe the genus *Agaricus* supplies the largest number of any of the genera.

All Agarics are furnished with a fleshy pileus or cap, a stipes or stem, and gills placed at right angles with their stem. The species of this genus differ widely in size, shape, and colour; but all agree in the possession of the parts which we have named.

Our own favourite meadow-mushroom (fig. 1) is the first we will describe, of which old Gerard says:—

> "The meadowe mushroom is in kinde the best;
> It is ill trusting any of the rest."

Every one considers himself a complete judge of this species, and few hesitate to present at their tables a dish of these agreeable fungi, without taking any other means of proving their trustworthiness, than that most fallacious mode of directing their cook to stir them whilst dressing *with a silver spoon;* in full belief that if their juices do not tarnish the silver, there can be no injurious specimen amongst them.

But although this kind is in such general use in England, yet it is by no means more easy to discriminate *it* from other species, than it is to discriminate most other kinds. "No fungus," says Dr. Badham, "presents itself under such a variety of forms or such singular diversities of aspect. The inference is plain; less discrimination than that employed to distinguish this, would enable any who should take the trouble to recognise at a glance many of those esculent species which every spring and autumn fill our plantations and pastures with plenteousness." The cap of this mushroom is in some individuals snowy white and smooth; in others, brown and scaly; in some instances the gills are of a delicate pink; in others of a deep, rusty black; some grow broad and flat; others in the form of buttons, looking almost like a puff-ball

of a soft, smooth texture, and of a pure white colour. The stem in some varieties is nearly straight, as in the larger one in our cut; in others it is broader, by one-third, at the top than at the bottom, and altogether shorter than it is wide, the under part of the cap being upturned at an obtuse angle with the bulky stem so as to display the coarse-looking, dark gills which line it.

It is a pleasant thing to sally forth early in the day, under the first burst of sunshine which breaks out on a soft, clear morning in September; and to see how the night dews have been at work in hastening the growth of fungi. We need hardly say that mushrooms are excellent pickled. The way to do this is to select all the *buttons;* place them skins and all in a stewpan with allspice, salt, and pepper; stew them until they have given out every drop of their juice, and (like children who give and then repent, and take back again) have re-absorbed all those juices charged with the flavour of the spices, amongst which they have been straying. When this process is completed, add as much hot vinegar as will cover your mushrooms, boil them just for a minute, and they are finished. The large broad specimens are delicious, broiled with salt and pepper; and the middle-sized kinds, stewed in their own juice, with a little pepper, salt, and butter. Whatever the Italians may say, the *Agaricus campestris* is a delicious article of food; and it is a very rare thing for any injurious effect to arise from partaking of them.

Agaricus deliciosus (fig. 2), the "Orange milk Agaric," is another which is in high repute; it may be found in the fir plantations of Scotland, as also on those of the barren hills at Barr in Staffordshire, as well as near Guildford in Surrey, and in some other places. This fungus is of a dull reddish orange, with a somewhat viscid cap, frequently lined with concentric circles of rather a brighter hue. It has narrow branched gills approaching flame colour; the stem is orange, solid, and tapering downwards, slightly bent, from two to three inches high, and covered at the base with short pointed hairs; the flesh of the cap, or pileus, is firm, and filled with red orange milk, which turns green when exposed to the air, as does the whole plant when bruised. Badham and Loudon agree in stating it to be very excellent food, and much in request in the Italian markets. Sowerby says, "It was very luscious eating, full of rich gravy, with a little the flavour of muscles;" and Sir James Smith, "that it really deserves its name, 'A. deliciosus,' being the most delicious mushroom known." Badham says, "it may be served with white sauce, or fried; but the best way to cook them, after duly seasoning with salt and pepper, and putting a piece of butter upon each, is to bake them (in a closely-covered pie-dish) for about three-quarters of an hour."

Another of the *Pileati* which we must notice is the *Cantharellus cibarius* (fig. 3), an exceedingly pretty fungus, of a soft apricot hue throughout both cap and stem; and instead of gills, it is furnished with thick veins or plaits, very elegant in appearance. It is irregular in form, and the stems are seldom, if ever, in the centre of the cap. Loudon says that the best way of preserving them for use is to string them in rows after they have become flaccid, and hang them in a dry place, where they can have plenty of air; they then form a delicious ingredient in rich gravies. Vittadini, an Italian writer on the subject, says that the common people in Italy dry, or pickle them, or keep them in oil for winter use, and recommends, as they are rather tough, to soak them for a night in milk, when they should be gently stewed either with other fungi or with meat, or else alone.

SCULPTURES IN THE CRYSTAL PALACE.

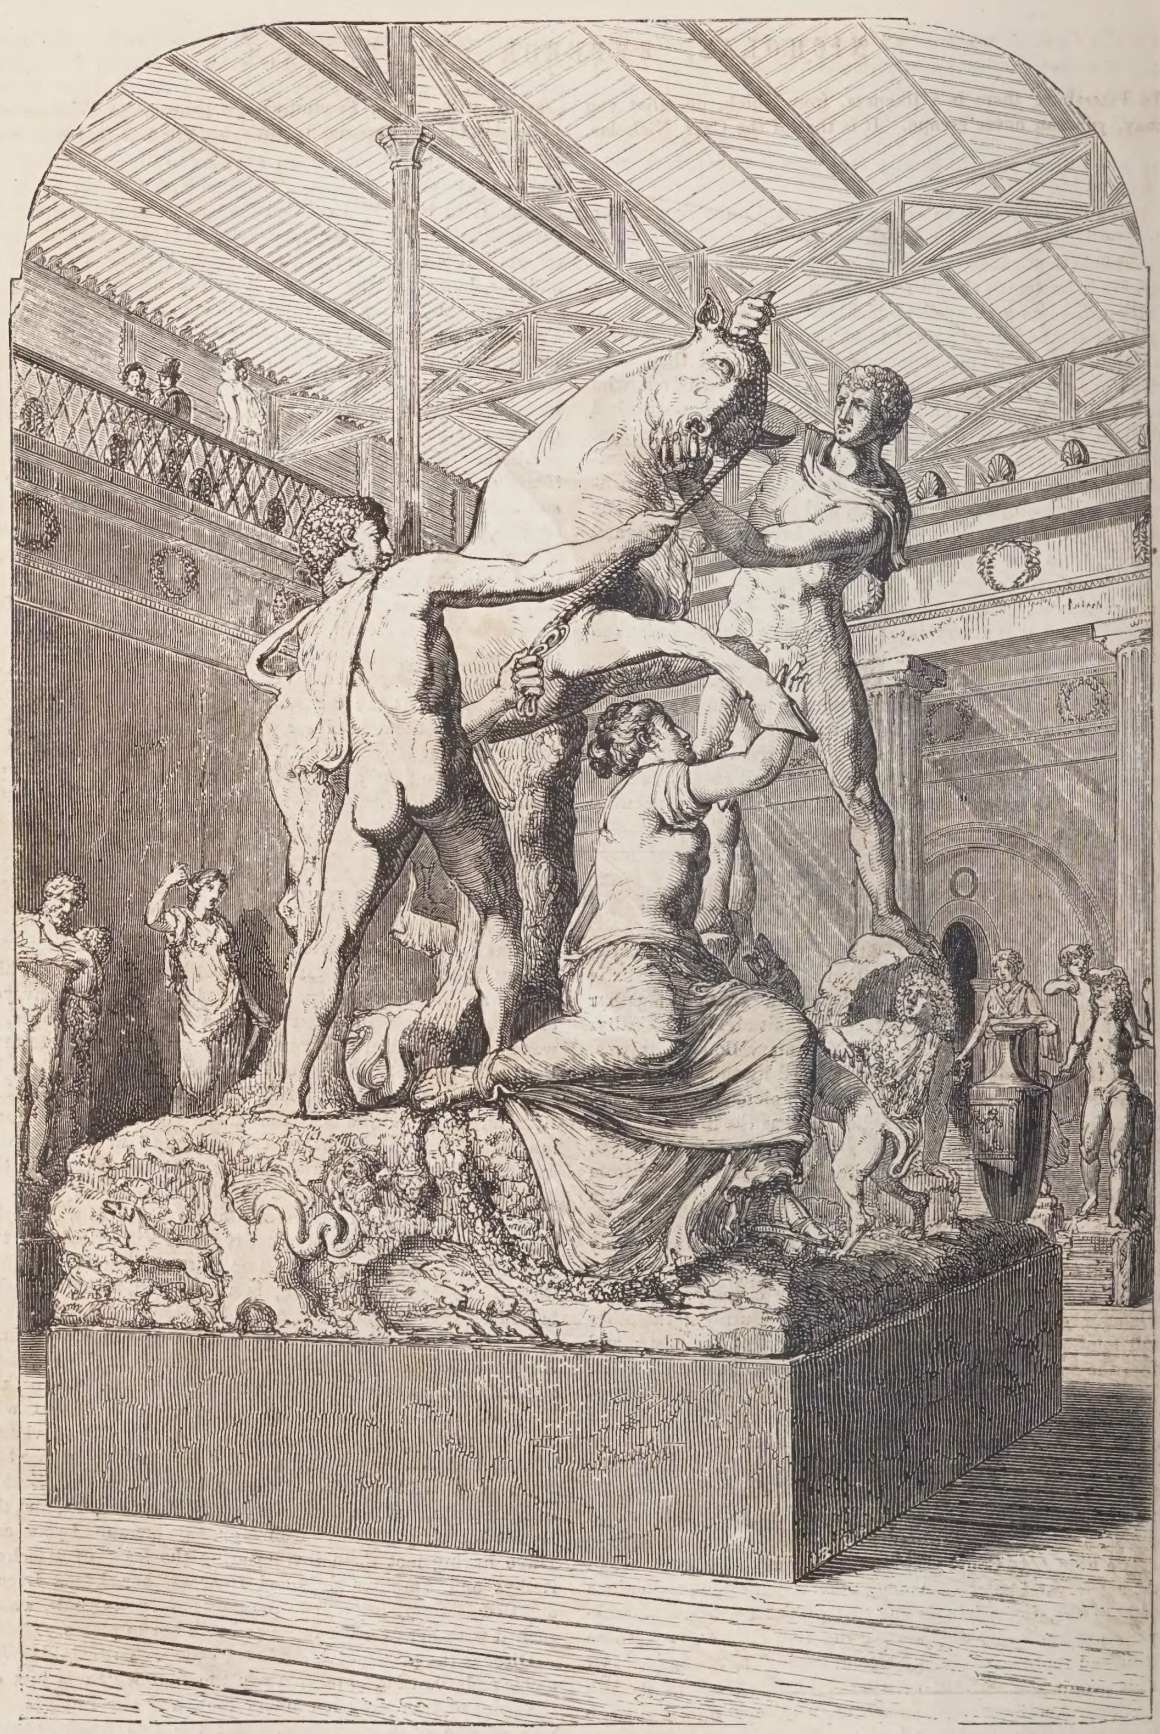
One of the greatest wonders of the Great Exhibition was the building in which the vast collection of industrial and artistic productions was enshrined. It was a thing altogether unprecedented, combining lightness, magnitude, and stability, in a degree never before known. Yet, marvellous as it was, it seems likely to be completely eclipsed by the splendour of the magnificent structure now nearly completed at Sydenham. Indeed, we may venture to predict that, as the first temple at Jerusalem was surpassed by the greater glory of the second, so the building in Hyde-park will be all but banished from recollection by the superior grandeur of the Sydenham palace, or if remembered at all, it will be chiefly as the parent of the present edifice. The former building was merely intended to answer a temporary purpose; the present is to be one of the established institutions of the country. The one was mainly devoted to purposes of practical utility; the other will minister as much to the gratification of the taste, and even the amusement of visitors, as to their solid improvement. Hence more attention has been paid to the general beauty of the edifice; its interior will be decorated in a higher style; its contents will be more varied, and its conveniences more multiplied, so as to make it an agreeable resort at all seasons and in all weathers. To these numerous attractions must be added the picturesque scenery and beautifully laid out gardens and grounds by which it is surrounded.

The Fine Arts Court will form a very interesting feature in the new crystal palace. Among other remarkable productions of high art, it contains a fine cast of the celebrated marble sculpture known by the name of the *Toro Farnese*, or Farnese Bull, and represented in the accompanying engraving (p. 344). This group was cut out of a solid block of marble by two brothers, Apollonius and Tauriscus, who came from Tralles, a town in Cilicia, Caria, or Lydia. According to Pliny, there was in his time an inscription on the marble, in which the two artists made mention of Artemidorus, their father, and Menecrates, their master.

Under the reign of Augustus this group was at Rhodes. Asinius Pollio, a rich patrician, and a great patron of literature and art, whose favour towards the poet Virgil has secured him an honourable immortality, purchased it and had it conveyed to Rome. Buried in obscurity for a long series of ages, it was discovered about the year 1547, during the pontificate of Paul III., in the hot baths of Caracalla. It was found to be in a mutilated condition. A Milanese artist named Baptiste Bianchi, or Biondi, was commissioned to restore it. For a long time it formed part of the collection in the Farnese Palace at Rome, whence arose the name it now bears. In the last century it was conveyed to Naples, and employed to decorate the beautiful garden of Chiaja, which is washed by the sea, and forms part of what is called Villa-Reale, or the Royal Villa. At the present time it stands on the ground-floor of the Bourbon Museum, in a large hall, facing the celebrated Farnese Hercules, executed by Glycon of Athens.

It is well known that this gigantic composition represents Amphion and Zethys preparing the punishment of Dirce, their step-mother, in revenge for their mother Antiope. Lycus, the King of Thebes, says the legend, had divorced his wife Antiope to marry Dirce. The new spouse, impelled by violent hatred, had Antiope, whom she had supplanted, exposed to the fury of wild beasts, together with her two sons, Zethys and Amphion. But a shepherd rescued the two sons, and the mother herself joined them on Mount Cithæron. Lycus and Dirce having met them there during the feast of Bacchus, Zethys and Amphion defended their mother, killed Lycus, and tied Dirce by her hair to the horns of a young bull, which rushed with her over the rocks and tore her to pieces.

Dirce is the principal figure in the group. Turned sideways, she is endeavouring to push away the bull which is just on the point of trampling her under foot, and she implores the pity of one of her enemies. But the two brothers have already fastened to the horns of the furious animal the cord which is intertwined at its other extremity with the hair of the ill-fated woman. Antiope stands in the background observing the preparations for vengeance without emotion. The festoons



CAST OF THE "TORO FARNESE" IN THE CRYSTAL PALACE AT SYDENHAM.

and various ornaments at the feet of Dirce are connected with the feast of Bacchus. A dog is jumping up and barking at the bull, and a young priestess of Bacchus, who is sitting near, seems terrified at the horrible scene before her.

NICHOLAS, EMPEROR OF RUSSIA.

In Petersburg there is a likeness, from which, do what you may, you can never escape. It is that of the Czar, Nicholas,

NICHOLAS, EMPEROR OF RUSSIA.

Emperor of all the Russias, whose iron rule extends over seventy millions of souls, and one-seventh of the earth. Nicholas Pawlowitsch is the ninth of ten children borne to Paul by his second wife, Maria Feodorowna, a princess of Würtemberg. The day of the imperial infant's birth was the 7th of July, 1796. The child had reached the age of four months, when on the death of his grandmother, Catharine II., his father ascended the throne. The eyes of Russia were fixed on

Alexander and Constantine, his elder brothers, and no reason whatever had Maria Feodorowna to suppose that the young Nicholas would ever wear the imperial crown. His youth presented no remarkable feature; yet, probably, may his earliest recollections have some fibres of connexion with that terrible night when assassination passed through the chambers of the old palace of Michailow. It is not improbable that the earliest thought of his own conscious life, was that moment when his imperial mother, alarmed at the clatter of arms and the confusion of tongues that filled the castle, snatched from their beds the two youngest princes, Nicholas and Michael, to hasten with them through the long succession of apartments to the emperor's suite of rooms, when she was encountered by Count Pahlen, who, by nature cold as ice, partly by persuasion, partly by force, led her back to her own chamber, the door of which he carefully closed, saying, "Madam, be quiet, there is no danger for you." At the same instant he vanished, leaving unanswered the anxious question of the empress, "But my husband?" The deed was done, and Alexander, her son, was the reigning czar.

The education of Nicholas would have been very superior had he profited by the high talents and culture which were called on to conduct it. But the young man showed more inclination for soldiering and making sport of the courtiers than for serious, certainly for deep and difficult study. Modern languages, however, he acquired with ease, and manifested a taste for music, especially that of a martial kind. Cold and close by nature, Nicholas regarded his instructors with unconcern, and treated them with distance. Even toward his mother he appears to have shown no tenderness when once he was fairly out of the nursery. Of his youthful friendships not a word is said; already the prince overshadowed the youth. Gifted only with a common-place soul, he could not even in his favourite military recreations and pursuits rise to anything great or noble, but was satisfied with becoming a connoisseur in belts, and locks, and flints, and cartridge-boxes, and ramrods, and parade evolutions. His severe nature never unbent in the company of the officers, and towards officers and men he maintained a rigid discipline. Yet was he often unjust in his punishments, consulting rather his passions and his prejudices than the simple facts of the case; and when once he had done a wrong, he was never known to make amends, or in any way to rectify his error, though after he became emperor he has not seldom repaired an injustice into which he had fallen; still those acts of justice seem to have been the result rather of prudence and policy than of a high and generous regard for what is right.

The prince naturally failed to excite on his own behalf any warm sympathies in the public mind. Those who know him best ascribe to him only moderate abilities, shrug their shoulders when they speak of his want of information, and consider him as essentially a mere imitator of his predecessor Alexander, only that he wants the affability of the latter, and inwardly regards with dislike the huzzas of his almost idolatrous populace. However, it must be added that the coldness and hardness of his nature had one advantage, namely, that they guarded him against the fascinations and immoralities of a corrupt city and court.

The year 1814, together with the peace of Europe, brought back the former splendour of the palace life of Petersburg. It also showed the necessity for extraordinary attention to the inner condition of the empire, which during the war had fallen into lamentable neglect. The emperor, now advanced in years, had no heir. His eyes fell on Nicholas, and it became important that the grand prince's education should be improved. Foreign travel was determined on. Characteristic was the avowed object of that tour, which was nothing else than a visit to the battle-fields of the war against Napoleon Bonaparte. In addition to a survey of the chief of them in both Germany and France, he visited different courts, amongst others that of England. Returning home he made a hasty tour of the chief cities of Russia. Reviews and field-days marked his passage. In his judgment no place after a field of battle surpassed a parade in interest. The soul of Nicholas is the soul of a soldier. Shortly after his return, and on the 13th of July, 1817, he, now scarcely one-and-twenty, espoused in Petersburg, Marie Charlotte, princess of Prussia, who was about two years younger than himself. Years passed on in the midst of social disturbances and movements, which, though for the most part beyond his own dominions, Alexander did his utmost to compose and terminate. The chief result was, that he gave himself infinite pains. At last, longing for a quiet which he could not have, and after bereavements, disappointments, vexations, and sufferings, which excite anything rather than a desire for an imperial life, the reigning czar came to his end on the 1st of December, 1825.

When the will of Alexander came to be opened it was found that he had appointed to succeed him, not Constantine his elder brother, but Nicholas the younger. Nevertheless, for three weeks the latter was not emperor, but every public act was done and announced in the name of Constantine. This uncertainty, anywhere a serious evil, was full of danger at St. Petersburg, where the maintenance in its fullest force of the maxim, "The king never dies," was of essential consequence to the maintenance of the absolute government. At length difficulties were overcome, and on the 24th of December, Nicholas formally assumed the vacant throne. It is a curious fact, that the prince, who is now regarded as *par excellence* the representative and support of legitimacy, should owe his crown to a violation of the highest law of descent. The administration did not settle in the hands of the new czar without a conspiracy, which, however, was not allowed time to spread, and which was crushed together with its authors by the heavy hand of despotic power. The event was worse than a bad augury, for it confirmed the emperor in that course of unqualified absolutism which he has pursued every year with augmented rigours. To a man of his contracted faculties and inconsiderable reading, the progress of liberal ideas and institutions in the western and southern parts of Europe, serves only as an ever-increasing additional reason for tightening the reins of government at home, and for exercising all possible restraint abroad. And thus has it come to pass that the aggressive and despotical character of the emperor's foreign policy has for its source and support two of the strongest grounds: first, the traditions of his family; and, secondly, the necessities of his age; both of course understood in his own sense. Conquest and repression, thus recommended as the aim of a reign, easily fall into accord. In the mind of Nicholas they are practically one, and thus united, they act on his stern soul with ceaseless influence and overpowering effect. The momentum, which hence ensues, has another source of power. The Emperor of Russia is the head of the church. As head of the church he is regarded by his ignorant boors as next to God himself. Objects very near each other are often confounded. And so it is that Nicholas is accounted a god on earth, a *presens Divus*, even more so than any Roman emperor of old. His word in consequence is not only law, but the most sacred law; his will is not only absolute but righteous, and his wishes are all-prevailing, and his acts unimpeachable.

We have already seen that the czar is a soldier, a soldier of small dimensions, but "every inch" a soldier. This soldiership, which before his time had struck its roots deep in the country, Nicholas has been nationalised. Russia is a huge camp, and the court is its head-quarters. Social life is a piece of drilled mechanism, passively obedient to the moving power and going on with exactitude and constancy till the pressure is removed. Hence at once the strength and the weakness of the czar's empire;—its strength, for the whole moves as one mass; the weakness, for that mass is inert, passive, it has little life and no spontaneity. And hence its head is both to be feared and to be disregarded—to be feared, for he can ravage a neighbour's territories and put down liberty near his own borders, but he has no power for distant action; by diplomatic arts he may make himself felt in every European court, but he is unable to support his intrigues by armaments and expeditions, sundered from his soil, and sent to remote countries.

TIGER HUNTING.

Hunting is one of the strongest passions of man. This is easily explained. In the early stages of the history of the world, the human race had little to depend on for food, save the produce of their skill and ingenuity in the chase. It is probable that the inventive genius, which enabled man to provide arms and weapons for this purpose, drew his first attention to the horrid thought of war, by which, probably, on a small scale, he was able to provide himself with victuals by pilfering the successful hunter. Those must have been strange times, when man in his primeval simplicity, with untutored mind, and the most inartificial weapon, wandered through the vast plains of the early world, hid himself in the forest or the brake, concealed himself in trees and waylaid the new and strange beasts that came in his way, and having satisfied hunger, and drunk from the clear stream, laid himself down to sleep beneath the shade of some rude bower, fashioned by the ingenuity of his equally wild and primitive mate.

In those days, the wild beasts—the lion, the tiger, the panther, and the bear—were the terror of the human race, as they remained until men began to overcome them by ingenuity and the sheer strength of numbers. A hundred arrows and a hundred lances did that which a single bow and spear could not have done, until the day and hour came when the strange invention of gunpowder placed us on a level, or even above the brute creation, in single-handed contests.

But even now, with the rifle and the fowling-piece, there are animals whom it is dangerous to encounter, though under every advantage of time and place, and against whom it is needful to employ all that activity and ingenuity which characterise the great fictitious creation of the American novelist, honest Hawkeye, and the real and extraordinary Gerard, Cumming, and Sir W. C. Harris, whose lion hunts are so wondrous, that we should hesitate to credit them did we not personally know the veracity of Gerard, and lament the high soul and honourable character of our departed friend Harris, whose travels in Shoa, and whose wild sports in Africa, will not easily be forgotten.

The tiger is even more dangerous than the lion, from the simple fact of its stealthy and crawling character. It roars not like the king of beasts, and creeps about, seeking whom it may devour, with a cautious step, which scarcely any other animal possesses, save and except, perhaps, the panthers and bears that frequent Dismal Swamp, and that creep round the bayous of the Mississippi.

In the early history of India, we find that the ravages of lions and tigers were carried to such a frightful extent, that whole hamlets of the weak and pusillanimous natives were destroyed by them; and that whenever an attempt was made to face them, it was by regular armies congregated for that purpose. Even these collected forces were often routed by the wild animals of the woods. But, subsequently, British officers found their way into these savage fastnesses, with their cool courage and their superior fire-arms; and yet even they had to record fearful stories of the furious beasts, and had to tell the tale of the death of many a brave comrade in the strange and novel contest. The tiger had not yet learned to dread the crack of the rifle, nor before severe lessons to become more cautious and circumspect. In the time of Le Vaillant, lions would enter an encampment and coolly carry off the fattest sleeper, generally some unfortunate Hottentot woman.

Even when elephants were used in the tiger hunt, it was difficult to find animals of that species ready to charge the jungle when the trail of the tiger left a marked scent; or when such animals were known, they commanded a very high price. But now there has come a great change in the disposition of the wild beasts of the Indian and African wilderness, and the tiger commits its depredations only where the persevering and indomitable valour of the English sportsman is unknown, or where his rifle with its heavy and deadly ball is new. The meekest and mildest of the servants of the East India Company will now sally forth on their elephants, seated in their howdah, with their guide, to hunt the tiger to its very lair; this animal now having to be driven forth often from jungle and cave by the rocket and other projectiles.

We have already in a previous article (p. 327) made some allusion to the subject in hand, but it is a matter of inexhaustible interest, and a volume might easily be written on the hunts which have been undertaken against this ferocious beast of prey.

A letter to Sir William Jones, dated Chinsura, describes a very animated hunt. On the eve of the chase, all the necessary tents to form a camp were sent to within a mile and a half of the jungle, a district covered by thick reeds about fifteen feet high. Early in the morning thirty elephants were sent forward, and at two the hunters started, and having reached the rendezvous, mounted their elephants and entered the jungle. At daybreak they had formed an extensive line, and had penetrated in a detached jungle. They found in the tiger's lair, half an ox, two human skulls, and a pile of bones; some whitened by long exposure, others still red with blood. But the animal had departed.

Leaving this scene of carnage, the hunters advanced, and soon heard the cry of *bang*, which is the local name for the tiger. They accordingly again formed their line and entered the great jungle. Scarcely had they done so, when five royal tigers, of the largest size, darted forward from the same spot and dispersed, flying, however, but slowly, and soon halting. The line of hunters was in the form of a crescent, which embraced both ends of the jungle; in the centre were elephants, on which were men armed with guns. One approached the retreat of the first tiger: he moved not until the riflemen were near, then he roared like thunder and bounded towards them. The elephants turned and fled, but after rushing along about fifty yards, they stopped, and once more faced the jungle. The tiger made a second rush, bounded on an elephant mounted by three Indians, and struck one off. The tiger, however, perceiving the strength of his enemies, sheered off to his lair, where he was shot. Three others were killed, but the fifth, a cunning old tiger, escaped. The attack on the fourth lasted a long time, as the animal defended itself with great courage, and was only killed by a general discharge.

In a curious book called "Cynegetica," * there is a division headed "Asoph Ul Doulah's Hunting Excursions;" and from this, as not being a book to which every one can refer, we make some extracts. He says: "The vizier always sets out upon his annual hunting party as soon as the cold season is well set in, taking with him his household, his zenana, his court, and a great part of the inhabitants of his capital.† He takes with him five hundred elephants, &c. &c. . . . When intelligence is brought of a tiger it is matter of great joy, as that is considered as the principal sport, and all the rest only occasional to fill up the time. Preparations are instantly made for pursuing him, which is done by assembling all the elephants, with as many people as can conveniently go upon their backs, and leaving all the rest behind, whether on foot or on horseback. The elephants are then formed in a line, and proceed forward regularly, the nabob and all his attendants having their fire-arms ready. The cover in which the tiger is most frequently found is long grass, or reeds so high as often to reach above the elephants; and it is very difficult to find him in such a place, as he either endeavours to steal off, or lies so close that he cannot be roused till the elephants are almost upon him. He then roars and skulks away, but is shot at as soon as he can be seen; and it is generally contrived, in compliment to the nabob, that he shall have the first shot at him. If he is not disabled, he continues skulking away, the line of elephants following him, and the nabob and others shooting at him, as often as he can be seen, till he falls. Sometimes, when he can be traced to a particular

* "Blane's Cynegetica." London, John Stockdale, 1788.

† He was vizier of the Mogul Empire, and Nabob of Oude.

spot where he couches, the elephants are formed into a circle round him, and in that case, when he is roused, he generally attacks the elephant that is nearest to him, by springing upon him with a dreadful roar, and biting at or tearing him with his claws; but in this case, from his being obliged to show himself, he is soon despatched by the number of shots aimed at him; for the greatest difficulty is to rouse him, and get a fair view of him. The elephants all this time are dreadfully frightened, shrieking and roaring in a manner particularly expressive of their fear; and this they begin as soon as they smell

But there is as much difference between the chase of the tiger by British sportsmen and those of the nabob, as between the hunters of the early ages and those of a few generations back. The time is changed, indeed, from the hour

> "When Nimrod bold,
> That mighty hunter, first made war on beasts,
> And stained the woodland green with purple dye,
> New and unpolished was the huntsman's art;
> No stated rule, his wanton will his guide.
> With clubs and stones, rude implements of war,

A TIGER HUNT.

him, or hear him growl, and generally endeavour to turn back from the place where the tiger is; some of them, however, but very few, are bold enough to be driven up to attack him, which they do by curling the trunk close up under the mouth, and then charging the tiger with their tusks; or they endeavour to press him to death by falling on him with their knees, or treading him under their feet. If one tiger is killed in a day, it is considered as a good day's sport; but sometimes two or three are killed in one day, and even more, if they meet with a female and cubs."

> He armed his savage bands, a multitude
> Untrained; of twining osiers formed, they pitch
> Their artless toils, then range the desert hills,
> And scour the plains below."

The same poet has given a picturesque description of the scene sketched by Blane:—

> "Incessant shouts
> Re-echo through the woods, and kindling fires
> Gleam from the mountain tops; the forest seems
> One mingling blaze: like flocks of sheep they fly

Before the flaming brand: fierce lions, pards,
Boars, tigers, bears, and wolves; a dreadful crew
Of grim, bloodthirsty foes; growling, along
They stalk indignant; but fierce vengeance still
Hangs pealing in their rear."

Bishop Heber,* in his valuable work on India, has given much information on the tiger and tiger hunting, and specially mentions a very curious circumstance. "In passing through the city, I saw two very fine hunting tigers in silver chains." This contradicts the general idea that nothing can be done with this animal. He relates, also, an anecdote which shows the power of the beast. A Bheel was guiding some soldiers. "The officer followed at the head of his men, and had moved slowly half asleep on his saddle for about five miles, when he heard a hideous roar, and saw a very large tiger spring past him so close that he almost brushed his horse. The poor Bheel lifted up his sword and shield, but was down in an instant under the animal's paws, who turned round with him in his mouth, growling like a cat over a mouse, and looked the officer in the face. He did what could be done, and with his men attacked the tiger, whom they wounded so severely that he dropped his prey. But the first blow had done its work effectually, and the poor man's skull was mashed in such a manner as literally to be all in pieces."

The people of Rohilcund go out to fight the tiger with matchlocks, swords, and shields, and generally succeed in killing him, with, however, the loss of one or two lives. The heroic peasants combat hand to hand, as the scimitar-cuts on the hide have often afterwards proved. But now the English officers in India do all this work for the natives.

* "Narrative of a Journey from Calcutta to Bombay, &c."—London: Murray, 1844.

THE VILLAGE OF DENIS, ON THE RIVER GABON.

THE VILLAGE OF DENIS, ON THE GABON.

The Gabon, which forms a receptacle for a number of water-courses that have their source in the interior of the continent of Africa, is situated between 10′ and 30′ north latitude.

It may be considered to be bounded on the right shore by the points Clara and Obendo, upon the left by Pongara and Bohuin, and upon the side farthest from the sea by the islands of Konikey and Perroquets, beyond which extends the river Gabon, which, though of a considerable width near its mouth, narrows rapidly until its breadth is less than a mile. Before the establishment of French settlements upon the coast, Gabon was an important seat of the slave-trade. The wars which the different races inhabiting its banks and the neighbouring regions carried on among themselves, and their distant excursions, continually furnished the slave-ships with a considerable number of captives. The principal agents in the odious trade were the M'Pongos, whose most important village, situated upon the left bank, is called Denis, in honour of the chief who governs it. The M'Pongos are still almost the only agents of the barter which is carried on in the neighbourhood of the Gabon, and, in order to preserve this monopoly, they take care to maintain a mutual distrust between the Europeans and the tribes of the interior. On the one hand, they represent the Boulous, Pahouins, Bakalais, M'Bichos, &c., to us as nations of cannibals, who are constantly prowling about their villages to make captures, in order that they may have a feast on human flesh; and they feign the greatest terror at the mere name of their near neighbours the Boulous. On the other hand, they impress these tribes with the idea that we are

rapacious and cruel pirates, when they visit them to procure from them commodities which they afterwards bring to us, such as ivory, wax, and dye-woods. But, in spite of this, the minds of the people of the interior are becoming enlightened as to the truth, and it is probable that, by means of some expeditions despatched to a considerable distance up the principal branch of the river, this trade, which is daily increasing, will soon become direct. Then, perhaps, the Europeans will at length succeed in opening a safe and regular route to the centre of the mysterious African continent, where so many generous missionaries of religion and of science have suffered bondage and death.

The M'Pongos inhabit the banks of the Gabon as far as the islands which surround the basin; their principal villages on the right bank are those of Kringer, Couaben, Louis, and Glass (called by the names of their respective chiefs), each village changing its name, and sometimes its site, with every new governor. Between Louis and Glass rises a wooden block-house, surrounded by palisades, and containing a garrison of Ioloffs, destined to protect the French settlement, built, as is also the Catholic mission, on a table-land overlooking the river. On a second table-land have been constructed magazines and some dwelling-houses; and it is to be hoped that the time is not far distant when a town will spring up around the settlement. An American missionary resides at the village of Glass.

The left bank is lower, and more swampy and unhealthy; on this side are the villages of Denis and Little Denis, in the former of which is to be found the original stock of the M'Pongo race; hence, doubtless, the supremacy of King Denis over the other chiefs of the same nation.

The village of Denis, situated on a peninsula, bounded on the south by the Gabon, is divided into several districts, separated by creeks, the approaches to which are swampy, so that people are obliged to make use of *pirogues* (rude boats used by the savages) to pass from one district to another. The principal street of the central district faces the river; it is long, broad, and built with tolerable regularity; the houses, which are constructed of a lattice-work of bamboo, differ little except in size. They are usually divided into two compartments; in one, the sleeping chamber for the whole family, are spread mats which serve as beds; the other contains the furniture, utensils, and provisions, and is used as assembly-room, kitchen, and store-room. Bananas, papaws, shrubs, and flowers, particularly lilies of a brilliant red, ornament and overshadow the entrance of the house, behind which stretches a curtain of bushy and luxuriant vegetation. In this street is situated the residence of King Denis, which is loftier and more spacious than the others; it is distinguished by some rude architectural ornaments, conspicuous among which are four sculptured columns, in the M'Pongo style, supporting a ledge of the roof, and thus forming a kind of peristyle.

The numerous relations of the king, who seem to constitute an aristocracy, are generally assembled behind the colonnade; and there the chief interests of the village are discussed by those who enjoy the honourable, though costly, privilege of being admitted to the royal presence, for they debate on the affairs of state over the gaming-table. The monarch employs himself almost exclusively in thus gaining the cash and other property of his subjects. No one is, in fact, so clever, or it may be so rash, as to succeed often in defeating the sovereign. The game consists in passing four hard dry berries through each of twelve holes made in a piece of wood, and of which either player has six. It is necessary to play in such a manner, that in taking the berries contained in one of the holes and placing one of them in each of the following, you come to a division in which your enemy has only two berries; that which you place there makes three, and you take; if the hole in which you have previously placed a berry also contained but two, that which has just been placed there making three, you take again; when the divisions of your adversary are thus emptied, the game is ended. The noise which the berries make, quickly handled, resembles that of dice in backgammon.

The people of the village entertain the greatest respect for King Denis; no one dares to pass before his residence when he is engaged in playing, surrounded by company, without making an obeisance. This veneration for the supreme chief has increased since he was made Knight of the Legion of Honour as a reward for the services which he rendered on several occasions to the French trade. In return for this extraordinary favour, the M'Pongos lavish upon the French all the affection of which they are capable. Upon the huts of all persons of any importance may be seen an inscription dictated by the proprietor, and written by some soldier or marine worded something in this way:—

> "Prince Bamani, good heart for Frenchman,
> Cousin of King Denis, a good courtier."

Orthography is rarely regarded in these advertisements and sometimes the writer mischievously makes some addition of this kind to the dictated encomiums: "Great thief." Far from suspecting any such perfidy, the personage thus designated shows his sign with a certain degree of pride to new arrivals, as a recommendation likely to serve his interests.

The women are also divided into two castes; those of the higher class pass their time in working necklaces, bracelets and other ornaments, of which they are very fond, with little glass beads. Seated upon low benches before their dwellings they employ themselves thus from morning to night, only interrupting their labour to fill and re-light their pipes. The women of the lower order are employed in the light labour required for the cultivation of yarns, maize, and tapioca which are indispensable to subsistence in the village. A certain number among them are, from time to time, put into requisition to remove the grass from before the royal dwelling

THE DEAD BRIDAL.

A VENETIAN TALE OF THE FOURTEENTH CENTURY.

BY JONATHAN FREKE SLINGSBY.

CHAPTER XX.

The hours of night wore slowly and wearily onward for the principal inmates of the Palazzo Polani. The count paced to and fro in the great *salone*, for he was too agitated to seek the repose of his chamber. He had struggled to the last against the fate that seemed about to bear him down and to crush him; and now he looked up at the portraits of his ancestors that hung from the walls, and felt that the glory was about to depart from his house. True it was, there was still one mode left of averting ruin, but from this he shrank with the instinct of his aristocratic nature; and even when he had at times subdued his pride, and schooled himself to look with tolerable tranquillity upon the alliance for his ward, the memory of his dearest and truest friend would cross his spirit and the features of the dead would appear to his mind's vision looking with reproachful sadness upon him, and asking him how he could betray a solemn trust, and outrage the feelings of the child committed to his care. Then, too, the horror with which Bianca heard the proposition came upon him, and wrung his heart with a pang of remorse and shame. And as his feelings alternated and swayed him to and fro, till at or

me he determined to save himself at any price, even at that
compelling Bianca to accept her suitor, and at another
solved to hazard all rather than force her to a distasteful,
nd worse still, a degrading union.

Another chamber was tenanted by one more wretched still—
ianca Morosini. Hour after hour she watched for the return
f Giulio. Hour after hour the hope, faint as it was even at
rst, which sustained her, became less and less. Midnight
ame, but with it no Giulio. She had long since dismissed
er attendant; and even old Giudetta, though she had
ntreated for permission to spend the night with her mistress,
ho she saw was seriously indisposed, had unwillingly with-
rawn, and so the girl was left to her own wretchedness.
low wretched that night was we may not say; how deep its
loom; how full of terror, and agony, and bewildering
houghts, and conflicting feelings, and passionate grief, and
hen dull, heavy, despairing apathy supervening for a season,
nd, as it were, swallowing up all emotions. And so morning
ound the girl sitting in her night-robes, without having
ought a respite in sleep even for a moment. The gray of
orning brightened into day—a sweet, sunny day; whose light
ame as if to mock her sorrow—but with it Giulio came not.
ld Giudetta stole on tip-toe into her lady's room, and found
er even as she had left her the night before.

"Santissima Virgine! my dear child, how is this?" she
xclaimed. "You have not lain down during the night.
ou are ill, very ill, I fear, and something has discomposed
ou. Come, you must take rest for a while."

But the girl resisted all the entreaties of her nurse, and
ith a strong effort concealed her feelings. To disclose even
o her faithful attendant the position in which she was placed
as revolting to her pride.

"I am not quite well, dear nurse, but I doubt not that thou
anst find amongst thy potions something that will do me
ood."

"Ah, yes, that can I," said the old woman; and she hurried
way from the room, but speedily returned with glass and
ottle.

"Here, my dear lady, take this essence, and then compose
ourself for a few minutes."

The girl took the draught, and smiling kindly on the old
oman, lay back on the couch on which she had been sitting.
iudetta's potion was a strong narcotic, which, seeing that
emonstrance was unavailing, she wisely administered. In a
ew moments her young mistress sank into a deep sleep. It
as long past midday when she awoke. She felt weary and
nrefreshed, with a sense of intolerable depression about the
egion of the heart. She was hot and her skin felt dry, while
he light even of the darkened chamber was painful to her
anguid eyes. Giudetta sat beside her watching her intently.
ianca made a movement as if to rise, but the other gently
estrained her.

"You must be quiet, dear child, a little longer. Your
ulse is quick and your eye is heavy. Compose yourself
gain."

"Has the count inquired for me?"

"No, indeed, dear child, so you need not be uneasy."

"Did he not note my absence in the morning?"

"In truth, his lordship has not been in the palace since
laybreak."

"And Giulio?"

"Tomaso says he has not been at home since yester-even;
elike he has spent the night with some of his friends. But
you must not speak more just now."

Bianca felt now that all hope of Giulio's obtaining the money was at an end; then came a vague terror and sense of calamity at his protracted absence, and she fancied a thousand accidents which might have befallen him, for she well knew he would not now be voluntarily absent from her. Her head became confused, and she felt unable to follow continuously the train of sad thought; fantasies, the most incongruous and horrible, were ever mixing themselves up with the realities of her position; thus she lay half waking, half slumbering, while the dry, burning heat of her lips and tongue increased, and throughout all she had a sense of a pricking pain in her bosom near the shoulder. So the day wore on, till it was within less than an hour of sunset. A low tap was heard at the door of the chamber. Giudetta stept softly across the room, and then Bianca heard voices whispering earnestly as if in contention.

"Impossible, Giovanna, tell his lordship she is too ill."

"Nay, mistress Giudetta, you had better bear the message to him yourself; I don't much care to meet him in his present mood. He is snapping at every one like a wolf. He has cuffed Antonio for I know not what, and Tomaso says he is worse than the grand Turk."

"Silence thy prating tongue, jade. Well, I will go myself, and do thou sit quietly on yonder stool and watch thy young mistress; but let not a word pass thy lips, chatterbox."

It was not long before Giudetta returned to the chamber; she was pale with anger and shaking with excitement, and quite forgetting the necessity for silence which she had peremptorily enjoined upon Giovanna, she gave utterance to her feelings in no gentle voice.

"Holy Virgin guard us! I believe my lord has lost his senses outright. 'Where is the signora Bianca?' said he when I entered, 'has she received my message?' 'No, eccellenza,' said I. 'No!' cried he, turning short upon me, 'who dared to withhold it?' 'I did, eccellenza; my lady is ill, and unable to rise.' Then the count ground his teeth, and glared upon me like a wild beast. 'Hark ye, Mistress Giudetta,' says he in a hissing voice, 'I am in no mood to be trifled with. Tell your young lady, that if she have life, she must attend me in this room at sunset. If she is ill,' says he with a sigh, 'I am sorry for it; but tell her she may not refuse, even on that score—she shall have time enough to nurse her ailments afterwards. Go now, and see on your peril that I am obeyed.'"

"He shall be obeyed," said Bianca, with sudden energy; for the loud speaking of Giudetta had thoroughly aroused her from her stupor, and the fever in her blood lent her an unnatural strength. "I will rise, my good nurse, thou shalt aid Giovanna at my toilette. Thine arm, Giudetta."

And the girl sat upright while the two women arrayed her; but ever as the old woman stole a frightened glance at her young lady's face, she turned pale with alarm, for her dull eye was fixed, and yet withal there was a strange wildness in it which she had never seen before. All this time the girl spoke not, but at intervals she pressed her hand over her heart and sighed deeply, as one oppressed with pain. At length her toilette was completed, and she stood erect in her ghastly loveliness, leaning on the arms of her attendants; thus supported, she left her chamber and proceeded to the grand *salone*. With a fixed abstracted gaze and a heavy step, as one who walks in a dream, she moved slowly up the apartment, and sat down upon a couch of crimson velvet. At a sign, the attendants departed, and she was left alone in the vast and silent room.

Meantime, in the ante-chamber beyond, another scene was enacting. Punctual to the appointed hour, Pietro Molo, attended by a young man, entered the hall of the Palazzo Polani, and both were ushered into the presence of the count. The old goldsmith moved up the room with that air of quiet respect and self-possession which were habitual to him: the youth followed behind him.

"I am come, eccellenza," said the senior, declining the seat to which the count silently motioned him, "according to the tenor of our agreement contained in this obligation (and he held forth the bond). If it is your lordship's pleasure to pay me the loan this day due, with the interest thereon, which I have calculated, I shall be happy to receive it, and write you an acquittance."

"Ser Pietro Molo," said the count, measuring his words as he spoke, "I have endeavoured by every means in my power to procure the money to satisfy your claim. I have three thousand ducats, and no more. If you will receive that sum and the ample security I can give you for the residue, I am prepared to pay it."

"Five thousand ducats, principal money, my lord, and five hundred, the interest at ten per centum. These sums I demand —your excellency will excuse me if I decline to take less."

The count made one appeal more.

"This youth is your nephew, I presume, Ser Molo."

"Girolamo, my brother Jacopo's son, so please your lordship," said the banker, motioning the youth to come forward.

The count surveyed him anxiously. He was a good-looking youth, dressed in a simple suit of black cloth, over which he wore his cloak, set on very primly. He had an ingenuous and modest air, but he stooped somewhat in the shoulders, and kept his eyes demurely fixed on the ground.

"As I understood from you originally, that this money belonged to your nephew, I now apply to him to know if he will be content with the terms that I offer."

The young man was about to speak, but the elder Molo thrust him aside with an impatient and peremptory gesture, and took upon himself the response.

"I told you, sir count, that the money was my brother's, sent to me to employ in a speculation for his son's use. For that speculation I alone am answerable. I feel bound to replace it, if there be any loss; and I am, therefore, alone competent to accept or decline your terms. I decline them, my lord, and now I look for the fulfilment of your stipulation. My nephew is here to receive the hand of your ward, which, on his behalf, I claim."

The Count Polani fixed on the old banker a stern and haughty gaze, in which pride and anger seemed struggling with a sense of helplessness. At first he seemed about to give vent to his passion; but there was that in the calm yet respectful bearing with which old Molo met his look, that quickly showed the count the necessity of keeping a guard upon his temper. Mastering his emotion with a strong effort, he replied,

"You shall see the Signora Morosini herself. Follow me."

The count stepped forward to the door which separated the anti-chamber from the *salone*, and throwing it open, he entered the latter followed by his two visitors. Without uttering a word, they walked slowly up the room to where Bianca was sitting in the same state of strange abstraction in which her attendants had left her.

At that moment the last rays of the setting sun streamed through the amber-tinted glass in the western window, and the soft warm light fell upon the massive clusters of her light-brown hair, till they looked like the rippling waters when the sunlight tips their edges with gold. And then the light streamed athwart her pallid cheek, and down her snowy neck, playing upon them as one sees it play upon a marble statue, illuminating without warming the white surface, which looks all the whiter and colder and more lifeless from the contrast. Thus sat the girl, passionless, unmoving, almost serene, in her solemn and sad loveliness—a thing admirable, and yet terrible and painful to look upon.

The count started at the changed appearance of the girl. He expected to see her look ill, but he was not prepared for the sight which he now encountered. It was a moment before he recovered his composure sufficiently to address himself to the task that was before him; but he had already staked too much on the terrible game to withdraw, and so he was forced to play it out. He moved up gently to the maiden, and taking her hand he said kindly:

"Here is one who seeks to make his suit to you, dear signora. You are already advised of his visit, and that he has my permission to address you."

The girl started, as if the words fell upon her ear with a sense of undefined pain, as the voice of the mesmeriser might fall upon one in a magnetic trance. A strange, fitful lustre lit up her dull eye; the look became fixed, dilated, and wild, while the orb was suffused with a red hue that added to the wildness. She half rose from the couch, and her lips moved as if she were about to speak, when a cold shivering ran through her frame, and shook her as the wind shakes the corn in autumn. She placed her hand upon her bosom, and uttering a feeble cry of anguish, she sank back upon the seat In a moment the attendants were summoned to her aid Giovanna wrung her own hands, and kissed those of her young mistress, whom she really loved; while old Giudetta, with more presence of mind, after gazing into the eyes of the girl and feeling her fluttering pulse, suddenly tore down her robe from off her neck, and directing her examination to the spot where Bianca's hand was placed, she discovered a small dark pustule raised above the skin, and surrounded with a circle of bright red. Uttering a shriek of horror, she sprang backwards and cried out,

"The plague! the plague!"

The terrible announcement paralysed every one for a moment. The count was the first to recover his presence of mind. He bent down over the girl, and looked at the place to which Giudetta pointed. There was the fatal mark, the ominous crimson carbuncle which no one who has ever seen the plague-spot can mistake.

"Aye, the plague! the plague!" he exclaimed, "as surely as there is a God in heaven!"

Then losing all control of himself, he burst into a passion of grief, such as strong men sometimes give way to. He kissed the lips of the girl now flushed and burning, and then stepping rapidly back to where old Molo and his nephew stood silent and awe-struck, he exclaimed, with a wild and mocking laugh:—

"Look there! look there! Messer Molo. Young man thou wouldst seek a noble one to mate with? Is she not here, as noble and as fair as thine eyes can desire! Come why dost thou tarry? I will lead thee to her. Yes, thou mayest take the hand of the dying! A bridal! a Dead Bridal! Wilt thou claim thy bride now?"

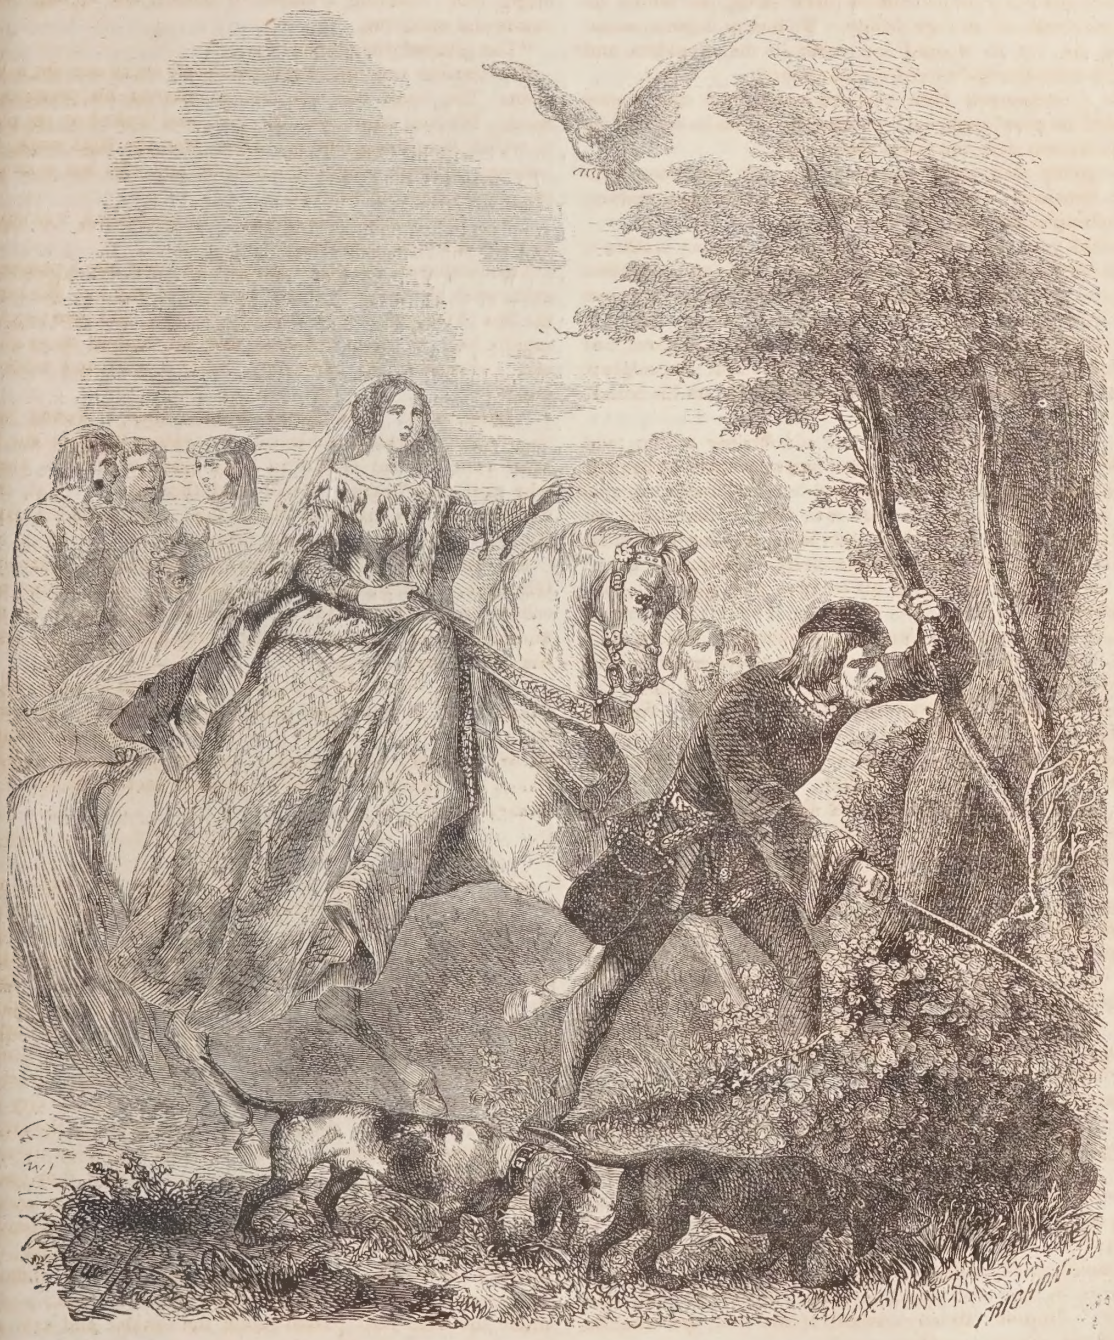
As the count spoke thus madly, he made a gesture to Girolamo, as if inviting him to advance. The young man calmly stept forward, as if about to take the hand of the now unconscious girl, when old Molo sprang after him, and seized him by the arm.

"Forbear, boy! Are you mad? Move not another step, I charge you, as you value your life.—It cannot be, it cannot be, I say.—Do you not see it is the will of Heaven?—Come let us go hence; what business have we here now?" As he spoke, the old banker forced his nephew backwards out of the house.

The plague was now indeed in the city of Venice—the terrible pestilence, whose ravages, not half a century before was still in the recollection of many living. We shall not dwell upon the horrifying details of this loathly distemper they have been delineated by more than one master hand. From the nature and situation of the city, the miasma spread wide and rapidly, notwithstanding all the sanitary precautions of the authorities, and the exertions of the officers of health. There was not a street, scarcely was there a house, in which some inmate did not fall a victim. All day long the city was as a city of the dead. All gaiety had disappeared; the streets and squares were empty; no one went forth save on the most pressing business, or to the churches; and then they passed hastily along in the middle of the street, shunning contact with their fellow-creatures. From morning till night, prayers and supplications were offered up in all the churches; the host was carried about in solemn procession, with chanting and incense, seeking to appease the wrath of God; and all night the dead-boat passed along the canals; and ever and anon it stopped at a slip, or stair-foot, or at a bridge; and the low bell was rung, and the living hurriedly brought forth their dead, themselves pale, and horror-stricken, and ghastly; and with scant ceremony, and a prayer muttered low and short they placed the corpse in the dead-boat, and then it passed on to receive other dead, till it was filled with its festering burthen, and would hold no more. And so the malady raged through the spring, and summer, and autumn, till twenty thousand souls were swept away within the City of the Lagunes.

STORY OF A FALCON.

The extensive plains of Quercy affect those who see them for the first time with a strange sensation. As far as the eye can reach, nothing is to be seen but a mass of small, hard, grayish stones, which on all sides encumber the surface of the soil. The only traces of animate nature consist in a few stunted oaks, and a narrow field, enclosed by walls, formed of pieces of rock, in which



A HAWKING PARTY.

silly and confined spot may be observed the white flower of the black-wheat. Here and there, enormous hollow blocks, twenty thirty feet long, remind you what people formerly inhabited his desert. It seems to you as if the blood of human victims ill flows in the recesses of these dismal ruins; the mind, impressed with a sense of involuntary terror, recalls the form of he Druid, with the crown of oak-leaves on his forehead and his linen tunic striped with purple, tucked up to the knee; but you see only your shadow in this discouraging solitude, and you hear no other sound than the distant bells of a flock doomed to browse on the scanty blades of grass, which here and there appear between the stones.

In this Sahara, in the midst of one of the few copses which overshadow the hills, washed by the Dordogne, between Rocamadour and Grama, you would have heard, towards the middle of June in the year 1156, the most joyous flourish which the trumpeter's skill of that period could produce. The Viscountess of Ventadour had come to visit the Lord of Montvalent, her cousin, and was hawking with her numerous train of cavaliers and retainers. Fowling being at that time the favourite amusement of

the nobility, was particularly in favour with the young lords, who were passionately addicted to it; so that the art of hunting was then considered the most agreeable branch of human knowledge. We can now only judge of the importance in which it was then held by the brisk controversies which daily arose upon the choice of falcons. Henry II., King of England, who loved his horses and dogs more than ever other Christian did, had brought into fashion the falcon of Denmark and Norway; but, either to protest against the dominion of England or from national pride, the barons of the south preferred those of the Alps. Indeed, if we are to believe the best authority of the age, Deudes of Prades, the author of "*Les Oiseaux Chasseurs*," the King of England was right. The worthy canon of Maguelonne, in his poem, which was to be found in every castle, speaks thus:

"Il est trois sortes de faucons,
Les autours, les émerillons,
Puis un petit de bonne race;
Ainsi la nature les classe.
Le danois l'emporte sur tous;
Il est plus gros, plus vif, plus doux;
Les yeux il a clairs et luisants,
Les ongles crochus et tranchants."

Now we cannot inform our readers whether the bird which had just been loosed in the woods, by the edge of the water, on the day of which we are speaking, was from Norway or from the Alps; but it flew so as to deserve the praises of its mistress, the beautiful lady of Ventadour, who, absorbed in the chase, stood upright in her stirrup, looking anxiously towards the sky; whilst two hunstmen, leading hounds in leash, kept at some distance behind her; and a little old man, whose game-pouch announced his profession, mounted on a small horse from the moors, prepared a lure in his left hand, whilst to his right the impatient chargers of some barons, whose eyes sparkling with pleasure followed the chase, stood pawing the ground.

The noble bird shot vigorously upwards; for some time it continued to mount with the same rapidity, then it was seen to stop, balance itself, and remain like a motionless point in the air, steadily observing its prey. By degrees, however, he blockaded it, that is to say, he got to windward of it, and, having gained this advantage, he commenced a hot pursuit.

It was a partridge, which, not being a match in swiftness with this cruel adversary, tried to escape him by precipitating herself into a cluster of bushes. But here a new danger awaited her; the hounds, which had been loosed on seeing her fall, plunged after her, and as if it were not enough to frighten her with their sharp and plaintive barks, the old man with the game-pouch hastened to dismount and to beat the bushes noisily with his stick.

In spite of the pleasure which every noble lady took in the chase, the Viscountess of Ventadour did not behold, without a certain emotion, the ever increasing peril of the unfortunate bird, and her desperate position. The dogs uttered yelpings of joy in the thicket, the old falconer plunged his stick into it with a sort of sinister delight; and, as pitiless as his master, the falcon, hovering above, with eager eyes and trembling claws, waited till they had forced his prey to quit its asylum. And the dilemma of the poor bird which, paralysed with terror, did not dare to move, and could only escape from the man and the dogs to find death ten yards higher, under the claws of the hawk, was indeed a piteous sight.

The lady was quite distressed, and, calling to the servant with the green game-pouch:

"Let her escape! I do not wish it to be killed, you know that I do not wish it."

"Madame?" said the falconer, as though he had not heard.

"Leave that partridge and reclaim the falcon!"

The rascal pretended to obey, but he was so long in seeking his lure, that the hounds got at the partridge and dislodged her. Choosing the slowest of two deaths, she darted away like an arrow; unhappily the falcon, warned by the cries of the old falconer, had perceived her. Vain was her rapid flight, the pursuit was still more eager, and after having for some time wheeled about in the air, she fell wounded by the attack of the falcon in a neighbouring glade.

Flushed with emotion, the viscountess urged forward her steed so rapidly, that she was in time to witness a singular scene. Some vassals, seated upon the ground, were partaking of their frugal morning meal, and seemed to be encouraging by their cries a child, about ten years of age, who was seen through the bushes. This child, who was very beautiful, and whose eyes flashed with anger, had picked up the partridge, wounded and half dead, and holding it with one hand against his breast, with the other he repelled the falcon, eager for its prey, which was flying around him, in order to seize it.

At the sight of the viscountess the vassals arose hurriedly; the falconer arrived to recall and hood the hawk; and the cavaliers, appearing from the wood, asked the fair lady what interested her so deeply. For answer, she pointed to the child, who still proudly held the partridge, as though he wished to dispute it with his lord. The first action of the viscount was to call him in his rough and commanding tone, which froze the vassals with fright; but upon a sign from his lady, he courteously gave place to her, and reined in his horse.

Adelaide of Ventadour deserved this deference. Daughter of the rich William VI., Lord of Montpellier, she had brought as a dowry to her husband, Ebles III., a hundred marks of silver, beautiful clothes, a stock of fine linen, two silver cups, weighing six marks, and the Arab palfrey which she rode with so much grace. Indeed, in order to raise her to the seigneurial grandeur of the domain of Ventadour, Ebles had divorced his first wife Margaret of Turenne, whose distant relationship to him afforded a plea for considering their union illegal, as soon as he became acquainted with Adelaide. Still under the charm of recent marriage, he listened to his lady, as the young clerks of Dalon did to the white-bearded monk who taught them chanting; all her wishes were laws, and her desires were granted almost as soon as expressed. Therefore she interrupted the viscount, whom she thought too severe; and beckoning to the child to approach:

"Wilt thou give me thy partridge for this piece of gold?" said she in a gentle voice.

"No!" replied the child boldly.

"Why?"

"Because you will let the falcon kill it."

"And if I leave it thee, wilt thou come with me?"

"No!"

"Thou wilt not follow me?"

"No: you are wicked—you made my godmother weep."

"Who is thy godmother?"

"Madame Marguerite!"

Here the viscount interrupted, and, urging forward his horse in spite of the entreaties of his lady, he demanded roughly of the vassals, whom he recognised as belonging to him, who had given them permission to leave his domain. They replied with the boldness of people protected by a superior power; for in spite of its iron law, feudalism, the brutal expression of physical force, flinched before the church, the emblem of spiritual power; they replied that they were returning from a pilgrimage to Rocamadour, to thank the saint for having heard their prayers the preceding year. The viscount now only wished to know the name of the father of the child, who had already so far made friends with the lady as to bring her the bleeding bird without being alarmed at the impatient movements of the palfrey. When her husband again came to her side, the first words which she said to him were these:

"Ebles, may I ask a favour of you?"

"Yes, lady, and if it be possible, consider it as granted."

"Do you know to whom that child belongs?"

"To a servant named Bernard, who heats the ovens at the castle."

"Do you know what I wish if he has a large family?—to keep this young boy and bring him up as my son, until God gives me a child of my own."

"Let your wish be mine!" said Ebles, bowing graciously towards the viscountess.

Young Bernard accordingly received, at the Castle of Ventadour, the brilliant education given to the sons of the nobility of the time. An old monk of the Abbey of Dalon taught him to

speak Latin grammatically, to reason, think, overthrow arguments, to sophisticate adroitly, and discomfit his adversary by eloquence, and to ornament his conversation by rhetoric. He moreover imparted to him the knowledge of the science of numbers, the four major and the four minor tones of music, and rendered him so learned that when he had reached the age of sixteen, with a robe of fine cloth and a purse at his side, he prized the pen a hundred times more than the purse, and became a troubadour.

From that time, joining to his name that of the estate of the viscount, Bernard lived gaily through the latter half of the twelfth century, honoured by the great, cherished by the towns-people, esteemed by the ladies, and popular from the Loire to the Pyrenees by the charming songs which he composed wherever he went. As in this iron age (and it is worthy of remark) wit and talent excelled, Bernard of Ventadour was celebrated during forty years; his triumphs and his gaiety only ended with the century.

An event as singular as that which began his career marked the close of it.

Forty years later, Bernard, his hair blanched with age, was looking at some tapestry, upon which Alice, Duchess of Normandy, had traced, with great truthfulness and extraordinary vivacity of colour, the hawking of Rocamadour. On beholding this scene of his native country he breathed these lines:—

"Quan la douss' aura venta
Devès nostrè païs,
Mès veiaire qu'ieu senta
Odoz de paradis. . . . ."

"Whene'er the breeze goes murmuring by,
The breeze that in my country sighs,
I vow it wafteth unto me
The rich perfume of Paradise."

At this moment an equerry entered the apartment, bringing two letters.

One was for the Duchess Alice, and announced to her that Richard Cœur-de-Lion, to whom she had long been betrothed, was about to marry a Princess of Castile.

The other, sealed with black, informed Bernard of the death of his faithful friend, the valiant Count of Toulouse.

Both were struck with a terrible blow, and took the same resolution; Alice covered that forehead, despoiled of the crown, with the veil of Fontervaulte; and Bernard, bidding a final adieu to the world, knocked at the door of the Abbey of Dalon, the port and refuge of all the vanity and wretchedness of the age.

BAHIA, THE ANCIENT CAPITAL OF BRAZIL.

The ancient capital of Brazil, officially called San Salvador da Bahia de Todos os Santos, but more generally known by the simple name of Bahia, possesses a magnificent harbour, of which some idea may be formed from the accompanying engraving (p. 357). This harbour, which gives much commercial importance to the town, has long been the admiration of mariners, and the skilful French hydrographer, whose book is now an authority in part of South America, does not hesitate to place it among the first of the numerous ports of which he gives so clear and exact a description. "All Saint's Bay," says he, "taking it in its full extent, forms a very deep gulf in the continent; this gulf, which is known by the name of *Reconcaro*, is nearly thirty miles in circuit, and receives the waters of several rivers, some of which are considerable.

"The largest fleets would be safe in Bahia, for in many situations vessels would find good anchorage secure from all gales, whilst the fertility of the surrounding country would ensure them all necessary supplies.

"On the eastern side of the principal entrance, where the ground rises in an amphitheatre from the shore, is situated the town of San Salvador, which possesses some fine buildings; it stands on uneven ground intersected by gardens, and is divided into the high and low towns. Next to Rio Janeiro, the town of Bahia is the most important in Brazil, and has a population of 100,000. Several forts, built on the summit as well as at the base of the declivity, command the coast and protect the town; the dockyard is defended by the fort Do Mar, a circular fortification built upon a bank of sand two hundred toises from the shore."

Not only is Bahia an opulent and singularly picturesque town, it is also a city of old traditions, strange memories, and even poetic legends. Brazil had only been discovered three years when, according to several trustworthy authors, whose chronology, however, is questionable, the entrance of the bay was explored for the first time by Christovam Jaques, who there erected one of those sculptured stone pillars which were then called *Padrões*, and which marked the progress of the navigators along the uncultivated shores. Seven or eight years later, about 1510 or 1511, the numerous tribes of the Tupinamba Indians, who wandered on the fertile coasts of Itaparica or Tapagipe, had had time to forget the passing of the European ship, when a vessel trading in dye-woods was stranded upon the shore of the pleasant district which now bears the name of Victoria. It is said that the shipwrecked mariners all perished, devoured by the savages, with the exception of a brave Gallician, who maintained so much *sang-froid* in the midst of peril, and displayed so much dexterity among the Indians, as to save his life and earn for himself the privileges of a chief. Arriving in the presence of the Tupinambas, who received him clamorously and with menacing gestures, Alvares Correa, seizing a stray arquebuse which the waves had cast up among other remains of the wreck, loaded it, aimed at a bird, which he killed, and the report of firearms resounded for the first time on these shores. Henceforward the young European bore the name of a dreaded animal; he was called Caramourou, in memory of the mysterious power of which he had just given proof. The tribe of Indians, struck with terror, surrendered to him; the daughter of a chief, the beautiful Paraguassou, voluntarily united her fate to his: he ruled where he thought to have perished. Tired of a life among the Indians, but faithful to his young companion, Correa left Brazil accompanied by her, and embarked in a Norman ship commanded by Captain Duplessis. But here the legend, decking itself in the most brilliant colours, and warming with the most varied incident, belies all chronology. Welcomed on the banks of the Seine by Catherine de Medici, who had been recently united to Henry II., Paraguassou, so the story runs, received baptism in an old chapel at Paris, and took the name of the young queen who acted as her godmother. Sated with the marvels of Europe, she soon left France with Alvares Correa to return to her country, where she established herself in her native village, bringing with her the fruitful germs of Christianity, and subsequently the conquerors owed to her the legal surrender of the magnificent territory upon which the city now stands.

This legend, which is in the mouth of every Brazilian, and which has even given rise to a national poem, receives no support from chronology; and the Brazilians, who now really make deep researches as to their origin, take good care to defend it, and content themselves with their own explanations. They divide the marvellous events into two parts, and attribute them to two Europeans cast on their shores about the same time; it is thus that they elicit the truth of the story.

They assert that Alvares Correa, united to Paraguassou, was the primitive founder of the city, but do not allow that he went to France; he received the first *donotario*, Pereiro Coutinho, and even shared his misfortunes; but later, in 1549, when the noble Thomé de Souza was on the eve of laying the foundations of a regular town in the midst of these warlike tribes, he became the most active agent of colonisation; he acted as *lingua*, that is to say interpreter, charged with direct-

ing the difficult negotiations which must precede the erection of a capital in a wild region, the inhabitants of which are little known. With Thomé de Souza came men acquainted with the difficult art of subduing this proud people and of commanding obedience. Navarro, Anchieta, Nobrega and others, descended the rivers of the south, in order to render their assistance to the new governor; and when, in 1557, Caramourou died in the midst of his children like a patriarch full of days, the towers of the cathedral were already rising on the verdant hill, where the vast college of the Jesuits was in course of construction.

This brief account, although very insufficient, at least serves to show to what epoch the most important edifices of this capital belong, buildings whose erection was actively continued under Duarte da Costa and Mendo de Sa, the illustrious governor, whose death occurred in the year 1577.

diluvial rains, which cause a return of the landslips. On this occasion, he gave the opinion of an experienced French engineer, Colonel de la Beaumelle, who had remarked, while staying at Bahia, the defective system of construction, and proposed to remedy it by the erection of vast buttresses, calculated to sustain the unstable ground. The wise administrator wished to adopt this system, and to undertake these gigantic works without delay. If they be not already commenced, sooner or later it will be necessary, in order to avoid the ruin of the low town, to have recourse to these Cyclopean ramparts, revived from ancient times.

We do not here pretend to name all the edifices hidden by the pleasant hills represented at the entrance of the port; otherwise we should have to describe the old cathedral (La Sé), constructed in the year 1552; the Jesuit College, built entirely of marble, by the side of which is the valuable library, founded, thanks

THE CHAPEL OF SAN GONCALO AT BAHIA.

The genius which planned so many edifices was more active than provident. The requirements of commerce increasing, houses and immense magazines, called *trapiches*, multiplied, forming the vast street of La Praya, which borders on the sea, and which is continually menaced by the fall of the enormous buildings of the high town. The disastrous events of the years 1671 and 1748, when more than sixty persons perished, crushed by the landslip, seemed to be entirely forgotten, when catastrophes quite as lamentable at last awoke the solicitude of the authorities. About eight years ago, one of the most active and provident men who have presided over the destinies of this great city, Don Soares d'Andrea, rightly informed the legislative provincial assembly, that all the precautions required by prudence having been neglected, there remained only two courses to be taken: either to abandon completely this part of the town, or to avert as soon as possible the peril by which it was threatened, especially at the season of the

to the suggestion of Don Gomez Ferrâo, from the proceeds of a lottery, in 1811; the palace of the former governors, now occupied by the president of the province; the Mint, which traces its origin back to the year 1694; the play-house, only erected in 1806; and the public promenade, planted, in 1808, by the orders of the Count dos Arcos, to whom the town is indebted for many other useful institutions. From the *Passeio Publico*, where rises the obelisk in commemoration of the arrival of John VI., we direct our steps towards the charming lake, known by the name of *Dique*, which, at only a short distance from the town, recalls all the delights of those virgin woods now only to be met with in the interior. Descending towards the low town, which also has its monuments, we may mention the Church of the Conception, which was built, so to speak, at Lisbon; for all the stones, cut and numbered, were brought thence, about the year 1623, to the spot where they were put together. We must not fail to notice the Ex-

change, a vast building, finished in 1816; the magnificent mosaic floor of which displays the richest collection of indigenous woods known in South America. Among the innumerable religious edifices we must, at least, mention the great Convent of San Francisco, founded in 1594; then San Bento, erected thirteen years previously; Los Carmos; San Pedro; the monasteries, Das Merces, Do Desterro, Da Soledad, the residence of the Ursuline nuns. We remark upon the little church of Da Graça, from the fact that it contains the tomb of Paraguassou, and notice the Nossa Senhora da Victoria because the date of 1552 shows it to be the most ancient of these religious structures. Among the many edifices belonging to different ages and various institutions, we must do honour to the attention to preservation paid by the last magistrates charged with the municipal administration. Nevertheless, it is a sketch of a ruined chapel which we offer to our readers (p. 356) as a specimen of the architecture of the eighteenth century, an age in which so many churches were erected in Brazil. On the road leading to the delightful district called Bom-Fim, may still be seen the chapel of San Gonçalo. Scarcely a century has passed since the last stones were set in its façade; agaves, palms, bananas, and even cocoa-trees, now grow in disorder around it, and completely block up its entrance. Thousands of other plants spring luxuriantly from the fissures in its walls and hasten its destruction. No pains have, however, been taken to retard its decay, which might have been easily avoided; for this chapel, constructed in 1763 by the Jesuits, in a beautiful situation, had only been completed six years before the destruction of the powerful order to which it belonged. Its decay soon commenced, and at the beginning of this century, Lendley described its picturesque ruin as one of the most interesting objects in the neighbourhood of Bahia.

THE HARBOUR OF BAHIA.

PEERS AND M.P.'S;
OR,
LORDS AND COMMONS.

SCENES IN THE LORDS.

Occasionally the hot blood of the bold barons got them into scrapes. "This day" (February 14, 1620), the journals of the Lords say, "the Lord Chancellor acquainted the house that this morning a quarrel happening between two noble members of that house, the Earls of Berkshire and Scroop, the former did forcibly push the other out of the house, against the honour and dignity of it." Both lords were called to the bar, and after serious debate, the Earl of Berkshire being called again to the bar of the house, and being on his knees, the Lord Chancellor told him that the house had considered of his fault, which they found to be very great, in that his lordship, being a peer, who therefore should be tender of the privileges of the house, had in the house, and in the presence of the prince, his highness, offered force to a member of the same. The sentence of the house, therefore, was that his lordship be committed close prisoner to the Fleet until the house should order further. The Gentleman Usher was ordered to attend the said earl to his own house at his own request, but disarmed, and from thence to the Fleet. The latter place seems to have been favourable to good resolves and profitable meditation; for a few days after we find his lordship making submission to the house, and deeply regretting the trouble his bad temper had given them.

Grander scenes have, however, been enacted on the floor of the Lords. Many a mighty heart that had ventured everything for a sinking cause, was here brought to bay by the infuriated Commons, in that fierce time when the rage of the Lower House was rapidly reaching its culminating point.

When the time for peace was past—when the tempest was rising that was for a time to destroy prince and sceptre—even in the Lords occasionally a scene occurred. Take the following as an instance:—In the middle of a dull November day, there issued from the House of Commons, after hours of earnest deliberation with closed doors, three hundred representatives of the English people, with Pym at their head. They go to the House of Lords. They seek there the greatest man in all England—a man greater than the king—a man, who might, peradventure, have saved the king's head. Mr. Pym, at the bar, and in the name of the Lower House and of all the commons of England, impeached Thomas Earl of Strafford with high treason. Bailie tells us:—"The Lords begin to consult on that strange and unexpected motion; the word goes in haste to the lord-lieutenant, where he was with the king; with speed he comes to the house; *he calls rudely at the door;* James Maxwell, keeper of the black rod, opens; his lordship, *with a proud glooming countenance*, makes towards his place at the board head. But at once many bid him to rid the house; so he is forced in confusion to go to the door till he is called. After consultation, being called in, he stands, but is commanded to kneel, and on his knees to hear the sentence. Being on his knees he is delivered to the keeper of the black rod, to be prisoner till he was cleared of those crimes the House of Commons had charged him with. He offered to speak, but was commanded to be gone without a word. In the outer room James Maxwell required him, as a prisoner, to deliver his sword. When he had got it, he cries with a loud voice for his man, to carry my lord-lieutenant's sword. This done, he makes through a number of people towards his coach, *all gazing, no man capping to him, before whom, that morning, the greatest of England would have stood discovered.*" In succeeding reigns the scenes were still in the upper house. The graceless Charles would lounge into the house, chat with some of the courtiers—look black, perhaps, at a few who were playing, under the mask of patriotism, some little paltry game of their own, and of course, peers and bishops would be decorous and well-behaved enough all the while. When stormy times came, the great Chatham, whose peerage had been to him the same cloud it has too often been to others, came down to the house to die, with that Roman air which has made his name immortal. The occasion was the recognition of American independence. Chatham then appeared in the House of Lords for the last time. Sickness and age had done their work. The strong man had become weak. Wrapt in flannel, pale and emaciated, he came into the house supported by two friends. Within his large wig little more was to be seen than his aquiline nose and penetrating eye. He looked like a dying man, yet never was seen a picture of more dignity. He rose slowly from his seat, leaning on his crutches, and supported under each arm by his two friends. He took one hand from his crutch, and raising it, cast his eyes towards heaven and said: "I thank God that I have been enabled to come here this day, to perform my duty and speak on a subject which has so deeply impressed my mind. I am old and infirm; I have more than one foot in the grave; I am risen from my bed to stand up in the cause of my country; perhaps never again to speak in this house." The reverence, the attention, the stillness of the house were most affecting. If any one had dropped his handkerchief it would have been heard. At first he spoke in a low and feeble tone; but as he grew warm, his voice rose and was as harmonious as ever; once more the old flame burnt brightly, and the feeble, tottering cripple was again the mighty orator of his manhood's prime. As Chatham was sitting down, his brother-in-law, Lord Temple, said to him, "You forgot to mention what we talked of; shall I get up?" Chatham said, "No, no, I will; I will do it by-and-by." This by-and-by never came. After the Duke of Richmond had spoken, Chatham again attempted to rise, but his shattered frame was unequal to the feelings of the dying orator. He fell back in a swoon. The whole house was agitated; political friends and political foes were alike alarmed. The scene was impressive. It needed not art to commemorate the great man struck down in the scene of his ancient greatness. Art cannot heighten the interest of that reality. From the Chamber of Peers to Hayes, and from Hayes to Westminster Abbey, to mingle his ashes with those of others of England's illustrious sons, were steps thence easily taken—steps the immortal Chatham speedily took. A few days, and England wept her greatest statesman dead.

On some occasions, the peers have shown themselves not exempt from the fears of ordinary men. For instance, when Lord George Gordon presented the monster petition from the Protestant Association to the House of Commons, an infuriated Protestant mob had taken possession of Palace-yard and the surrounding streets; Lord Mansfield's carriage was attacked, and his windows were broken; Lords Hillborough, Townshend, and Stourmont, were in danger of their lives; the Duke of Northumberland was forced out of his carriage, robbed, and his clothes were torn to pieces. The Lords, who had met to consider, curiously enough, the Duke of Richmond's scheme for annual parliaments and universal suffrage, were in a terrible state of perturbation. At first they were resolved to play the part of Roman senators, and to be massacred at their posts. But fear triumphed; Lord Montfort, looking ghastly, and covered all over with mud and hair-powder, burst into the assembly, and began to vociferate; the Duke of Richmond appealed to the woolsack for protection; Lord Mansfield tried to restore order, but Lord Montfort insisted on being heard "in an affair of life and death; for Lord Boston, coming to his duty as a peer of parliament, had been dragged out of his carriage by the mob, who would certainly murder him if he were not immediately rescued from their violence." "At this instant," says the "Parliamentary History," "it is hardly possible to conceive a more grotesque appearance than the house exhibited. Some of their lordships with their hair about their shoulders; others smothered with dirt; most of them pale as the ghost in Hamlet; and all of them standing up in their several places, and speaking at the same instant. One lord proposed to send for the guards—another for the justices or civil magistrates; many crying out, 'Adjourn! adjourn!' while the skies resounded with the hurras, shoutings, or hootings and hissings in Palace-yard. This scene of unprecedented alarm continued for about half an hour."

Perhaps one of the most exciting scenes in the Upper House was that which took place in July, 1834. It arose out of certain explanations which noble lords, members of Lord Melbourne's government, were giving at the time respecting the course which ministers meant to pursue relative to the Coercion bill for Ireland. The Duke of Buckingham, after violently attacking government, concluded by saying:—"The noble and learned lord on the woolsack (Lord Brougham) and his colleagues think they have buried the noble earl in his political sepulchre, and that he will never more disturb them; but they will find themselves mistaken; the spirit of the noble earl will burst its cerements, and will haunt them in their festivities, and disturb the noble and learned lord on the woolsack in the midst of his potations pottle deep." A scene of confusion and uproar followed, which it is impossible to describe. The Marquis of Lansdowne and Lord Brougham both rose at the same time to address their lordships, but the former gave way. Lord Brougham (labouring under great excitement and addressing his first sentence to the Marquis of Lansdowne) said, "Stop a minute. As to the concluding observations of the noble duke, all I shall say is, that I do not frequent the same cabaret, or ale-house, as he does (deafening cries of 'Order, order'); at all events, I do not recollect (continued Lord Brougham with increased energy) having met the noble marquis (Londonderry) at the noble duke's ale-house potations;—my lords, I have not a slang dictionary at hand." Here a whole host of noble lords rose, amidst deafening uproar, to address the house. Lord Brougham remained for some time on his legs, as if desirous of proceeding; but the confusion and noise, in all parts of the house, were so great as to render any effort to obtain a hearing altogether hopeless. The shout of 'Order, order,' from every side was absolutely deafening, and

ord Brougham at last resumed his seat without uttering nother word."

SCENES IN THE COMMONS.

If scenes in the Upper House be rare, they are not in the hamber in which we now are. We turn to the page of istory, and we meet with them everywhere. Whilst yet in ts infancy, before it had grown great and strong by struggling vith the strong and great, the Commons was the theatre of nany an exciting scene. We see Wolsey, when in the height of his pride, attempting to awe that house with the imperious presence which few could withstand. Passing a little lower down the stream of time, we shall find scenes constantly occurring. Discussions with closed doors—the Speaker forcibly held down in the chair to prevent the adjournment of the house—the Speaker pathetic, and in tears. A little later, and we find the house assuming the appearance of an assembly of divines, quoting Scripture, proceeding in procession to church, listening to long and wearisome prayers, and sermons longer and more wearisome still. Such were the scenes in the olden time—scenes apparently ludicrous and uncouth—scenes, however, the result of feelings which we must all reverence—which have made England what she is. Out of that rough and stormy past has come the fair and sunny present. It is in consequence of that, that we are now what we are.

"In our halls are hung
Armoury of the invincible knight of old.
We must be free, or die, who speak the tongue
That Shakspeare spake—the faith and morals hold
That Milton held. In everything we're sprung
Of earth's best blood, have titles manifold."

In the days of the bluff Harry, there occurred one of the first of the scenes which have taken place in the Lower House;—£800,000 was required, and it was thought advisable that the cardinal should go to the house and explain the purport and necessity of so large a grant. Accordingly, Wolsey went down to the house in great state, "with his maces, his pillars, his pole axes, his cross, his hatte, and the great seal." The cardinal spake of state affairs—of breach of faith by Francis I.—of the king's treaty with Charles V.; how that there was to be war, and that its estimated charges would amount to £800,000, which should be raised out of the fifth part of every man's goods and lands, to be paid in four years—the house all the while sitting in solemn silence. The imperious Wolsey insisted upon an answer. Whereupon the Speaker—no less a personage than the illustrious Sir Thomas More—falling upon his knees with much reverence, excused the silence of the house, "abashed at the sight of so noble a personage," who was able to amaze the wisest and most learned men in the realm. But with many probable arguments, he endeavoured to show the cardinal that his manner of coming thither was neither expedient nor agreeable to the ancient liberties of that house; and, in conclusion, told him "that except all the members present could put their several thoughts into his head, he alone was unable in so weighty a matter to give his grace a sufficient answer." Whereat the cardinal, we are told, got up and left the house, angry with its Speaker and every one else.

Now and then the Commons had little indignities to put up with. In Queen Elizabeth's time they were shut out of the Lords on one occasion, and great indignation was excited. In James I.'s first parliament, the House of Commons, in the person of Sir Herbert Crofts, one of its members, received a similar insult. It seemed, Sir Herbert, coming up with others to hear the king's speech in the House of Lords, had the door shut upon him, and one Ryan Tashe, a yeoman of the guard, with that cool insolence which always distinguishes your Jack-in-office, insolently repulsed Sir Herbert, saying,—"Goodman Burgess, you come not here!" This was very properly resented as an affront to the whole house, and it might have proved vexatious had not one of the officers of state made up the matter; so the house was contented with making poor Tashe acknowledge his fault, and ask for pardon, and with compelling him on his knees at the bar to listen to a reprimand from the Speaker.

One morning, as usual, the house met, but the Speaker was not there. Mr. Speaker being no less a personage than Sir Edward Coke. The house was much alarmed, and very properly went to prayers. A message was then received from the Speaker, "that he was extremely pained in his stomach, insomuch that he could not without great peril go into the air, but that he trusted in God to attend them next day." All the members being very sorry for Mr. Speaker's illness, rested well satisfied, and so the house did rise, and every man departed away.

A young member of the name of Shephard—we know nothing more of the man—in a speech on a bill for the better observance of the Sabbath, says:—"Every one knoweth that *Dies Sabbati* is Saturday, so that you would forbid dancing on Saturday; but to forbid dancing on Sunday is in the face of the King's Book of Sports, and King David said, 'Let us praise God in a dance.' This being a point of divinity, let us leave it to divines; and since King David and King James both bid us dance, let us not make a statute against dancing. He that preferred this bill is a disturber of the peace and a puritan." Sir Edward Coke delivers a severe reply. The house becomes indignant, and poor Shephard on his knees hears, "that the house doth remove him from the service of this house, as being unworthy to be a member thereof."

Charles I. had not always his own way with the Commons. From the very first troubles threatened him. When the great Sir John Eliot offered a remonstrance concerning tonnage and poundage, the craven-hearted Speaker, Sir John Finch, durst not do his duty; "he was commanded otherwise by the king." To this Mr. Selden replied: "Mr. Speaker, if you will not put the question which we command you, we must sit still, and we shall never be able to do anything. We sit here by command from the king under the great seal; and as for you, you are by His Majesty, sitting in his royal chair before both houses, appointed our speaker, and do you now refuse to be our speaker?" The Speaker replied, "He had an express command from the king, as soon as he had delivered his message, to rise." Thereupon he rose and left the chair. But the house was not to be baulked in that way. Mr. Hollis, son to the Earl of Clare, Mr. Valentine, and other members, held him in his seat. Sir Thomas Edwards and other privy councillors endeavour to free the Speaker. Mr. Hollis swears with an old-fashioned oath, that the Speaker should sit there till it pleased them to rise. Then the Speaker with tears answered, "I will not say I will not, but I dare not." Business, however, still proceeds: that disposed of, the house rises. Meanwhile the royal ear hears of it. Great indignation is felt in the royal bosom thereat. A messenger is sent for the mace and the sergeant—which being away, at once a stop is put to the business of the house. Unfortunately the house detains the sergeant, and the key of the door is taken from him and given to a member to keep. Again the king sends the keeper of the black rod to dissolve the house; but hearing that would be useless, he sends for the captain of the pensioners and the guard to force the door. The house rises in time to prevent the king having resort to this extreme measure.

The troubles and agitations of that time extended to women as well as men. Under date of February 4th, we find a very singular petition was that day presented to the Commons from several gentlewomen and tradesmen's wives in the city. On the last day of sitting, these female zealots had been observed to crowd much about the door of the Commons. Sergeant-major Shippon, the commander of the guard, applied to the house to know what to do with them; they telling him that where there was one now, there would be five hundred the next day, and that it was as good for them to die here as at home. They were pacified but for a time, and on the day referred to came down in considerable force with their petition against "the idolatrous service of the Mass." Mrs. Anne Stagg, accompanied by many others of like rank and quality, present the petition. After some time spent in debating it, we read, Mr. Pym came to the Commons' door, and called

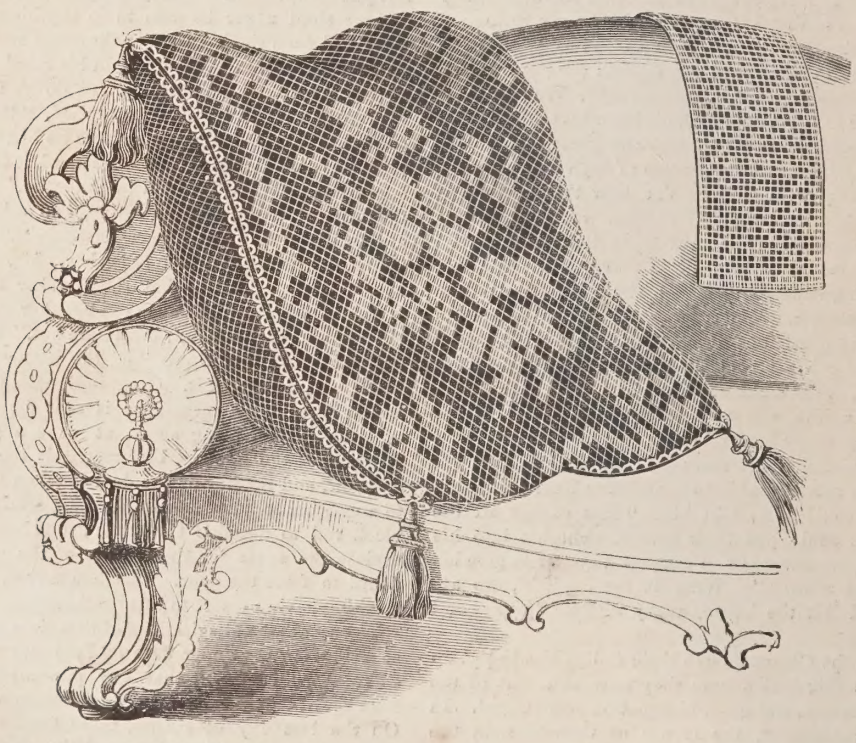
for the women and spake to them in these words: "Good women, your petition with the reasons hath been read in the house, and hath been thankfully accepted of, and is come in a seasonable time. You shall, God willing, receive from us all the satisfaction which we can possibly give to your just and lawful desires. We intreat you, therefore, to repair to your houses, and turn your petition which you have delivered here into prayers at home for us; for we have been, are, and shall be to our utmost power, ready to relieve your husbands and children; and to perform the trust committed unto us towards God, our king, and country, as becometh faithful Christians and loyal subjects." Most probably, this is the scene Butler alludes to,—

> "The oyster women locked their fish up
> And trudg'd away to cry no Bishop."

Alas, for female politicians! the fickle sex next year were quite of another mind, when they presented a petition for peace. Rushworth tells us, "that this petition was brought up by two or three thousand women, generally of the meanest sort, with white silk ribbons in their hats, and was by some of their number presented to the House of Commons, who received and read the same, and sent out Sir John Hippesley and two or three members more to return them an answer, 'that the house were in no ways enemies to peace, and that they did not doubt but in a short time to answer the ends of their petition, and desired them to return to their habitations.' But the women, not satisfied, remained thereabouts, and by noon were increased to five thousand at the least, and some of the rabble in women's clothes mixed themselves amongst them and instigated them to go to the Commons' door and cry 'Peace peace!' which they did accordingly, thrusting to the door of the house at the upper stair-head. The trained-band advised them to come down, and first pulled them, and afterwards to fright them shot powder; but they cried out, 'Nothing but powder!' and some of them in the yard, having brickbats threw them a-pace at the trained-band, who then shot bullets. Yet the women, not daunted, cried out the louder at the door of the House of Commons, 'Give us those traitors that are against peace, that we may tear them to pieces; give us that dog, Pym.'" The ladies having thus set a bad example to the 'prentice boys, Whitelake says, "that the apprentices and many other rude boys and mean fellows amongst them, came into the House of Commons with their hats on; kept the door open, and called out as they stood, 'Vote! vote!' in this arrogant manner till the vote had passed." These, however, were but little infringements of parliamentary privilege compared with that jocularly known as "Pride's Purge," when Colonel Pride, having surrounded the house with soldiers, "seized upon divers members of the Commons, some at the doors, others in the lobby, and on the stairs near the house, without any warrant or reason alleged but their sword and power, as they were going to discharge their duties."

OTTOMAN COVER.

IN SQUARE NETTING; THE PATTERN DIAMOND.



MATERIALS:—Brooks' Goat's-head Netting Cotton, Nos. 30 and 36; Embroidering, No. 40; Steel Mesh, No. 12, and Steel Netting Needle. For the upper side of the cushion use No. 36 Cotton, and commence with one stitch, and make one at the end of every row until you have 83 loops on your mesh; then decrease one at the end of every row until you have only one left; then fasten off; then darn it with Embroidering Cotton, No. 40, according to the engraving, always taking care that there are the same number of threads in every square, and that the threads all run the same way, making as few breaks in the cotton as possible; in fastening off, or beginning again, always let it be on the under side, that the ends may not be seen. Then, for the under side of the cushion, make another piece exactly similar to the other one in size, but with a thicker cotton, No. 30. The two pieces must then be joined together, and placed upon a cushion stuffed with wool and covered with a dark purple, crimson, or green velvet; the whole afterwards finished with a thick twisted cord in two colours, with massive tassels at the corners to match.

CROMWELL DISCOVERING THE LETTER OF CHARLES I. AT THE BLUE BOAR, HOLBORN.

The reader of history must be dull indeed if he do not learn, in the language of the poet, that

"Uneasy lies the head that wears a crown."

If we look back upon the history of England, we shall see how with reference to most of her rulers this might be said. It is true, only one king became insane—only one was driven to die an exile in a foreign land—only one lost his life at the scaffold; but even those to whom such terrible catastrophes did not occur, could, we doubt not, bear testimony to the fact, that grief and sorrow are to be met with in the palace of the king as well as in the hut of the peasant. Placed above their fellows, princes rarely hear the voice of truth; they are surrounded by needy parasites and dependent courtiers; the struggle for life, which is such a bracing exercise to others, they know nothing of. They have nothing to look forward to, nothing to hope for, higher than the position they have already obtained. If a crowned head has not real cares, it has imaginary ones. The only merry monarch we read of in our history was Charles II., and his was the merriment of the sensualist and the fool.

But the usurper—the man who works his way upwards to a throne—has greater troubles still. On every side he has foes. Every moment he expects to be dragged down from his high eminence. It is the necessity of his position that he must be suspicious—that he must have recourse to espionage—that he must be keen at plotting himself, and detecting the plots of others. In this respect there is a great resemblance between the great Cromwell and the great Napoleon.

The Blue Boar in Holborn is famed as the scene of one of Cromwell's clever exploits in this character. In Morrice's "Life of Lord Orrery" we have the account as it came from Cromwell's lips. Morrice writes:—

"One time, when Lord Boyhil, and Cromwell, and Ireton were riding together, they fell into discourse about the late king's death. Cromwell declared, that if the king had followed his own mind, and had had trusty servants about him, he had fooled them all. And further said, that once they had a mind to have closed with him; but upon something that happened, they fell off from their design again. My lord, finding Cromwell and Ireton in good humour, and no other person being within hearing, asked them if he might be so bold as to desire an account, first, why they once would have closed with the king; and secondly, why they did not? Cromwell very freely told him he would satisfy him in both inquiries. 'The reason,' says he, 'why we would once have closed with the king was this—we found that the Scots and the Presbyterians began to be more powerful than we, and if they had made up matters with the king, we should have been left in the lurch. Therefore, we thought it best to prevent them by offering first to come in upon any reasonable conditions. But while we were busy with these thoughts, there came a letter from one of our spies, who was of the king's bed-chamber, which acquainted us that on that day our doom was decreed; that he could not possibly tell what it was, but that we might find it out if we could intercept a letter from the king to the queen, wherein he declared what he would do. This letter, he said, was sewed up in the skirt of a saddle, and the bearer of it would come with the saddle on his head, about ten o'clock that night, to the Blue Boar in Holborn; for there he was to take horse and go to Dover with it. This messenger knew nothing of the letter in the saddle, but some persons in Dover did. We were at Windsor when we received the letter, and immediately upon the receipt of it, Ireton and I resolved to take one trusty fellow with us, and with troopers' habits to go to the inn in Holborn; which, accordingly, we did, and set our man at the gate of the inn, where the wicket only was open to let people in and out. Our man was to give us notice when a person came there with a saddle, while we, in the disguise of common troopers, called for cans of beer, and continued drinking till about ten o'clock. The sentinel at the gate then gave notice that the man with the saddle was come in. Upon this we immediately rose, and as the man was leading out his horse, saddled, came up to him with drawn swords, and told him we were to search there all that went in and out there; and as he looked like an honest man, we would only search his saddle, and so dismiss him. Upon that, we ungirt the saddle, and carried it into the stall where we had been drinking, and left the horseman with our sentinel; then ripping up one of the skirts of the saddle, we there found the letter of which we had been informed; and having got it into our hands, we delivered the saddle again to the man, telling him he was an honest man, and bidding him go about his business. The man, not knowing what had been done, went away to Dover. As soon as we had the letter, we opened it, in which we found the king had acquainted the queen that he was now courted by both factions—the Scotch Presbyterians and the army, and which bid fairest for him should have him; but he thought he should close with the Scots sooner than the other, etc. Upon this,' added Cromwell, 'we took horse, and went to Windsor; and finding we were not likely to have any tolerable terms from the king, we immediately, from that time forth, resolved his ruin.'"

THE DEAD BRIDAL.

CHAPTER XXI.

It was the third day after that upon which Bianca Morosini fell ill. In a room of a mean house in the quarter of San Barnabo a young man lay upon a pallet. An old woman, in the attire of the poorest of the people, sat beside him and watched him as he slept. At length the sleeper awoke and opened his eyes.

"What hour is it, good mother?"

"It is just sunset, signore. The Ave Maria is ringing."

"Ah, then I have slept many hours, and feel much refreshed."

"The saints be praised!" said the old woman, "the medicaner said that the fever was gone, and that when you woke all danger would be over. Ah, Signor Giulio, he says you had a narrow escape; had the wound been an inch deeper it would have been mortal. Do you know the villain who struck you?"

"I know nothing, good Giovanna, except that, as I left my gondola, after coming from Mestre, and had just past the church of San Barnabo, a man in a mask and cloak sprang on me suddenly from the shadow of the portico, and struck me in the back with a dagger. I fell down, and remember nothing further till I found myself lying here."

"Ah, yes, signore, you swooned; and, as God willed, my Antonio was just then returning from the canal, and seeing you lying bleeding, he raised you and brought you in here, as it was nigh at hand; and then, when he found who you were, he went for the skilfullest chirurgeon in Venice."

"I owe him much, and thee, too, good mother. But tell me now, what news from the palazzo? Hast thou been there?"

"Yes, signore; but I could see no one—the mark was on the house."

"In the name of heaven explain yourself," cried Giulio Polani. "What mark dost thou talk of?"

"Ah, signore, the mark placed by order of the Signori alla Sanità. The plague is there. It has been in the city these three days."

"I must arise, good mother," said Giulio, when the first shock of the intelligence was passed.

The old woman remonstrated as far as she dared, but her guest was not to be controlled.

"I tell thee, I feel strong enough to rise and go out—the air will serve me; besides, were it otherwise, the uncertainty and suspense is intolerable. I must know the worst. Thou canst not tell me who is seized with the distemper?"

"No, truly, signore; neither I nor Antonio could learn. But since you insist on rising, I beseech you to wait till I fetch my son to attend upon you; I shall not be long away."

No sooner had the old woman gone to seek the boatman than Giulio arose from his bed. He was still weak from loss of blood, and the stiffness of his wound impeded him; however, he contrived to put on his clothes, and taking advantage of the absence of Giovanna, he left the house. The cool evening air revived him, and he made his way slowly along the narrow streets, pondering sadly upon the fatality that had fallen upon himself and his house. In the bitterness of his heart he believed that Providence had intervened specially to crush him. The unfortunate stroke that prevented him reaching home on the evening of his interview with Jacques, was, he felt certain, dealt by no robber's hand; for neither his purse nor the bills had been taken; nor could he think of any one whose enmity he had incurred, who would have him set on by a bravo; he, therefore, came to the conclusion that the ruffian had mistaken him for some other person. Then he bewailed the precious time that was lost while he lay in the delirium of fever. What might not have occurred in the interval? Might not Bianca, when she found he did not return, have yielded to the importunities of his father and accepted the suitor thrust upon her? His heart quickly rejected the thought, as one unworthy of her who had plighted to him her faith. What! if it were she that was seized with the plague—perhaps even now dying or dead! The thought was maddening and made him sick and faint, so that he was forced to pause a moment and lean against a doorway for support. Twilight by this time had nearly faded into night, and as he looked up, a light glimmering in the window of a house on the opposite side of the *calle* attracted his attention, and in the dim evening light he was enabled to decipher, inscribed in large letters upon a board:

"*Qui si puo consultare un' Astrologico famoso: il piano secondo.*"

It is a well-known historical fact that, during the prevalence the plague, the popular terror took the direction of superstition. This terrible disease was looked upon as a direct manifestation of the Divine displeasure, and whoever professed to be able to discover the secret councils of God, as manifested by the appearance of the stars or the influences or conjunctions of the planets, was sure to be consulted by the people. If this were so in our own land, at a much later period of the world, it is not to be wondered that in Venice, in the fourteenth century, the astrologer and fortune-teller drove a thriving trade. Giulio's eye rested on the inscription, while those harassing doubts were rising in his mind, and the words seemed to address him directly, and invite him to seek a solution of them by learning the hidden designs of Fate. He crossed the street, ascended the stairs to the second story and knocked at the door. It was opened by a stunted-looking Moorish boy, who, without speaking, held out his hand for the accustomed consulting fee, and then ushered Giulio into the apartment of the astrologer.

It was a square room, dimly lighted by an iron lamp that was suspended from the centre of the ceiling by a triple chain of the same metal; a blue inconstant flame glimmered from the vessel, emitting a strong sulphurous smell, and causing all the objects in the room to flicker, and, as it seemed, to move to and fro. Stuffed reptiles and animals of the most unsightly form hung from the ceiling—bats, toads, frogs, and serpents—and cast their distorted shadows athwart the walls and the floor, where, as the light leaped fitfully up and down, they seemed to crawl and hop and writhe in convulsive motion. The walls were hung with horoscopes, ephemerises, zodaical signs, and tables of dignities of planets, and other astrological diagrams. A table, covered with black cloth, stood nearly in the centre of the room, the light of the lamp fell obliquely upon it and played in the eyeless sockets of a human scull, beside which sat a large vulture. On the middle of the table, a little to one side, stood a mysterious instrument; the pedestal was flat and circular, about two inches thick, formed of a composition termed by theurgists, *electrum magicum*, and was inscribed with the holy name ELOHIM in Hebrew characters; from this sprang a pillar, which supported a large oval crystal, set in a frame-work of gold, around which was written in Greek the name of the Supreme Majesty, TETRAGRAMMATON; four smaller crystals were set at equal distances around the larger one, indicating the animal, vegetable, mineral, and astral kingdoms; while from the top rose a fifth, representing the great Δ or equilateral triangle—the mystic symbol of divinity. At the other side was a large bell, made likewise of electrum magicum, having written upon its outer surface the word TETRAGRAMMATON, and higher up SADAI; behind and between these two strange objects appeared the astrologer himself. He was clothed in a flowing robe of black silk, trimmed down the front and at the edges with flame-coloured velvet; his head was covered with a high cylindrical black cap, and he held a white wand in his hand; the base of the lamp was so placed, whether by design or accident, as to throw his face into shadow. Giulio had ample time to observe all these things as he stood before the astrologer, who seemed buried in such profound contemplation of a paper before him, as not to be sensible of the entrance of a stranger. At length he raised his head and beheld his visitor. He betrayed no surprise whatever, but said in a low, solemn voice—

"Signor Giulio Polani, thou art welcome—I have expected thee."

The young man started with astonishment to find himself recognised by one to whom he believed himself a total stranger.

"How is it that you know me?" he asked. "We have surely never met before to-night."

"To the eye of science," replied the astrologer, "all things are revealed. He who can decipher the characters of the inner life, can easily read the external inscription. Thou comest to consult me. Of thyself or of others?"

"I would seek to know the fate of another than myself."

"Canst thou declare to me the year and day, and if possible the hour, of her nativity?"

"*Her*," cried Giulio in surprise; "I said not it was a woman!"

"True, thou didst not, nevertheless it is so. Canst thou tell me what I require?"

"I can," said Giulio, and he named the year. "I know, too, the very day and hour; for I have often heard her say that she was born at the moment that the bells of Saint Mark rang in the new year."

"'Tis well," replied the astrologer; "I will now calculate for thee her horoscope."

Thereupon he took a paper upon which was a diagram of that peculiar figure which is known to the adept of the occult sciences as a horoscope. First there was a square, within which was inscribed another similar figure, so that the angles of the latter touched the centre of the sides of the former, within this was again drawn another square whose sides were parallel to the external one, and from its angles lines were drawn to the angles of the outer square. By this means twelve triangles were formed in the space between the inner and outer squares, and were denominated the twelve houses. The astrologer then took an *ephemeris*, in which he ascertained the position and conjunctions of the heavenly bodies at the time indicated in the nativity of the person whose fortune he was about to predict, and these he noted carefully upon the horoscope. In the same way he consulted "the table of dignities," and noted the results of his calculations as he had done those of the ephemeris. As he thus proceeded, he muttered to himself many strange words, amongst which a portion were now and then vaguely intelligible to his visitor.

"Ha! the moon is Hyleg, and she is receding from the sun—see, she is under his beams too.—Ah, she will be short-lived of a verity."

Then he was silent for a space, still busily calculating: again he spoke slowly—

"She is sick—a sore sickness. The moon is corrupt—afflicted of Saturn in the three first degrees of Scorpio—Death! Death!"

By this time the suspense and agony of Giulio were intolerable; he groaned aloud. The astrologer's calculations were complete; he looked up and spoke in a solemn voice, in which there was somewhat of sorrow and pity blended—

"Young man, we are the ministers and the interpreters of nature; not her lords. We cannot control the stars; we but declare in speech the knowledge which day and night they utter in their mysterious language. I have calculated the horoscope according to the nativity thou hast given me. Listen whilst I announce it. A maiden was born at that moment when the planetary influences were inauspicious—even now she is weighed down by a fatal malady. In vain do the stars in the ascendant houses strive to overcome the power of those in the cadent. The signs in the twelfth house betoken tribulation; in the eighth there is death!—aye, even now the hand of death is upon her. She enters the fourth house—the end of all. Before the morrow's sun she shall be a corpse!"

Giulio staggered forwards; a faintness as of death came upon him, and he would have fallen to the ground, but that the astrologer arose and caught him in his arms. Pouring forth from a phial a few drops of a volatile fluid into a glass of water, the astrologer forced it into the mouth of the fainting man. The pungent elixir caught his breath, giving a sensation of choking; but it speedily restored him. At this moment the light of the lamp fell directly on the face of the astrologer as he bent over his visitor, and Giulio recognised with a shudder the glittering eye and scarred forehead of Bartolomeo Venturini!

The young man found himself, he scarce knew how, once more in the street before the house of the astrologer. He felt a terrible composure, as if of despair. "It is in vain," he muttered, "to struggle against destiny. Come, I will play the play out to the end—I will be near her when she dies—I will die with her if it may be so." He moved onwards with such speed as he could exert through the dark vacant streets till he reached the cortile at the rear of the Palazzo Polani. Just then the postern door was opened, and one came forth carrying a torch, followed by two others who bore a litter, upon which lay a figure covered over with a white linen cloth.

"Be quick," said he who held the torch, "I hear the bell ringing at the bridge—we shall scarcely be in time."

Uttering a wild cry, Giulio sprang forward to cast himself upon the bier, when the strong arm of the torch-bearer held him back, exclaiming—

"Are you mad, good fellow, or weary of your life? She has just died of the plague. Oh, Cielo!" he added, as the light of the flambeau showed the features of him he addressed, "it is our young master Giulio!"

At the time when Giulio Polani fell into the arms of the servant outside the palazzo, within it were silence, and gloom, and sorrow; for the shadow of death still hung over it, nor departed with the corpse just borne away. One now stept noiselessly through the gloomy hall, and up the wide marble staircase, and along the corridor. He was dressed in the Greek costume, and wore on his head a close-fitting black skull-cap, beneath which fell down a profusion of hair white as silver, while a long beard of the same colour hung down upon his breast. As he moved along, he sighed and said musingly:

"Alas! Death is a blind mower; the green and unripe fall beneath his sickle even as the ripe and the withered—the young maiden equally with the old man. Ah! that he may be satisfied with this one poor victim, and spare these others who are now in his grasp."

As he concluded his soliloquy, he reached the door of a chamber, and gently opening it, he entered. The light of a shaded lamp disclosed an old woman watching near a bed, which lay in the shadow. The man went up to the couch, and bending down his head, listened in silence; then turning to the woman, he said:

"This sleep is calm and refreshing; the breathing is natural and easy: how long has it lasted, Mistress Giudetta?"

"Since I gave the draught, Ser Demetrius; I think it must be near half an hour."

"'Tis well. Hold hither the lamp. Ah, yes, the face is losing the haggard look, the redness about the eyelids is abated. Let me feel the pulse. So—no flutter—no sharpness—tranquil and regular; and the skin is no longer dry, but a warm moisture is breaking out through the pores. Good, good!"

"The Virgin be praised!" said Giudetta; "then we may have hope?"

"Assuredly we may hope; the vital functions are rallying. The event is, however, in the hands of God. If thy patient should wake before I return, thou wilt administer this aromatic potion. And now I must attend elsewhere."

The mediciner was leaving the room, when the old woman said to him entreatingly:

"Ah, good Messer Demetrius, I wish heartily that your worship would give me one of those wonderful and blessed amulets, which keep off this deadly disease. I remember in the great plague, when I was a little girl, people always wore such about them. Doubtless so learned a man as you must know how to compose many such."

"Of a verity I do," replied the physician, "and I am not unwilling to comply with thy request. This pestilence is one of the arrows of God wherewith he slays man for his sins, as saith the erudite Claudius Galenus, 'Pestis est flagellum et sagitta Dei, ob peccata hominibus immissa.' Wherefore it is lawful for us to use such things as a shield; nevertheless, we must by no means pretermit the use of medicaments and therapeutics, which are as weapons wherewith to assail and drive away the foe."

"Your worship no doubt speaks wisely and learnedly," said Giudetta, her reverence being in exact proportion to her ignorance of what the physician somewhat pedantically enunciated. The latter thereupon took from his pouch a piece of parchment, whereon he inscribed several letters, between which at various intervals he drew the sign of the cross, and then handed it to Giudetta, saying:

"This amulet is of a most holy significancy, and of marvellous virtue against the plague. It was composed by a certain Greek archbishop, and by him was given to the learned Hieronymus Bardius, doctor in theology and medicine, of whom I had it. Wear it constantly round thy neck, put thy confidence in God's mercy, and have a cheerful spirit."

Giudetta took with profound reverence the sacred talisman, and the physician departed.

AMATEUR ARTISTS.

Sovereigns and other eminent personages have not unfrequently been glad to seek relief from the pressure of weightier affairs in the cultivation of art. A long list of distinguished names might be drawn up to which this remark is applicable. The royal family of France has been peculiarly rich in such names. It is with great probability supposed that Charlemagne—the founder of the Germanic empire, and the head of the Carlovingian dynasty of French sovereigns—spent some of his leisure hours in the illumination of missals. Among other members of this family who have occupied themselves in such pursuits, may be mentioned the Grand Dauphin, son of Louis XIV.; one of the Dukes of Burgundy, who, about the years 1694 and 1698, executed several engravings from the works of distinguished artists; Louis Charles of Bourbon,

DRAWING WITH A PEN BY LOUIS XV. WHEN A CHILD.

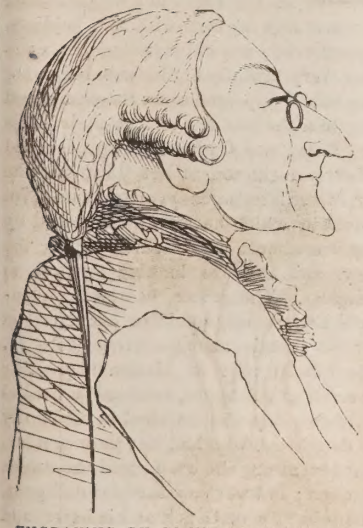
FAC-SIMILE OF AN ETCHING BY LOUIS XVI.

ETCHING OF A LANDSCAPE BY DUKE DE CHARTRES (PHILIPPE EGALITE).

Count d'Eu, who also engraved with much skill; Louis Henry of Bourbon, whose drawing was of a superior order; Louis of Bourbon, and the Count of Clermont, who produced an excellent engraving of a landscape in the style of Coypel. The passion of the good King Rene of Anjou for the fine arts is well known—an unfortunate passion, which withdrew him too much from a due attention to the affairs of state, and at the same time was not crowned with any great success, if we may judge from the specimens he has left of his artistic skill. Mary de Medicis also deserves to be mentioned for her bold wood-engraving of the bust of a distinguished woman who lived in the middle ages.

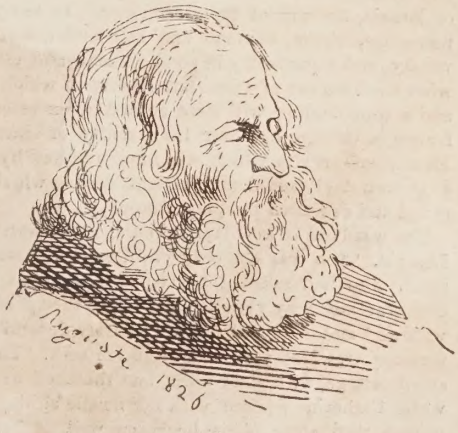
The collection of drawings and engravings by amateurs in the print department of the *Bibliothèque Nationale* at Paris, includes a vast store of curiosities, to some of which we venture to call the reader's attention. In the portfolio of the Grand Dauphin, son of Louis XIV., there is a view of the Escurial Palace at Madrid, where his mother, Maria Theresa, and his grandmother, Ann of Austria, were brought up, and where his son, the Duke of Anjou, afterwards reigned. Upon a leaf are five sketches traced with a pen by Louis XV. when a child, four drawings of little houses, and the two dogs, of which we give a *fac-simile* (p. 356). In the King's Library there is a collection of pen-sketches by various princes of the royal family, from Francis I. downwards. Among these are some by Count d'Artois (afterwards Charles I.); the Count de

A LANDSCAPE BY THE BARONESS OF HERLAC.



ENGRAVING BY COUNT HESSENSTEIN.

DRAWING BY THE PRINCESS CHARLOTTE.



DRAWING BY EUGENE NAPOLEON OF LEUCHTENBERG.

Provence (afterwards Louis XVIII.); and the Dauphin (afterwards Louis XVI.). We have reproduced a well-executed etching (p. 356) of a *fleur-de-lis* garland, with a symbolical trophy of a cock, arms, and objects of art, by the last of these princes.

The landscape by the Duke de Chartres, which forms our third illustration (p. 356), is the production of a genuine artist. This Duke de Chartres could be no other than Louis Philippe Egalité, so familiar to those who have read of the first French revolution; for on a leaf of the portfolio containing his engravings it is stated that he was born in 1747. Besides the natural taste for art which distinguished his family, he had a good master in L. C. de Carmontelle, who was an agreeable and faithful attendant, and after whom he engraved a small plate called "The Manœuvre of St. Cloud," in the year 1764. His six landscape etchings are really masterly productions.

It is not easy to determine the origin of the charming landscape by the Baroness of Herlac, as she is termed in the manuscript (p. 357). It is by some thought to have been etched in 1756, from a drawing by Leprince, whose name appears on the margin of the plate. The pointed, lean, and slender figure (p. 357), like that of a gentleman-usher or a bailiff, was engraved some years later by Count Hessenstein, from an original design by M. de Hamilton, who intended this to be accompanied by a huge, fat, thick personage, with immense paunch and perruque.

Our readers will naturally feel more interest in the next illustration (p. 357), which is a drawing by the Princess Charlotte, whose premature and melancholy death threw such a gloom over the nation, no less on account of the singular private virtues which endeared her to the country, than the interest attaching to her position as heir-apparent to the throne. Eugene de Beauharnais, the former viceroy of Italy, who enjoyed equal popularity, was the father of the amateur artist who drew the last figure on the preceding page. The son, Eugene Napoleon, of Leuchtenberg, who was a cousin of the present Emperor of the French, married the late Queen of Portugal, whom he left a widow. There is a series of seven small etchings by him, the first of which is represented in our engraving.

THE EARLY LIFE OF CATHERINE THE GREAT.

THERE never was a greater contrast presented in the life of any woman than that which appears in the life of Catherine of Russia, the wife of the great Peter. In her youth we find innocence, virtue, courage and self-denial, fortitude in adversity, and equanimity in good fortune and elevation. But what shall we say of those latter years in which great talents and a commanding will were sullied by excesses such as no female sovereign has ever been guilty of since the days of Messalina—cruelty which was never relieved by remorse, and a thousand shameful and violent deeds, which utterly unsexed and degraded the perpetrator?

She was born in a village near the little town of Dorpal, in Livonia. She was the only child of her parents, poor peasants, who had nothing to bequeath her but their virtues. She was still very young when her father died, leaving her widowed and decrepid mother entirely dependent upon her for support. Nobly did she fulfil her task. They lived in a small cottage with mud walls, and thatched with straw; and while Catherine worked with her needle all day long, the old woman read some pious book, as well as her feeble sight would allow; and when night fell, too poor or too frugal to light a candle, they sat round their fire talking, and were content and happy.

Catherine excited great admiration in her neighbourhood. She was tall, her figure was symmetrical, her skin was white as driven snow, and her face was "the fairest that e'er the sun shone on." She walked to perfection;—the coquetry, and withal the grace and stateliness of her pace, were the envy of the village maidens, who all endeavoured to imitate her. But there were some things in which it was not easy to imitate her. She evidently set very little value upon bodily charms as compared with mental acquirements. Her mother had taught her to read; the old Lutheran minister of the parish had instructed her in the truths of religion; and to these advantages she added quick observation, sound judgment, and a strong but well trained imagination. She got many offers of marriage from peasants in the neighbourhood, but declined them all, declaring she could not leave her mother. But the latter died when she was but sixteen, and she then gave up the cottage, and sought an asylum in the house of the minister, as governess of his children. So great was her vivacity, her amiability, and her prudence, that he came to love her as his own daughter, and employed masters to teach her music and dancing, and every other accomplishment that could add to her charms. These were the happiest days of Catherine's life. A pure and simple heart beat within her breast; she was budding into womanhood, and surrounded by every fascinating grace. The time passed along pleasantly, teaching the children their lessons, talking with the good pastor, reading, singing, dancing, gardening. Oh, what a pleasant vision to the maiden's fancy was the great future and the great world which lay outside the walls of the parson's modest dwelling!

But "fine times," says the proverb, "do not last always." The minister died, his household was broken up, and Catherine once more found herself cast alone upon the world. But not helpless. She was a brave girl, and was nothing daunted, though Livonia was at that time utterly desolated by the war which was raging between the Swedes and Russians with frightful fury. Lawless marauders and brutal soldiers crowded every highway, and spread terror and confusion through every dwelling. Food was every day becoming scarcer, and Catherine made up her mind to go to Marienburg, a large town, where she hoped to find plenty and employment. Marienburg, be it remembered, was some days' journey distant; the way lay through a dreary, desolate country, and the hostile forces were ravaging it in every direction. Fancy what a stout heart she must have had then, when she set out on her journey on foot, her wardrobe tied up in a bundle, a small sum of money in her pocket, and without knowing a soul in the town to which she was going. And yet this she did. One evening towards sunset, just as she was about to seek lodging for the night in a neighbouring farmhouse, she found herself face to face with two soldiers, who seized her, and commenced, notwithstanding her cries and entreaties, using her very brutally. She was becoming exhausted, when a young officer appeared upon the scene, and immediately upon seeing him the soldiers took to their heels and made their escape. What was Catherine's surprise and delight to find in her deliverer the son of her old friend the Lutheran minister. Never was meeting more opportune. Not to mention the predicament in which he found her placed by the soldiers, her money was almost expended in paying the expenses of her journey, and she was looking forward to entering the town penniless. The officer, however, replenished her purse, procured her a horse, and gave her letters of introduction to some of his friends, amongst others to a M. Gluck, who held some official post in Marienburg. She accordingly presented herself at his house, received a cordial welcome, and on the following day was installed in his family as governess of his two daughters, who had lost their mother. Though she was still but seventeen, she discharged the duties of her new office to perfection; and was so graceful, intelligent, and captivating, that she robbed poor Gluck of his heart, and he begged of her to take his hand as well. What was the surprise of the dignitary when she refused him! aye, and refused him with the dignity of a queen,—refused him as she had refused the peasants of Dorpat two years previously,—she, the orphan and outcast, who had so lately come to his door, way-worn and desolate!

Probably, our readers now think that Catherine already heard the whisperings of ambition, and that she had a secret presentiment of the great elevation that awaited her. Nothing of the kind. Let us do her justice; she refused to marry

M. Gluck for a reason that all ladies will appreciate and approve—because she loved another, and that other neither king nor emperor, but a poor subaltern officer, without fortune or influence, with but one arm, and hacked and shattered from head to foot with bayonet and ball, the son of her old benefactor, the same who had succoured and delivered her when desolate and sore afraid. Ah! Catherine was still a woman, brave, single, and true.

She immediately left M. Gluck's house, and when the officer returned to Marienburg, somehow or other they came to know that each loved the other, and they agreed to get married. Their nuptials were celebrated with a great deal of simple rejoicing, but on that very evening the town was attacked by the Russians, and the bridegroom left the altar to rush to the battery.

He never returned. Whether killed or captured, Catherine never knew; but she never saw him more, and thus found herself a widow and a bride within twelve short hours. She watched that night in sorrow and anxiety, and the morrow came, and another and another, and the siege raged with undiminished fury, till at last the town was carried by assault, and the Russian hordes spared neither age nor sex. When the slaughter was over, Catherine was found hidden in an oven. In the division of the booty, she was allotted to a soldier as a slave. She had lost her property, her husband, and all her friends, and now at last had lost her liberty. But even this new misfortune did not subdue her. She was still cheerful, pious, and resigned, and her lofty and calm dignity awed the brutal men who surrounded her into gentleness and humanity. The fame of her beauty reached the ears of the Russian general, Prince Menschikoff. He saw her, purchased her, and placed her in his household under the care of his sister. Here she grew in beauty, both of feature and character, as she grew in years. She was a favourite with everybody. Shortly afterwards the Czar, Peter the Great, visited the prince at his house. Catherine was ordered to hand round some fruit, and her appearance astonished the emperor. He went away thoughtful, and returning on the morrow, asked to see her. He heard the simple story of her life with deep interest, was captivated by her charms and her heroism, and married her. The Livonian peasant girl was now on the throne of a great empire.

THE HON. FRANCIS HINCKS,

PRIME MINISTER OF CANADA.

This gentleman, to whose enlightened mind and patriotic spirit Canada is so deeply indebted, is the fifth and youngest son of Dr. Hincks, of the family of Hincks, of Breckenbrough, in Yorkshire, which traces its origin to William Hincks, an alderman of Chester, in 1641. Dr. Hincks, who settled in Cork in 1791, was an active member of the various benevolent societies in that city. He was minister of the Princes-street Presbyterian Congregation, and secretary of the Cork Institution; and was also distinguished for his success in the instruction of youth, several educational works that he published having had a large circulation, and many of his pupils having risen to eminence in their respective professions. In addition to the ordinary branches of school education, he gave lectures on natural philosophy, chemistry, and natural history, which were open to others as well as his immediate pupils, and which led to the establishment of the Cork Institution, of which he may be regarded as the founder. In January, 1815, he removed to Fermoy, in consequence of obtaining the mastership of the classical school there, founded by John Anderson, Esq.; and in July, 1821, to Belfast, having been elected head classical master and professor of Hebrew in the Royal Institution of that city.

Edward, the eldest son of Dr. Hincks, obtained a fellowship in Trinity College, Dublin, in 1813, and is now rector of Killyleagh, a college living, which was formerly of considerable value. He is the author of several papers in the Transactions of the Royal Irish Academy, on subjects connected with Egyptian, Persian, and Assyrian archæology. In the two latter his discoveries have attracted much attention, in connexion with those of Colonel Rawlinson, the same results having, in several instances, been obtained almost simultaneously, by the one at Killyleagh, and by the other at Bagdad. He was the first to determine the forms and values of the Assyrian numerals, from an examination of ancient inscriptions at Van, an account of which was published in the Journal of the Asiatic Society.

The second son, William, is distinguished as a naturalist; he was the first professor of natural history in Queen's College, Cork, and has lately obtained a similar appointment in Toronto, Upper Canada. The third son, Thomas, has been curate of Belfast, and is the prebendary of Cairne Castle; he has the character of being one of the most active and efficient clergymen of the established church in Ireland.

Francis, the subject of the present notice, commenced his education under his father, at Fermoy, and continued it in the classical and mathematical school of the Belfast Institution, then presided over by Dr. James Thomson, afterwards professor of mathematics in the University of Glasgow. In the month of November, 1822, he entered the collegiate department of the institution, and attended the Logic and Belles Lettres, and the Greek and Latin classes during the winter session. But in May, 1823, he expressed a desire to be a merchant, and it was finally arranged that he should be articled for five years to the house of John Martin and Co., previously to which, however, he had three or four months' initiation into business habits in the office of his father's friend, Samuel Bruce, Esq., notary public and agent. The period for which he was articled terminated in October, 1828, but he continued with the firm until the beginning of 1830, when he sailed to the West Indies as supercargo of one of Messrs. Martin and Co.'s vessels. He visited Jamaica, Barbadoes, Trinidad, and Demerara, but not meeting with an inducement to settle in any of these colonies, he agreed to accompany a Canadian gentleman, whom he met at Barbadoes, to Canada, and proceeded to Montreal and Toronto, his object being to ascertain the nature of Canadian commerce and business. Having gleaned the information he desired, he returned to Belfast in 1831. In the following summer, having determined to settle in Canada, he married the second daughter of Alexander Stewart, Esq., linen merchant of Belfast; and soon after sailed to New York, and proceeded to Toronto, where he became the tenant of a house and store belonging to and adjoining the office and residence of Mr. Baldwin, who had emigrated from Cork several years previously. From him Mr. and Mrs. Hincks and their youthful family received attentions and services, of which Mr. Hincks often speaks with grateful recollection. He soon obtained a high reputation for knowledge of business, and when Mr. Mackenzie attacked Mr. Merritt and others, respecting the Welland canal, and obtained a parliamentary investigation, he was chosen, with another merchant, to examine the accounts. He was also appointed secretary to a Mutual Insurance Company, and cashier to a new Banking Company.

On the appointment of Lord Durham to the government of Canada, Mr. Hincks commenced the *Examiner* newspaper, in the editorship of which he displayed such remarkable vigour and talent that he was invited to become a candidate for the representation of the county of Oxford in the first parliament held after the union of the Upper and Lower provinces. The election was held in March, 1841, when Mr. Hincks was returned by a majority of thirty-one over his opponent, a gentleman named Carroll. Shortly after his election, he was appointed by Sir Charles Bagot, Inspector-General of Finances, and was obliged in consequence to vacate his seat, and

return for re-election. He was opposed by John Armstrong, Esq., who abandoned the contest at noon on the third day, Mr. Hincks having a majority of 218. When Lord Metcalfe dissolved the Canadian parliament in 1844, Mr. Hincks was defeated, his opponents being Robert Riddell, Esq., who was returned by a majority of twenty over Mr. Hincks, and the Hon. Thomas Parke, who did not go to the poll. In 1848, however, he was again elected by the large majority of 335 over his old opponent, Mr. Carroll. Having for the second time accepted the office of Inspector-General of Finances, under the administration of his first friend in Canada, he was re-elected without opposition.

Upon the reconstruction of the ministry, consequent on the retirement of Mr. Baldwin, owing to his impaired health, Mr. Hincks was, through the strong expression

THE HON. FRANCIS HINCKS.

of public opinion, named prime-minister by the Governor-General; and he has since continued to fill that post with distinguished honour, and with the confidence and respect of all the good men of every political denomination in Canada. Nor is this a higher meed than he deserves; for it is mainly to his financial ability, his enlarged views as a politician, his great practical knowledge of what is conducive to the material interests of Canada, and his tact and experience as a parliamentary debater, that the province occupies its present position, and has before it the brilliant prospects that are constantly opening up.

When Mr. Hincks visited England in 1852, he had the honour of being presented to the Queen, who received him with much courtesy.

On his return to Canada, he was elected to represent the county of Oxford for the fifth time, by a majority of seventy-nine over his opponent, John G. Vansittart, Esq. Mr. Shenston, clerk and census commissioner of the county of Oxford, has, in his "Oxford Gazetteer," borne powerful testimony to the value of Mr. Hincks's patriotic and praiseworthy exertions. In dedicating his useful work to that gentleman, he says:—"I find that the first municipal act, giving to the people great powers; the amendment of it, whereby these powers were greatly increased; the establishment of township councils; the new election law, whereby a poll is opened in each township; the amendment to the election act, whereby sheriffs are *ex-officio* returning officers, and township clerks *ex-officio* deputy returning officers; the division court act, the new assessment act, the new jury act, the new post-office act, and cheap postage, all of them date their existence from the time of your first election to represent this county, and in all of them your masterly hand is unmistakeably discerned. In addition to these inestimable and invaluable blessings, enjoyed, in common with us of this county, by the whole province, I may add that, although the Great Western Railroad and the London and Hamilton Plank and Gravel Road had long been in contemplation, and repeated unsuccessful attempts had been made to forward them before your election, it required your information, energy, and perseverance to complete the one, and place the other in its present prosperous and promising condition." It was he, too, who first appreciated the necessity of a great system of railways throughout the province; and it is to him that the credit of the Grand Trunk Railway of Canada, in its present extended proportions, is due. Happy, indeed, would every colony of Britain be, if its councils were directed by a minister as patriotic and as enlightened as Francis Hincks!

A VISIT TO PORTSMOUTH.

AFTER an interval of about forty years, Portsmouth has again become a place of peculiar interest, and the scene of great activity. In this vast naval arsenal may be seen at the moment in which we write no fewer than seventeen first-rate line-of-battle ships, with about as many frigates and steamers, all in commission and ready to proceed to sea at a few hours' notice; not to mention the very many ships laid up in ordinary in the harbour, which could also be got ready for sea in an incredibly short space of time. This fortified town is surrounded on every side by bastions, batteries, ravelins, redoubts, and other dreadful-looking preparations for battle and slaughter, of which, in our peaceable nature, we confess ourselves in happy ignorance, even of their names. It is also a place interesting in the highest degree to the archæologist, from the antiquity of these fortications, which Leland, in his "Itinerary," informs us were "began in the time of Edward IV., and set forward in building them by Richard III.; and Henry VII. ended them, at the procuration of the Bishop of Winchester." It is interesting to the tourist from the very singularity of the town itself, no less than from its being the port from which he can most conveniently embark for one of the most beautiful spots in England—the Isle of Wight—distant only about four miles from Portsmouth; interesting also to the man of science, from the manufactures carried on there, some of which we are about to describe. Let not the reader, however, fancy from what we have just said about its manufactures, that Portsmouth in any way resembles Manchester, that great emporium of peaceful calico and utilitarian cotton prints. Nor is it in the least like Birmingham, where the more sanguinary cutlasses and death-dealing Minié-rifles are constructed. Portsmouth exports no staple products like the steel of Sheffield or the ribbons of Coventry. The manufactures of which we have spoken are confined to two great establishments, both of which belong exclusively to, and produce articles exclusively for, the use of the Royal Navy. These two establishments, however—the Dock Yard and the Royal Clarence Victualling Yard—exhibit features of such interest, and we doubt not to many of our readers novelty, that we feel convinced that a few remarks descriptive of them will not be unacceptable.

But first for the town itself. The one great feature that must of necessity first strike the notice of every visitor to Portsmouth, is the series of fortifications which surround it. Now, as we have said before, we are thoroughly unacquainted with all relating to warlike matters. Still, to attempt a description of Portsmouth without including these, would be to realise the often-quoted, but we suspect fabulous, story of the country theatre playing Hamlet with the character of the Prince omitted. And, perhaps, after all, this very ignorance may be somewhat in our favour. Writing as we do to convey our own impressions of the place to our readers, most of whom, we presume, know as little and wish to know as little of the art of war as we ourselves do; we are not at all sure that these impressions made on us by Portsmouth will not be as acceptable as if a brigadier-general (whatever that may be), fresh from the barracks, were to sit down and describe at length the height, advantages, capabilities, and situation of every single bastion, battery, ravelin, redoubt, etc., as aforesaid.

PORTSMOUTH HARBOUR.

Of the antiquity of these fortifications we have already spoken. Queen Elizabeth, we are told, greatly increased and extended them, "and fortified it (the town of Portsmouth) so stronglee," says the contemporary historian from whom we copy, "that nothing is wanting to make it a place of greate strengthe; some of the garrison mount guarde day and night at the gates; others in the steeple, who by stroke of a bell giveth notice what numbers of horse and foot are approaching, and by a flag, which way they come." Charles II. and James

II. both added to the fortifications, and William III. completed them almost in the state in which they now stand. The lines of fortification round Portsea, a town which adjoins Portsmouth, and in which the docks are situated, were not commenced until 1770, and were only finished in 1809. But enough of their history. The reader will, doubtless, by this time be anxious for some sort of a description of them.

Imagine, then, a long series of massive stone walls facing about at every conceivable angle, and of heights varying from ten to twenty feet. Imagine these walls to have behind them and above them a solid mass of earth proof against cannon-balls. Suppose this earth-work pierced through at every few yards with openings just large enough to allow a most alarming-looking cannon to peep through upon the plains below, or else upon the sea, where, perhaps, the greatest number of them look out. Then imagine the whole of this stone-work, earth, cannon, and all, surrounded by a wide moat, or ditch, some twenty feet deep, generally dry, all but a small channel in the middle which is deeper; but capable of being completely flooded in a few minutes with water enough to swallow up a host. Imagine, we say, all this; and then you will have a tolerable idea of what are called the Portsmouth "lines." In addition to these, there are no end of seemingly indestructible stone buildings, all literally "bristling with cannon." Of these the principal are the Saluting Platform, so called from its guns being used for saluting the Queen, or any other personage of great dignity, when passing; but capable, in case an enemy should unhappily ever approach our shores, of doing most murderous damage; Southsea Castle, a fortress of stone, commanding Spithead and all the sea around outside the harbour, originally built by Henry VIII., and used as a state prison in the reign of Charles II.; Blockhouse Fort, situated upon a point of land running right out into the sea opposite to the town of Portsmouth, at the very entrance of the harbour; and a very ancient Round Tower at Point Battery, opposite Blockhouse Fort, where there was formerly a corresponding tower. Between these two towers, we are told by Leland, "a mighty chaine of yron" was stretched across the mouth of the harbour every night. The remains of the capstan for effecting this may still be seen, and we are informed that part of the "mighty chaine" itself is visible upon the beach at low water. The Round Tower is now, however, entirely appropriated to a powerful battery, having been made considerably higher within the last few years. Another battery stands upon the site formerly occupied by the old Semaphore telegraph, now superseded by the electric wires. Several other batteries might be mentioned; but it not being part of our plan to give anything like a list, we will proceed.

Our impressions on first beholding the fortifications of Portsmouth were singular. The first idea, we must confess, was something very like a feeling of alarm. Peaceful Londoners as we were, we could not but tremble to see, whichever way we turned, a cannon presented point-blank at us, and then, turning again to escape it, to see another, and again another! No escape from them, go where we would, like a haunted man in a melodrama. Cannon before us, behind us, and on every side of us; pointed at us from every conceivable angle; so much so, that we have always felt thoroughly convinced that, should they ever be fired in good earnest, some of them must of necessity shoot exactly into each others' mouths! It was, to say the least of it, something we were not accustomed to. Then we were struck by those funny litttle gateways (like juvenile Temple-bars), with drawbridges attached, which we met with all over the town; and those still more funny and still smaller arched passages underneath the "lines," some of which led into the high road, others into different odd nooks of fortifications, possibly "redoubts" or "ravelins." Then we were shown two more gates (if possible, even more funny-looking still), leading out directly into the sea. These, we were told, were "sally-ports;" and we immediately set it down (much to the disgust of our friend who pointed them out) that they had been so called after a belle of Portsmouth of the name of Sarah.

After awhile we take a boat, and now we are on our way down the harbour. All round us we see objects in the highest degree worthy of notice — the Royal Clarence Victualling Yard; Haslar Hospital, for invalid sailors and marines; and large red brick buildings, seemingly without any mode of ingress or egress—no windows, doors, or even chimneys to be seen;—these are powder-magazines. Then we see the "Royal George" yacht, built for George IV. at a cost of £100,000. We pass the "Victory," renowned as the ship in which Nelson fought and fell—one of the chief lions of Portsmouth; and right before us lies the town itself. But stop; it is a beautiful morning, and we have yet a few minutes to spare. The reader may never have been on board a man-of-war: let us then have a look over the "Victory." What say you, reader? You consent? Very well. Waterman! put the boat about. We won't land yet. Just run us alongside the "Victory." "Aye, aye, sir;" and here we are, our pigmy boat grating against the wooden mountain that rises high above us. Reader, if you have never seen a man-of-war, here is a novel sight indeed. What first strikes you is, doubtless, the immense size of every part of her. The main-mast of a first-rate man-of-war, when ready for sea, with the top-mast and top-gallant-mast affixed to it, measures 212 feet high, somewhere about the height of the monument of London! while the yards, those seemingly small rods of wood stretching across the mast, are some of them upwards of 100 feet long! And everything is in proportion. The interior of the vessel resembles a small town—deck above deck, between each of which is seen a long perspective, which, to the unaccustomed eye, is difficult to measure. The immense cable by which the ship is moored looks strong enough to hold the entire world together, should gravitation cease, and this mighty chain be bound round the globe. The foot of each of the gigantic masts passing through the decks is bigger than a large—a very large, sugar hogshead. And then mark the regularity on board. A place for everything, and everything in its place, is literally carried out on board a man-of-war. Here is the carpenter's store, there the rigging-store, the armoury, the purser's store—all order, no confusion. Then you see the immense guns, each thrust through a port-hole in the vessel's side. Should you hear them fired—and we did—hold your ears! It was only a salute we heard—one single gun fired at a time, and that with a blank cartridge. But oh, such a report—heard as it was in the low space between the decks! What, then, must be the effect of a broadside from some fifty of these guns at once! The spot where Nelson fell is marked by a brass plate upon the quarter-deck, and where he died after having been carried below is also indicated. These two spots are held in the greatest reverence by the sailors.

We were shown the chain-pumps, capable of discharging a ton of water every minute. These pumps, which are used for emptying the ship of water should she spring a leak, are worked by the crew by long crank handles. They consist of a series of pistons fixed upon an endless chain of iron, and working in a cylinder. Working thus with a continuous motion, there are no piston-valves as in reciprocating action pumps, but the water is drawn up in one continued stream.

There are the mess-tables for the crew; the galley-fire for cooking; the officers' cabins; and the ward-room for the superior officers' use; all strange and interesting to the landsman; while down below, in the very bottom of the vessel (called the "hold"), are shown the tanks in which fresh water is carried out to sea. The rigging it would be impossible to describe. Such a tangled mass of cordage as it seems—and yet every rope has its distinct office. Some for shifting the sails, some for hoisting signals, others for supporting the different masts, etc.

But we must now take leave of her. We have done our best to point out to our readers some of the principal objects of interest on board—so, casting a lingering look behind, we get once more into our boat—and again and again, as we proceed onwards, looking back at the beautiful outline of the vessel when seen from a distance sufficient to take in the whole at a glance, we ultimately arrive once more at the town of Portsmouth.

THE FUNGUS TRIBE

CHAPTER III.

We have before stated that the greater number of esculent fungi belong to the tribe *Pileati*, under which head are classed the divisions *Agaricus*, *Boletus*, *Hydnum*, *Polyporus*, *Fistulina*, *Cantharellus*, and several other genera, all of which furnish more or fewer edible species. Of these, however, we find the most under the head *Agaricus*, a division which takes its name from Agaria, a kingdom of Sarmatia. Our English word mushroom (by which all kinds of edible fungi are commonly designated) has a French origin, and comes from the word *mouceron*, "originally," says Badham, "spelled *mousseron;* and belongs of right to that most dainty of funguses, the *Agaricus prunulus*, which grows amidst tender herbage and *moss*, whence its name." *Champignon* is also of French derivation; but whilst that name in France is *generic*, the English make it *specific*, and restrict it to a single species, the *A. oreades*, or "fairy-ring mushroom," of which more hereafter. *Agaricus prunulus* has also a right to the cognomen "fairy-ring mushroom," for it, as well as *A. oreades*, *A. orcella*, *A. Georgii*, *A. personatus*, and our common mushroom, *A. campestris*, has a share in making those mystic rings which in former days scared many a rural hind and maiden, and caused them to deviate from their direct course in passing through the fields where they were to be seen, lest, if they once entered that magic boundary, they should come under the power of the fairies, or (as they were called in Devonshire) *pixies*, and should be by them *pixy-led;* that is, led off into bye-ways, and so into some pathless waste. As Puck says:—

> "I'll follow you, I'll lead you about a round.
> Sometimes a horse I'll be; sometimes a hound,
> A hog, a headless bear; sometimes a fire;
> And neigh, and grunt, and bark, and roar and burn,
> Like horse, hound, hog, bear, fire, at every turn."

So did these poor country-people fancy the fairies would hobgoblinise them, if once they dared to trespass on their domain.

We will not here enter into the speculations of botanists on the mode by which these rings are formed; it will be enough to say, that it is now generally acknowledged that they are produced by the growth of fungi. The *A. prunulus* is reproduced in these rings every year about the same time, the circle continuing to enlarge until it breaks up into irregular lines, which is a sure indication that the species is about to disappear from that place; an unbroken ring being a certain promise of a good crop the next year. It is a large fungus, and very abundant; Dr. Badham says he has collected in one field from twenty to twenty-five pounds weight. Professor Balbi writes to Persoon: "This rare and most delicious Agaric, the *mouceron* of Bulliard, and the *A. prunulus* of other authors, abounds on the hills above the valley of Stafora, near Bobbio, where it is called *Spinaroli*, and is in great request. The country-people eat it fresh in a variety of ways, or they dry and sell it for from twelve to sixteen francs a pound." It is a thick, convex, fleshy mushroom, irregular in shape, of a cream-coloured, or buffish, or gray, or reddish tint, with very numerous white gills, and has the advantage of appearing in spring, when few other edible species are to be procured. In Rome "it is sent in little baskets as presents to patrons, fees to medical men, and bribes to Roman lawyers." How surprised would our learned functionaries in law or physic be to receive a little basket of what they would probably call "toadstools," in return for their efforts on behalf of their clients or patients!

A. Georgii, another of these gregarious ring-forming species, is one of no small interest; its cap is at first conico-campanulate, and covered with white shreds; but when fully expanded these have all disappeared, and it becomes beautifully white and shining. It grows in pastures, and under trees, and some of the individuals attain a most enormous size. Dr. Withering says: "Mr. Stackhouse had repeatedly mentioned to me a large esculent fungus found on the sea-coast in Cornwall, which is, I believe, a monstrous variety of this species. Its whole habit is very large, the button as big as a potato, the expanded pileus eighteen inches over; the stem as thick as a man's wrist," etc. He also mentions a specimen found on an old hot-bed, which weighed fourteen pounds. But huge as this fungus must have been, it by no means equals one mentioned by Clusius in his "History of Plants," which was found in Pannonia. This immense specimen (supposed to have been *Polyporus frondosus*), "after satisfying the cravings of a large Mycophilous household, enough of it remained to fill a chariot!"

The Hungarians suppose the Agaric, *A. Georgii*, or as some authors call it, *A. exquisitus*, to be a special gift from St. George. It has several trivial names—"the Horse-mushroom," from its immense size; and "White caps," under which name it is sold for making ketchup. There are so many other interesting species of *Agarics* which invite our attention, that it is difficult to know which of them to select for especial notice. We have named *A. oreades*, and *A. personatus*, as being species which grow in rings. The former is a small buff mushroom, its common names being "Champignon," and "Scotch-bonnets." It is very common, according to Badham; Hyde-park produces them abundantly in some seasons. He says, that in the French *à-la-mode* beef-shops, this species of fungus is in great request, and that it imparts a delicious flavour to rich soups and gravies. When dried (as it is the custom of the French and Italians to use them), these champignons may be kept for many years, and their flavour becomes improved by the process. *A. personatus* is sold in Covent-garden Market, under the name of "Blewits." It is of a pale bistre, or purple lilac, occasionally violet, the cap from two to six inches broad, and the stem from one to three inches high. It grows in rings or in clusters amongst grass, usually appearing in October.

Our cut No. 1 represents *Agaricus comatus*, according to Puccinelli, as quoted by Badham, "in great repute about Via Reggio and Lucca." It may be found in meadows and waste places in early spring, and the young specimens are used for making ketchup. It is called "the *maned* agaric," from its shaggy edge. The cap is fleshy, white, and scaly, the lamellæ or gills changing to red-purple and to black, and showing their dark hue through the skin of the cap as it advances in age.

No. 2 is of a species which grows on wood—*Agaricus ostreatus*. It may be found on dead trees in spring and autumn. This fungus varies much in size and colour; but where it has once been found, there it is pretty sure to grow for many successive years. It is a pretty fungus, varying in hue; but though occasionally found quite white, it is in general of a cinereous brown with white gills, and has either no stem, or one sub-lateral.

A. rubescens (fig. 3), is another very delicate Agaric which grows in woods, particularly of oak or chesnut, and is found both in summer and autumn; and *A. caudicinus* (fig. 4), a beautiful little cinnamon-coloured fungus, which grows on trees, and is very much prized in Southern Italy, is also worthy of our notice; the elegant little white field Agaric, *A. Virgineus*, which abounds in our pastures in autumn, is also a very attractive species. But space does not allow of our naming any others of this tribe, and we can barely hint at the rich store of food which is offered to us by the other genera of the tribe *Pileati*.

The genus *Boletus* differs from the *Agarics* in having, instead of *gills*, a series of vertical tubes, aggregated under the cap and encircling the stem, which look, when seen altogether, like a slice of fine sponge. *B. edulis* and *B. scaber* are the species most in vogue, though several others are innocuous and agreeable. *B. edulis* is a huge fungus from six to seven inches across; it varies in colour from light brown to bronze, bay, deep brown, etc. The tubes are at first white, then yellow, lastly, of an olive or yellow-green. The stem is always thick and solid; at first white, but changing to fawn

colour; and it is beautifully mapped or meshed with reticulations peculiar to itself. This species seems to have been well known to the ancient Romans, and appears to have been that called *Suillus*. "As to the best manner of cooking *B. edulis*, this must be left to the taste of the gourmand; in every way it is good. Its tender and juicy flesh, its delicate and sapid flavour, render it equally acceptable to the plain and to the accomplished cook. It imparts a relish alike to the homely hash and the dainty ragout; and may be truly said to improve

FIG. 1.—AGARICUS COMATUS (THE MANED AGARIC).

every dish of which it is a constituent." So says Dr. Badham, and he is backed by other authorities, who agree in stating *B. edulis* to be (as its name implies) very excellent eating.

The *Hydnum* is another genus of this tribe, which affords good food. Our figure 5 represents *H. repandum*, a tawny red species, which occurs in woods of oak and pine, growing frequently with others. This is the only esculent species in the genus *Hydnum*, and is said to have a flavour of oysters.

In this genus the under surface of the cap presents a series o conical teeth or bristles. For this reason *Hydnum repandum* is called in Italy *Steccherino*, or "the hedgehog."

The genus *Fistulina* presents us with but one edible species *F. hepatica*. This is that strange-looking fungus which resembles in its early stages a huge red tongue, lapped out a us from the trunk of some oak or chesnut, far above ou heads; whence its vulgar name in Italy is *Lingua quercina*, o *Lingua di castagna*. In its later growth, it looks more like

FIG. 2.—AGARICUS OSTREATUS (THE OYSTER).

FIG. 3.—AGARICUS RUBESCENS.

lump of dark liver than any other substance, whence its specific name. One individual of this species is said to have weighed nearly thirty pounds, and another is mentioned as nearly five feet in girth, and weighing above thirty pounds. "No fungus yields a richer gravy," says Badham, "and though rather tough, when grilled it is scarcely to be distinguished from broiled meat."

We must now turn to the second tribe into which ou

order is divided, the *Clavati*. This, which furnishes a vast variety of our most interesting fungi, supplies, nevertheless, but one genus which contains any edible species. This genus is *Clavaria*, and all its species are esculent. They are called *Clavaria* from their simple clavate form. The whole genus is exceedingly pretty; some of them growing on trees, others clustering amongst grass. *C. rugosa* is of ivory smoothness and of the purest white. It grows from two to two and a half inches high, is simply branched, but each branch is curved. It grows in clusters, and gives you an instant

reminder of a handful of the convoluted kernels of walnuts after they have been delicately peeled for eating. Another yellow species grows widely amongst grass, so as to quite yellow the surface of the place on which it has taken up its abode. We have seen on a hill at Tor, near Torquay, acres of ground on which you could not walk many yards without treading on clustered masses of this pretty pale yellow *Clavaria*, which smells (as does its white congener, *C. rugosa*) so purely mushroom-like, that you cannot doubt of its good qualities. *C. coralloides* (fig. 6), pronounced by Vittadini, *esculenta deliciosa*, is erect, white, with unequal branches tipped with red or violet; and *C. amethystina* (fig. 7) of a most delicate lemon colour. The mode of dressing fungi of this genus is to cleanse them well from earth, which is apt to adhere to them, then *sweat* them with a little butter over a clear fire and strain them, throwing away the liquor. After this you must stew them for an hour with salt, pepper, chopped chives, and parsley, moistening with a little plain broth, and dredging occasionally with flour; when cooked, to be thickened with cream, and yolks of eggs.

The third tribe, *Mitrati*, ranks under its banners two genera which produce excellent food. The first of these, *Helvella*, gives us two edible species—*H. crispa* and *H. lacunosa*. They grow on earth or on very wet wood, and emit an agreeable odour. Though of a permanent character, they are rather fragile, and much like the morel in flavour, being in Sweden and Germany often confounded with it. In Sweden it is called *Stenmuchla;* in Germany, *Gemeine Morchel*, *Stumpf Morchel*, or "Stock Morchel."

The other esculent species of this genus is *Morchella*, which also affords two most delicious edible species—*M. esculenta* and *M. semilibera*. These, especially the former, are the most eagerly sought for, and the most highly-prized of any amongst the esculent fungi. Badham speaks of the *Morchella esculenta* as "that expensive luxury which the rich are content to procure at a great cost from our Italian warehouses, and the poor are fain to do without." *M. semilibera* is the other of these excellent species; but though very fine, it is inferior to *M. esculenta*.

The morel is found in greatest abundance where trees have been cut down, "which," says Loudon, "led to the practice in Germany of burning down masses of forests for the sake of the future morels. This practice proved so injurious, that it became necessary to suppress it by law." The appearance of the *Morchella* is very singular. Its cap varies considerably in shape and hue, and the surface is pitted into little cells, or pockets, formed by folds or plaits of the hymenium, which are called *ribs*. These ribs are very irregular. The cap is hollow, and opens into an irregular hollow stem. Gerard seems not to have been in the least degree aware of the real character of the morel, which would lead to the supposition that its use as an article of food, and its value as a culinary delicacy, were unknown at the period when he wrote. He gives a very correct drawing of *M. esculenta*, under the name of *Fungus fanaginosus*, or "the Hony-combe Mushroom," and says: "There is likewise a kind of mushroom called *Fungus fanaginosus*, growing up in moist and shadowie woods, which is also venomous; having a thicke and tuberous stalk, an handfull high, of a duskish colour, the top whereof is compact of many small divisions like unto the hony-combe."

The *Lycoperdons* next demand our attention. "All those more or less spherical white funguses, furnished with a membraneous white covering, and filled, when young, with a white, compact, homogeneous pulp, which we call puff-balls, are good to eat:" so writes Dr. Badham; and he adds, that those in most request abroad, and the best, are those which have no stem—that is, no sterile base.

Two species, *Lycoperdon plumbeum* (fig. 8) and *L. bovista*, are quoted as the best eating. The former of these may be found, either solitary or in groups, in dry places, and may be gathered in spring, summer, or autumn. Vittudini says: "After the warm rains of summer and autumn, myriads of these little plants suddenly springing up will often completely cover a piece of ground as if they had been sown like grain for a crop. If we dig them up we shall find that they are connected with long fragile threads, extending horizontally under ground, and giving attachment to numerous smaller puff-balls, in different stages of development, which, by continuing to grow, afford fresh supplies as the old ones die off." *L. plumbeum* is, when full grown, about the size of a walnut. Loudon figures it under the name of *L. pyriforme*—"the pear-shaped puff-ball." The other species named as among the best is *L. bovista*. This is the kind which is used for the purpose of throwing bees into a trance whilst the spoilers rifle their home of all its hoarded treasure. It used also, in former days, to be employed instead of lucifer matches, as it will, when dry, hold fire for a long time, and was often carried by rustics in a state of ignition for the purpose of lighting their cottage fires. *L. bovista* sometimes grows to an enormous size. The flesh is at first of snowy whiteness, but it should be eaten as soon as gathered, a few hours sufficing to turn it to dirty yellow, and destroying its firmness. When fresh, its thick, white fleshy substance renders it fit for all culinary purposes. The best method of dressing it is said to be, to cut it in slices, and fry it in egg and bread-crumb. According to Vittudini, you may cut slices daily fresh from the living plant (provided that you do not break its connexions with the earth), and so have "a fine frittura every day for a week," which "frittura" Badham reports to "have the flavour of a rich light omelette."

One more noted species, the *Tuber cibarium*, or truffle, must close our imperfect catalogue of edible fungi. This curious species is found growing in clusters in clayey or sandy soil, some inches under the ground, as also in chalk; and is common on the Wiltshire downs, as well as in woods both in England and Scotland. The form of truffles is nearly spherical, and their colour approaching black; they are studded over with pyramidal tubercles, and their spawn is phosphorescent and emits light. In England they seldom exceed a few ounces in weight, but on the Continent they are said to attain to many pounds weight. As there is no appearance above ground to indicate where the truffles lie, there is, of course, difficulty in discovering them; but so keen have men been in their appetite for this delicacy, that they have hit on the expedient of training dogs to scent them out. When the animals nose the prey, they stand, and whine, and scratch on the spot until their masters dig and take possession of the tubers. It is said that a *man* was once known capable of exercising this extraordinary function, and discovering truffles in the earth by their scent.

In the preceding pages we have not sought to give such a description of any species of the esculent fungi as might lead our general readers to endeavour to discriminate for themselves which, amongst the various members of this extensive tribe, may be considered as a part of God's great gift of wholesome food for man, and which of them are possessed of deleterious or poisonous properties. Such an attempt on the part of those unused to such studies might be fraught with danger; because, although by no means of the mind of Tertullian, who wittily says of this order—

"Quot colores, tot dolores: quot species, tot pernicies;"

yet we are well aware that there are but too many of the species which are of an unsafe character, that might, on a mere cursory survey, be gathered and eaten in mistake for those which, bearing a near resemblance, were yet of wholly different properties, and perfectly safe and good for food. Our wish has been, and is, to draw the attention of the intelligent to the subject, and to endeavour to excite those who have time and opportunity to make some attempt to rescue this vast supply of food from the desuetude to which it is at present sentenced. Surely, what God in his goodness bountifully provides, man should not wilfully neglect to use; and when a few weeks of study would enable a man of intelligence to place within the reach of his poorer neighbour a supply of food which, from his ignorance of its properties, he is at present withheld from using, it would not be time thrown away if he were to devote to the subject that portion of time and thought which is necessary to make him a safe judge of the properties of the different species of fungus which grow in the fields and woods around his dwelling.

PEERS AND M.P.'S;

OR,

LORDS AND COMMONS.

SCENES IN PARLIAMENT.

THE dull light of a January day was changing into dark, when a loud knock was heard at the door of the house, and a rush, as of many armed men. Accompanied by his nephew and the prince palatine, Charles the First entered the house, darting, as Rushworth tells us, a look on the right hand, near the bar of the house, where Mr. Pym used to sit; but not seeing him there (*wishing him well*), went up to the chair. "In vain the royal eye sought Pym, Hampden, Hollis, Hazelrigge, and Stroude; they had received a hint of the coming danger, and were hiding in safety in Coleman-street. Charles then angrily addressed the members. The time soon came when he had to speak to them in very different manner. The birds were flown, but they were to be caught, and sent to him with all due celerity: such was the royal will. After this, his Majesty asked Lenthall the speaker, whether any of the five were in the house? To which," says Rushworth—the only quiet and unmoved person in that eventful scene—"to which the Speaker, falling on his knee, thus answered:—'May it please your Majesty, I have neither eyes to see nor tongue to speak in this place, but as the house is pleased to direct me, whose servant I am here; and humbly beg your Majesty's pardon, that I cannot give any other answer than this to what your Majesty is pleased to demand of me.' The king, having concluded his speech, went out of the house again, which was in great disorder; and many members cried out aloud, as he might hear them, '*Privilege! privilege!*'"

It is April, 1653, and again the house suffers a rude, and this time a victorious, surprise. A veritable king among men now appears upon the stage. In plain black clothes, with gray worsted stockings, Cromwell made his appearance.

"Vane, young in years, but in sage council old,"

was on his legs. After a few minutes, Cromwell beckoned Harrison: "Now is the time," he said; "I must do it." Harrison, doubtful, advised him to consider, adding, "the work is great and dangerous." "You say well," retorted Cromwell hastily, and sat still for another quarter of an hour. The question was now about to be put, when Cromwell suddenly rose, took off his hat, and spoke. At first and for a good while he spoke to the commendation of parliament, for their pains and care of the public good; but afterwards he changed his style, told them of their injustice, and at last indulged in a torrent of invective. Vane rose to remonstrate. Cromwell stopped and said: "You think that this is not parliamentary language: I know it." Then he put on his hat, went out of his place, and walked up and down the stage or floor in the midst of the house with his hat on his head, and chid them soundly, looking sometimes and pointing particularly upon some persons, as Sir R. Whitelake, one of the commissioners for the great seal, and Sir H. Vane, to whom he gave very sharp language. Though he named them not yet by his gestures, it was well known he meant them. All this he spoke, says Ludlow, with so much passion as if he had been distracted. When Vance, and Marten, and Sir Peter Wentworth tried to speak, Cromwell cried out, "Come, come, I'll put an end to your prating. You are no parliament; I'll put an end to your sitting. Begone—give way to honester men!" Cromwell then made a signal, which was understood by the soldiers outside, who, with arms ready, immediately rushed into the house. Pointing to the Speaker in the chair, Cromwell said, "Fetch him down." The Speaker refused to move. We take the remainder from the graphic account of Mr. Foster. "Take him down," said the general. Then Harrison went and pulled the Speaker by the gown, and he came down. It happened that that day Algernon Sidney sat next to the Speaker on the right hand. The general said to Harrison, "Put him out." Harrison spoke to Sidney to go out, but he said he would not go out, and sat still. The general said again, "Put him out." Then Harrison and Worsley, who commanded the general's own regiment of foot, put their hands upon Sidney's shoulders, as if they would force him to go out. Then he rose and went towards the door. Then the general went to the table where the mace lay which used to be carried before the speaker, and said, "Take away these baubles." So the soldiers took away the mace. One by one the members left the house. As they passed Cromwell, he addressed the leading men with passionate bitterness. He accused Alderman Allen of embezzlement, and Whitelake of gross injustice. He pointed to Challoner, and told his soldiers he was a drunkard; he called after Sir Peter Wentworth that he was an adulterer; and as his old friend Henry Marten passed, asked him if a whoremonger was fit to sit and govern. Vane passed him among the last, and as he did so said aloud, "This is not honest. Yea, it is against morality and common honesty." Cromwell then addressed him thus: "Sir Harry Vane! Sir Harry Vane! The Lord deliver me from Sir Harry Vane!" Cromwell's end was now gained—he was the master. He locked the doors and went away to Whitehall.

Then we come to the short parliament which met in the council chamber in Whitehall, on the 4th of July, 1653. The manner of their proceeding is thus recorded:—"After Cromwell had harangued the new members at Whitehall, and invested them with the supreme authority of the nation, they resolved to meet at the old Parliament House the next day. Accordingly, about eight in the morning many of them assembled there, when they began by seeking God with prayer, and the Lord did so draw forth the hearts of them that they did not find any necessity to call for the help of a minister." The account goes on to state, "that much of the presence of Christ and his Spirit appeared at that time to the great gladdening of the hearts of many; some affirming they never enjoyed so much of the spirit and presence of Christ in any of their meetings and exercises of religion in all their lives as they did that day." This was when they met for the choice of a Speaker. What would the world think were such a summary to appear in the *Times* or the *Daily News?* Happily, however, the nation has not become less religious; it has only become more enlightened—more convinced of the fact, that the forms of religion do not necessarily imply the existence of the spirit; and that, not unfrequently, the man most destitute of real religion has most of its form. When Mr. Rous went up with the majority of this parliament to resign their authority back into Cromwell's hands, he informed the Protector that some of the members were refractory, and refused their consent. Upon this, Colonel White was sent to clear the house. They had placed one Moyer in the chair by the time the colonel arrived, who being asked by White, what they did there, replied very gravely, that they were seeking the Lord. Then said the Colonel, "you may go elsewhere; for to my certain knowledge the Lord has not been here these many years."

A passage from Echard throws some light upon the manner in which the struggle was carried on between the court of Charles II. on one side, and the House of Commons on the other. "The address was agreed to the day before," says Echard, Nov. 4, 1673; "but the king disappointed all by coming unexpectedly to the House of Lords, and ordering the Commons to attend him. It happened that the Speaker and the usher both met at the door of the House of Commons; and the Speaker being got within the house, some of the members suddenly shut the door, and cried out, 'To the chair! to the chair!' while others cried, 'The Black Rod is at the door!' The Speaker was immediately hurried to the chair, and then it was moved: '1. That our alliance with France was a grievance; 2. That the evil counsellors about the king were a grievance; 3. That the Duke of Lauderdale was a grievance, and not fit to be trusted or employed in any office or place of trust.' To which there was a general cry, 'To the question! to the question!' But the Black Rod knocking earnestly at the door, the Speaker leaped out of the chair, and the house rose in great confusion." This was rapid legislation with a vengeance. Happily, the house has become bolder and more powerful now.

KONIEH.

Konieh is a town of Asiatic Turkey, built on the ruins of Iconium, the capital of Lycaonia. To this city allusion is made both in sacred and profane history. Herodotus, Strabo, Cicero, and Xenophon, make mention of the place; and there St. Paul was persecuted by the unbelieving inhabitants, both Jews and Gentiles. The ancient name signified *image*, and was bestowed, it is said, on account of the head of Medusa being suspended from one of the columns.

After the taking of Nicæa by the crusaders, in 1099, Konieh became the residence of the Seljuk Sultans, by whom it was restored to much of its ancient glory, and embellished with many new buildings. Ninety years afterwards it again changed hands, and the Turks were expelled by Frederick Barbarossa. At his death the city was retaken by the Moslems, and there the Seljuk Sultan lived in great state till the irruption of the Khans. Since the days of Bajazet it has been included in the territory of the Grand Seignior.

Konieh has little to recommend it. The mosques, the coffee-houses, and the Armenian churches, have nothing very attractive in them, except, perhaps, Sultan Selim's mosque, built on the model of that of St. Sophia at Constantinople. Neither is there anything beautiful in the surrounding country—for the most part it lies bleak and bare, an inhospitable district, a dreary, barren plain, edged with snow-covered mountains. But Konieh has still something interesting. Its importance belongs to the past; but the walls reared by the sultans, from the remains of old Iconium, are covered with figures in alto-relievo, which are said to be the finest in all Turkey. The gate represented in our engraving is thus ornamented, and is a very fair specimen of the whole. The winged figures over the gate are supposed by the inhabitants to be the good angel Gabriel, and the fallen spirit Ariel. The key is ornamented with a double-headed eagle. The balls suspended by chains from the upper part of the wall are trophies, common enough among the Mussulmen, of former triumphant victories. The structure altogether is in a very ruinous condition, the sculptures sadly defaced, and the appearance of the gate injured by the Turkish booths which are clustered thickly about it; but there is still enough to attract a visit from the antiquary, and to reward him for his trouble.

THE GATE OF KONIEH.

OLIVER CROMWELL.

OLIVER CROMWELL.

The world at length understands Oliver Cromwell. Every believer in truth, every worshipper of sincerity, must thank Thomas Carlyle for this. He was the first to expose the misrepresentations that have grown and thickened these last two hundred years, and to help mankind to realise what an honest, earnest, God-fearing man this Cromwell was—how he was guiltless of selfishness and ambition; and how, full of faith and love, he laboured for one great end, in the council-chamber or the battle-field.

Cromwell came of good family. His mother had royal blood in her veins. His paternal ancestors sat as barons in parliament so far back as Edward the Second's time. Cromwell himself was born at Huntingdon, in the large Gothic house to which his father's brewery was attached, on the 25th of April, 1599. He was a second son, and the only one of three who lived to manhood. Curious tales are told of Oliver's childhood. On one occasion, it is said, playing with the future Charles I., he quarrelled with his illustrious playmate, and made the blood flow in copious streams from the prince's nose. On another occasion, he is said to have dreamt that the curtains of his bed were slowly withdrawn by a gigantic female figure, who told him that before his death he would be the greatest man in England. His first years were spent in the Grammar-school of his native town, and he entered Sydney Sussex College, Cambridge, April 23rd, 1616, the very day on which Shakspeare died. Soon after the death of his father, Cromwell proceeded to London, and, according to Noble, was entered at Lincoln's Inn, although the books of all the inns of court have been searched, and there is no mention made of Cromwell in any of them. In August, 1620, Cromwell being then twenty-one years and four months old, we find him married to Elizabeth Bourchier, a kinswoman of the Hampdens. The marriage was celebrated in St. Giles's Church, Cripplegate—the church in which, some fifty years after, Milton's wearied body found repose. Cromwell then returned to Huntingdon, where he threw open the doors of his house to the persecuted nonconformist divines, where many of his children were born, and where he seems to have been active in business as a brewer, and at the same time to have undergone a deep religious change. In the third parliament of Charles I., Cromwell took his seat for Huntingdon. It was a parliament of sober, serious men. Weeping like a girl, old Coke declared Buckingham the author of all the miseries that had fallen upon the nation; but Charles angrily prorogued the parliament. In the next session Cromwell made his first speech. "Dr. Alabaster," he had heard, "had been preaching flat popery at Paul's Cross;" but the matter dropped, as, in another fortnight, parliament was dissolved. In the next eleven years, Charles ruled without parliaments, and Cromwell retired into private life. He removed from Huntingdon to St. Ives, where he remained till the summer or spring of 1638. In that year we find him at Ely. Here he remained till the time of the Long Parliament, draining the fens, while "cousin Hampden" was trying the right of the king to collect ship-money. At length the Long Parliament met, with Cromwell as member for Cambridge. During the first three-and-twenty months we find but few traces of our hero. He was, however, only biding his time, in patience possessing his soul. On Sunday, 23rd of October, 1642, we find Captain Oliver present at Edgehill, and doing his duty, though he had but four tapsters to lead against the enemy. Associations were formed for the protection of the counties against the king's troops; of these the most important was that in the Eastern counties, in which he raised a troop of horse, of which he became colonel. Cromwell was made lieutenant under the Earl of Manchester, and governor of the Isle of Ely, and did good service to the parliamentary cause by his bravery, his determination, and skill. Shortly after we find him at Waisby, near Horncastle, where he had a horse killed under him. This engagement had a startling effect. It revived the parliamentarians. Charles, when he heard of it, was reported to have said, "I would that some one would do me the good fortune to bring Cromwell to me, alive or dead."

Cromwell now had his hands full. Prince Rupert, in 1644, came pouring over the hills from Lancashire with an army of some 20,000 men, and was met by the parliamentary generals at Marston Moor—with what result, the world knows well. But we must pass rapidly along the history of those times—the passing of the self-denying ordinance, Cromwell's expedition in the west, his return to the associated counties, the battle of Naseby, etc. Suffice it to say, war being done with for a time, we find Cromwell in his place in parliament, deep in debate on the further establishment of the Presbyterian government. Meanwhile, after much insincere negotiation on his part, the king escapes from Hampton Court, and is lodged for the present in Carisbrook Castle. In 1646 Cromwell wins the battle of Naseby; and parliament makes him a baron, and settles on him a pension. In 1648 the civil war again breaks out. Cromwell marches into Wales, in May; then to Scotland, in August; and returns to town in a crisis. Members of parliament are sent to the Tower and elsewhere. The minority becomes a majority: that majority did a thing memorable in English history: by it was tried and executed Charles Stuart, King of England. The second civil war being thus terminated, Cromwell left England for Ireland, where Ormond, with his army, is strong for the king. Cromwell's career began at Drogheda, whose garrison, consisting of 3,000 men, he put to the sword. Wexford met with a similar tragic fate. Of a truth, Cromwell was no rose-water quack. At Clonmel he closed his Irish campaign, and returned to England, where, in 1650, he was made Captain-General and Commander-in-Chief of all the parliamentary forces. Immediately he was marching on to Scotland. At Dunbar he defeated David Leslie with an army of upwards of 23,000 men. Next summer he destroyed the hopes of royalty for a time, and thus triumphantly consummated his military career. Henceforth we find him as potent in the council-chamber as in the field of battle. The Rump Parliament had become useless; and thirty-one months after the battle of Worcester it had to be dismissed, and in what manner dismissed it is needless to repeat. This was followed by the Barebones Parliament. After five months of struggling and debating, the members resigned their powers to his excellency, and the parliament dissolved itself. Nothing remained but that Cromwell should be made Protector, which accordingly was done. At this time, says Carlyle, "he stands some five feet ten, or more—a man of strong, solid nature, and dignified, now partly military carriage; the expression of him, valour and devout intelligence—energy and delicacy on a basis of simplicity. Fifty-four years old gone April last; brown hair and moustache, now getting gray. A figure of sufficient impressiveness—not lovely to the man-milliner species, or pretending to be so. Massive structure; big massive head, of somewhat leonine aspect; wart above the right eye-brow; nose of considerable blunt aquiline proportions; strict yet copious lips, full of all tremulous sensibilities, and of all fierceness and rigours; deep loving eyes—call them grave—call them stern, looking from under those craggy lashes as if in life-long sorrow, yet not thinking it sorrow."

Well may Cromwell look sorrowful. Troubles thicken round him. No parliament suits him; and he is surrounded with plots—some royalist, some the reverse—on all sides. He has no peace, no rest; he becomes haggard and weary-worn. On the 6th of August, 1658, Lady Claypole, Cromwell's favourite daughter, died. A few days after, George Fox, the Quaker, meets Oliver in Hampton Court at the head of his guards. "I saw and felt," writes honest George, "a waft of death go forth against him, and when I came to him, he looked like a dead man." Quaker Fox saw but too truly: the conqueror of all England had bowed, in his turn, to a mightier power. A hand, heavier than his own, was on him. On the 3rd of September, Oliver Cromwell died.

RIO JANEIRO.

The city of Rio Janeiro extends some three miles along the south-west side of the bay, and being much intersected by hills, it is difficult to get a good view of the whole range, unless from the top of one of the mountains near the city, such as the celebrated "Corcovado," which stands out like a pulpit on the plain below, and is some 2,500 feet perpendicular. The view from this pulpit on a clear day is superb, and almost unequalled in the world: the city, with its numerous divisions and suburbs below you—the bay, extending as far as the eye can reach until lost in the plain below the Organ Mountain—the sea, studded with numerous picturesque islands, with vessels looking like white specks upon it, and seen to a great distance—all together form a most enchanting picture, and amply repay the toil of an ascent. The mountain is of granite rock, like all others in this country, but thickly wooded almost to the summit, and you come out quite suddenly on the bare point before alluded to, so much resembling a pulpit. The following description, in a publication* containing some of the best word-painting of Brazilian city life any where to be met with, will be readily recognised as most just by all who have been long in the capital:—"The town of Rio Janeiro (its proper name is St. Sebastiano) is the largest and best in South America, and the population about equals that of Liverpool. It is laid out in regular squares: the streets are narrow, which, at first sight, seems objectionable to an Englishman, but he soon finds that it affords protection from the scorching sun; and the thoroughfares are tolerably well paved and lighted, and have *trottoirs* at the sides. To obviate the inconvenience arising from the narrowness of the streets, carriages are only allowed to go one way, up one street and down the next, and a hand is painted up on the corners to show which way the traffic is to flow. The best street, Rua d'Ouvidor, is nearly all French, so that one can almost fancy oneself in the Palais Royal; and nearly everything that is to be found in London or Paris may be bought in Rio. Many English merchants have houses in the city, but most of the shopkeepers are French; and this proves a perfect blessing to visitors, for a Brazilian shopman is so careless and indolent, that he will hardly look for anything in his stores, and will often say he has not got the article asked for, to save himself the trouble of looking for it. The best native shops are those of the silversmiths, who work pretty well, and get a good deal of custom, for Brazilians and blacks revel in ornament, often wearing silver spurs and a silver-hafted knife, though perhaps they may not have any shoes to their feet. The Brazilians are very fond of dress; and though it seems so unsuitable for the climate, wear black trowsers and an evening suit to walk about the streets in. Strangers will find no curiosities in Rio Janeiro except the feather flowers, which are better here than in Madeira, and fetch a higher price. A Frenchwoman, who employs a number of girls of all complexions in her business, is the principal manufacturer. They are made (or ought to be) entirely of undyed feathers, the best being those of a purple, copper, or crimson colour, from the breasts and heads of humming-birds. One of these wreaths has a beautiful effect, and reflects different-coloured light. The wing cases of beetles are also used, and glitter like precious stones. Madame has her patterns from Paris, so the wreaths are generally in good style and newest fashion. The worst shops are kept by English, and this will be found a general rule in these foreign towns. The merchants are good and honest; but if one wishes to be well taken in, go to a shop kept by an Englishman."

In consequence of the tortuous formation of the streets, constructed round the base of the hills, it is difficult to get more than a bird's-eye view of the city, on ground made by encroachment on the sea; consequently, the streets are low, without drainage, and in several of the back ones the water collects and stagnates, to the great detriment of health and comfort. Rio itself is a bad copy of Lisbon—streets at right angles, a large square facing the sea, and the suburbs extending up the hills, which everywhere meet your eye. In Lisbon the streets are tolerably made, but here they have built them so miserably narrow, that scarcely even one carriage can pass through, much less pass each other; and it is evident that such vehicles were never contemplated in the original formation of these streets. The only way of getting over the difficulty is, for carriages coming into the city to take one line of streets, and those leaving it another, which they do, excluding omnibuses altogether from the principal thoroughfares. Improvements in this way are most backward, and there seems a great want of municipal government. In many places the pavement is execrable, and generally very bad, the difficulty having probably been increased by laying down mains for water and gas, the latter now in process of execution, and also by heavy rains, which have washed away many parts of the road, and otherwise caused much damage. When once this troublesome job is got through, it is to be hoped some effective measures will be taken to put the streets and branch-roads in order; otherwise they will soon be rendered impassable. Coach and coach-spring making must be thriving trades here, especially with the immense increase that has taken place in the number of carriages and omnibuses; and it is really wonderful how they stand the continual shocks they have to endure. Mr. Robert Elwes, from whose work we have already quoted, thus writes:—"The inhabitants of Rio Janeiro are fond of carriages, but the specimens generally seen would hardly do for Hyde-park, being chiefly old-fashioned coaches, drawn by four scraggy mules, with a black coachman on the box, and a postillion in jack-boots on the leaders, sitting well back, and with his feet stuck out beyond the mule's shoulders. The liveries are generally gorgeous enough, and there is no lack of gold lace on the cocked hats and coats; but a black slave does not enter into the spirit of the thing, and one footman will have his hat cocked athwartships, the other fore and aft; one will have shoes and stockings, with his toes peeping through, the other will dispense with them altogether. But the old peer rolls on unconscious, and I dare say the whole thing is pronounced a neat turn-out. The Brazilians are great snuff-takers, and always offer their box if the visitor is a welcome guest. It is etiquette to take the offered pinch with the left hand. Rape is the Portuguese for snuff, hence our word 'rappee.' They do not smoke much. The opera was good, the house very large, tolerably lighted, but not so thickly attended as it might be. The ladies look better by candle-light, their great failing being in their complexions, the tint of which may be exactly described by the midshipman's simile of snuff and butter. The orchestra was good, many of the performers being blacks or mulattoes, who are excellent musicians. The African race seem to like music, and generally have a pretty good ear. Both men and women often whistle well, and I have heard the washerwomen at their work whistling polkas with great correctness. I was amused one evening on going out of the opera when it was half over: offering my ticket to a decent-looking man standing near the door, he bowed, but refused it, saying that men with jackets were not allowed in the house."

Government seems at last alive to the absolute necessity of doing something to improve the sanitary condition of the city, and also its internal organisation, as they have lately got out some good practical English engineers, who, we have no doubt, will suggest an effective mode of dealing with present difficulties. If they do not adopt decisive measures, the rate of mortality may be expected to augment fearfully in a dense population of 300,000 to 400,000 inhabitants, huddled together in some 15,000 houses, surrounded by impurities of every kind, not the least being the stagnant water in the streets. No exact

* "A Sketcher's Tour round the World," by Robert Elwes.

census has ever been taken of the population of Rio Janeiro, which, however, is believed to be between the two figures above given. There is a migratory population, but the accumulation of humanity of every race and colour, contained in some of the large dwelling-houses, is something extraordinary. As before observed, nature has done much for this country, and if the natural facilities of Rio Janeiro were properly turned to account, and local improvements carried out with energy and spirit, it might be rendered one of the finest and most luxurious places within the tropics. The opportunity is now open to them; the government possess ample means, and it is just a question whether measures of progress are to be effectively achieved, or the city to be abandoned to its fate. The great evil attending all improvement in Brazil is an undue appreciation of native capability, and a disparagement or distrust of those whose practical experience would enable them to grapple with the difficulties that surround them—a kind of little jealousy and mistrust that prevents them from availing themselves of opportunities thrown in their way to carry out undertakings necessary to the well-being of the country; nor can they understand the principle on which such things are regulated in England, still less the magnitude of operations carried on there and in many other parts of Europe. Yet the time seems to be coming when these principles will be better understood here, and when the application of English capital towards the improvement of the country may be safely and legitimately brought to bear.

Few spots in the New World are more indebted to nature than the environs of Rio Janeiro, all possible combinations of scenery being included in one magnificent perspective. One of the best views is from the Corcovado Mountain, which, although upwards of 3,000 feet in height, can be ascended on horseback. Like most mountains around, it is rather a rock, or titanic monolith, than a mountain, and it may be compared with the gnomon of a gigantic sun-dial: and, in fact, its shadow in particular localities supplies the place of a parish clock. Its sides are still in great part covered with forest and "matta," or jungle, notwithstanding numerous fires by which it has been devastated, and the immediate result of which is a deficiency in the supply of water to parts of the capital; for the destruction of trees here, as elsewhere, causes a scarcity of the aqueous element, and the springs which arise on and around this mountain feed the conduits and aqueducts that convey that fluid into Rio. From the summit may be seen the whole extent of the harbour and city; the Organ Mountains in the distance, several lakes along the coast, a wide expanse of ocean, and innumerable ravines and spurs of the mountain covered with richest foliage. The most remarkable, however, of all the mountains near the capital, is the Gavin, with a flattened summit, sometimes called by the English the Table Mountain, in Portuguese, the "square topsail," to which it bears a resemblance. It is reputed to be inaccessible, at least it has not yet, as far as can be ascertained, been ascended. Opening into the outward harbour is Botafogo Bay (p. 373), a short distance from the capital, where many foreign merchants reside to enjoy the cool sea-breezes, and where the buildings are of a superior description, with beautiful gardens attached, many being luxuriantly planted with oranges and lemons, bananas, pomegranates, palm-trees, and a vast variety of shrubs and vegetables peculiar to Brazil, including the universal cabbage-plant, in great profusion. The aqueduct, which is passed in several places in the ascent of the Corcovado, and which we have engraved above, is a well-built and striking object, crossing several streets of Rio, and conveying excellent water from the heights of that mountain to the different fountains in the town.

AQUEDUCT AT RIO JANEIRO.

The population of Rio, on the arrival of the royal family, did not amount to 50,000, but afterwards rapidly augmented;

so that in 1815, when declared independent, the number had nearly doubled, and now is estimated at about 400,000, with the suburbs and the provincial capital of Nitherohy, on the opposite shore of the Bay. This increase is partly to be ascribed to the influx of Portuguese, who have at different times left their country in consequence of the civil commotions which have disturbed its peace, as well as of English, French, Dutch, Germans, and Italians, who, after the opening of the port, settled here, some as merchants, others as mechanics, and have contributed largely to its wealth and importance. These accessions of Europeans have effected a great change in the character of the population; for at the commencement of the century, and for many years afterwards, the blacks and coloured persons far exceeded the whites, whereas now they are reduced to less than half the number of inhabitants. In the aggregate population of the empire, however, the coloured portion is still supposed to be treble the white.

BOTAFOGO BAY, RIO JANEIRO.

THE DEAD BRIDAL.

CONCLUSION.

It was one of those delicious days in autumn, when the heat of the sun is tempered by the fresh breeze and the gray clouds that steal athwart the blue of the heavens. In the balcony of the palazzo upon the Adriatic, of which we have already made mention in our tale, two persons were sitting enjoying the cool sea-air, and conversing.

"How tranquilly yon bright water slumbers in the sunlight," said one of the two to his companion. "Who would ever think that not long since it was tossing to and fro in troublous billows? And just such is life. Ah, may ours, after the sorrows and trials which we have so lately endured, be henceforth peaceful and filled with sunshine, dearest Bianca."

The girl looked up tenderly at her lover. The traces of sickness had not yet altogether departed from her face, for her cheek was pale and her eye somewhat languid, but these enhanced rather than impaired her loveliness.

"Heaven grant that it may be so, dear Giulio. Heaven has been very merciful to me, first in saving me from a union that would have been worse than death, and next in preserving me through that terrible malady, which was fatal to my poor maiden Giovanna. Do you know, Giulio, it is a very singular fact that we were both born on the same day and hour."

Giulio remained silent for a time, as in deep thought; at length he said:—

"Dost thou remember the prophecy of the man with the rebeck in the gondola, that thou told'st me of?"

"Oh, yes! I have never forgotten it. How strangely true, in words, has it proved; yet how different in sense to what I feared. The bridegroom came indeed, and death entered in with him—but thou wert not the bridegroom, nor I the victim!"

"Well, thou must know that I too have encountered this diviner, and he has spoken strange and terrible things to me—a part of it still weighs painfully on my heart—that which he predicted when first I saw him. Yet do I hope that what I applied to myself was addressed to my companion; the rest has, I now perceive, received its fulfilment, for it related, not to thee, as I supposed, but to the poor girl thy attendant."

And Giulio then related his interview with the astrologer upon the evening of Giovanna's death.

"And now, dearest Bianca," continued he, "I have come to advertise thee that thou art to have an unwonted visitor to-day."

"Who may it be, Giulio? Thou knowest, that since my illness, I have received no one save thy father."

"Well, he comes by my father's permission, who will be here to receive him in person, and entreats that you will not refuse to see him."

"No more suitors, I trust," said the girl, with a frightened look.

"No, in faith," replied Giulio smiling; "on the contrary, he comes for the purpose of relinquishing all claim to thy hand. You must know that, upon my father's recovery from the plague, he informed Pietro Molo, the old goldsmith, that he still held himself his debtor, and proposed such arrangement to him as he is able to make. In return, the banker has requested permission to attend here, and formally resign all claim to thy hand on the part of his nephew. Thou wilt not, I trust, feel any disinclination to be released from the addresses of the wealthy plebeian, even though thou shouldst have to put up with a poor noble instead. But here comes Giudetta; I warrant she hath some news for us, she looks so important."

"Ah! dear children," said the old woman, looking lovingly upon them, for she had at length discovered their secret, "here is the count, fresh-arrived from the city; he has sent me forward with his greetings to my young lady, and he requests that she will receive him in her boudoir."

"Come then, dearest," said Giulio, "let me lead thee in. My father will rejoice to see the bloom again returning to thy cheeks."

The two young people passed in from the balcony to the apartment into which we formerly introduced our readers; Giudetta, with the privilege of a favoured servant, following them.

The Count Polani embraced his ward tenderly, and then seating himself beside her, he said,—

"My dear Bianca, I crave your indulgence for pressing this interview upon you. I would have gladly spared your feelings the recollection of a scene which this meeting cannot fail to revive. But the request was made so urgently by Messer Molo that I could not venture to refuse it, considering the position in which I stand in relation to him. You have, however, nothing to fear from his importunity."

Punctual to the appointed time, the banker reached the Palazzo Morosini, and was conducted to the boudoir where the count and his ward awaited him. Giulio rose to retire, but his father said, "I should wish you to be present as a witness, Giulio, unless Bianca object."

The girl bowed a ready assent, and added, "I, too, should desire that Giudetta stay near me; you know, dear signore, I may need the presence of one of my own sex."

"Be it as you will, then. Ah! here comes the goldsmith."

The old man walked up the apartment with the calm, self-possessed deportment which was habitual to him, and bowing with an air of deference, not unmixed with pride, he said:

"Count Polani, I am come to hear the terms you propose in relation to certain moneys which I had the honour to lend your excellency, upon conditions which have not been fulfilled. Be pleased to state your intentions."

"Messer Molo, I again offer you the same terms which I offered on the day the obligation became due: I am ready to pay three thousand ducats now, and to secure you the residue upon my palazzo in Venice, provided you cancel the bond."

"To that proposal, signor count, I reply now as I did before, that I shall abide strictly by the terms of the obligation."

The Count Polani was about to interrupt him passionately, but the banker, raising his hand, said quietly—

"I pray your lordship to hear me out. I was saying that I shall abide by the terms of the obligation. You, signor Polani, failed to pay me the moneys on the day specified, and thereupon I was entitled to demand from you the hand of your ward in the name of my nephew. That hand was not refused by you; but, on the contrary, I voluntarily relinquished it and withdrew my nephew. Therefore, sir count, I now release you from all obligation, and do here destroy the bond which you gave me." Saying which, he tore the instrument in two and handed it to the count. "And I formally acknowledge that I have no claim on the part of my nephew."

The count seized the hand of the banker with emotion.

"Nay, nay, good Messer Molo—thou art too generous—it must not be so."

"Your pardon, my good lord," said the banker proudly. "You once said that I was a just man, and I affirmed that you spoke truly; suffer me still to be so. I must not forfeit my own self-respect. I will now take my leave; but I will crave permission first to touch the hand of this fair maiden, whom I would have been proud to call niece, had not Heaven visibly interposed to forbid it."

The old man advanced to where Bianca sat, and, taking her hand, raised it respectfully to his lips, and then placing a jewel of great price upon her finger, he laid his hand upon her fair head, and uttering a fervent benediction, he turned to depart. At this moment the door was opened, and a young man entered. All eyes were turned upon the stranger.

"Ah, nephew Girolamo," said Molo, who met him near the door, "this is indeed unexpected. I did not know thou wert in Venice; but I have arranged all matters with the Count Polani, even as thou didst desire."

"Thanks, dear uncle," said the young man; and then passing by him, he flung off his travelling cloak and walked up the room. In a moment he was pressed in the arms of Giulio.

"Jacques! my dearest and best of friends. Welcome, a thousand times welcome!"

"What do I hear?" exclaimed the banker, who had hastened back after the young man.

"There is some mistake here; this youth is not called Jacques, but Girolamo—Girolamo Molo, the son of my brother Jacopo."

"Aye, truly, dear uncle, and yet my good Giulio here will not, you see, deny his old friend Jacques de la Mole."

"How is this?" asked the count in amazement. "Be so good as to solve this riddle for us."

But no sooner had old Giudetta heard the voice of the young man, than she hurried forward and cried:

"Santissima Madre! I swear by my hopes of salvation that this is none other than the learned Greek doctor, Demetrius, who brought the count and my young lady through the plague, and then disappeared so suddenly—aye, indeed, though he has lost his white hair and beard."

"The same, the same, good Giudetta. Suffer me to congratulate my patients on their thorough convalescence. Fair lady, you will not refuse your hand once again to your physician. My lord, the friend of your son seeks your acquaintance."

While the young man thus passed from one to another of the party, with the unembarrassed freedom of one of courtly breeding, all remained silent with wonder and perplexity.

"Count Polani," he continued, "you asked me to solve this riddle. I will do so, if you give me a few minutes' hearing;" and seating himself in the chair to which the count pointed, he said: "My good uncle here will tell you that the liberality and love of my father denied me no advantage which his wealth could procure. Thus I travelled much, visited most of the courts of Europe, and found that the son of the great banker of Milan was a welcome guest wherever he went. It so chanced that an affair connected with the loan of a large sum of money, which required great secresy and caution, led me to the capital of France for the first time some two years since——"

"I remember it well, nephew Girolamo," said the banker, interrupting him. "Thou didst acquit thyself very creditably in the affair. I warrant me your young ruffling gallants, who affect to look down upon us merchants, could not do as much."

The young man looked at Giulio with a smile full of meaning, and continued: "Well, I found it desirable to adopt an incognito; I assumed another name, gave myself out to be a Frenchman, and, that I might sustain the character appropriately, I did, my dear uncle, dress myself somewha

in the fashion of the young gallants of whom you have just spoken, and Jacques de la Mole had the happiness of making the acquaintance of Giulio Polani."

"Aye, faith, dear friend," said Giulio laughing; "and that same Jacques de la Mole was the most fashionable cavalier, the best swordsman, the luckiest gambler, and the most fortunate——"

"Hush! hush! Giulio," said Girolamo, interrupting any further disclosures; "you will make me blush if you praise me thus. Remember I had a part to play, and I tried to play it to the best of my poor ability. Besides, you know I was not always successful. Dost forget our gay wager on the banks of the Seine, and how I lost it to thee?"

Giulio smiled, and held up his finger admonishingly to his friend.

"Well, well, I shall not speak of it, at least just now. We had not long parted when I learned of thy strange compact, my dear uncle; and though I knew that thy love and thy ambition would select none for me but a most worthy object, yet was I determined to judge for myself; and so I visited Venice without thy knowledge, and again assumed my character of the Sieur de la Mole."

"It was well that I did not meet thee, Girolamo; I should have rated thee soundly for going about in thy mumming French frippery."

"Nay, but thou didst meet me, dear uncle. My first visit was to the Corso degli Orifici, where thou didst very civilly give me gold for one of my own bills on thee."

"Truly," said the old man, "I do now bethink me of a popinjay in a slashed velvet doublet and perfumed gloves, who wore a hat and feathers; I did not see his face, for he was masked; but he spoke only French, except one or two words of vile Italian."

"Precisely, dear uncle; you would not expect a French gallant to speak good Italian. Well, Giulio, thou rememberest our wager, and how thou didst often boast to me when in France that thou wouldst show me, if I ever came to Venice, a maiden fairer than those on the northern side of the Alps; and so thou didst keep thy word, and I lost my wager, and would have lost my heart too—pardon me, dear lady, if I be too bold of speech—but that I quickly discovered that one very dear to me (and he looked at Giulio) had already lost his to thee, and, as I believed, had stolen thine in return."

The Count Polani looked at Bianca and then at Giulio: the confusion of both betrayed a secret which a more vigilant guardian than the count would have long since discovered.

"By Saint Mark," said he, "pretty one, I have been but dim-sighted after all; I must have good old Father Chrysostom to confess thee; or perhaps thou hast made thy confession already to a younger ear, and we must reserve the good father for another office. Well, Ser Girolamo, or Jacques, or Demetrius, whichever it is your good pleasure to be called, we would hear the rest of your story."

"Ah, signore, it is well nigh told. As I said, I feared for my own heart, and had the good sense to fly.—Thou got'st a note from me, Giulio?"

"Yes, and I marvelled much at thy sudden departure, and still more at thy continued silence."

"Upon the day before the appointed day, I returned to Venice, determined to supply the money to liquidate the bond, in case the count should not be in a condition to pay. How I arranged the matter, Giulio, thou knowest; but why thou didst not make use of the bills I gave thee I know not."

Giulio informed his friend of the casualty that had befallen him, and detained him in delirium till the day was past.

"I will not dwell on the painful scene at the Palazzo Polani further than to say that, at the moment your lordship had appealed to me, and that I was about to disclose my friendship with your son and to decline the honour of a hand which, even were I worthy of it, would not have conferred on me a heart, the sudden illness of the signora rendered it unnecessary. We hurried from the palazzo; but not before I had satisfied myself, notwithstanding my uncle's precautions, that it was indeed the plague with which the young lady was seized. I had been long in the East, and had seen that terrible scourge, and learned of a celebrated physician in Damascus the best mode of treating it. Speedily procuring the dress of a Greek physician, I presented myself at once, and had little difficulty in procuring admission in the emergency. Heaven be praised, I was enabled to save the lives of two of the three; the other—"

"Ah! yes," interposed Giudetta; "the other my poor Giovanna. But see, Signor Demetrius, I have the amulet which you gave me, and it preserved me through the whole time of the plague—though I did not understand all the learned things you said to me."

Girolamo laughed gaily.

"Why, yes, I flatter myself I spoke with due professional unintelligibility. To-day I returned by chance to Venice, and finding that my good uncle had come hither, I determined to be present at the last act of a drama in which I had been playing more parts than my friends knew of. And now my tale is told."

And so, dear reader, may I say with Girolamo, "My tale is told." Yet, ere we take our leave for ever of those whose fortunes we have been following through many scenes, and for whom, I trust, you feel an interest, let us follow those fortunes to a close. As one who, from the cliffs, watches a bark buffetting with wind and waves, now mounting on the top of the billows, now plunged in the trough of the sea, till it disappears from his view—as such a one watches with anxious heart and strained eyes, till at length he sees the vessel enter the harbour—then his spirit is glad, and he breathes freely—nevertheless, he will surely hurry down to the water's edge and see the poor, storm and sea-tossed voyagers landed safely, and entering their happy homes;—just so do I hope that you, dear reader, would see those with whom we have had to do safe at their destination. Know, then, that ere a month had passed, Giulio and Bianca were wedded—the count gradually retrieved his fortunes and rose in the state, and finally became one of the Council of Ten. By a strange fatality, one of the last victims of the plague was Michaele Morosini who succeeded Contarini as doge. His immense wealth, which was amassed by the most sordid and heartless means, was divided between his relatives, and a considerable portion came to his kinswoman Bianca. Old Pietro Molo still dwelt in the Corso degli Orifici, to the end a wealthy and an honourable banker, who ever performed and enforced a contract with unflinching scrupulosity; and he had at length the happiness to see his dear nephew mated with a noble lady of Milan, and perpetuating the name of Molo, which he adorned not less by his magnificence and liberality than he did by the nobleness of his nature.

Three others there are, to whom our thoughts may revert with a pleasant interest. Of Carlo Zeno we need not say anything: his long, active, and most adventurous life; his peaceful death; his obsequies—magnificent and pompous as became a great state honouring the remains of her greatest son, and a mourning people paying the last tribute to their bravest general—all these are matters of history to be found on its brightest and broadest pages. The chronicler who turns aside to ramble through the byeways of history, will now and then meet with the name of Sir William Cheke, and find him still the soldier of fortune, ever gallant and true hearted, till at last he sank down in his harness upon the battle-field, and brave companions in arms gave him sepulture in a foreign land. And, last of all, stout Roger Harrington failed not of his hoped-for future. He won his way back to his own Britain; and beside the waters of his beloved Trent, even in that pleasant valley, through whose once sylvan solitudes the steam-train now thunders along upon its iron way—even there the smoke rose once again from his father's cottage; and, sitting near to him in the chimney-nook of a winter's evening, a blooming matron with mild blue eyes smoothed down the yellow curls of their infant boy, while she listened to the happy yeoman recounting his soldier's life and the feats of the memorable War of the Chioggia.

SKETCHES OF DOGS BY LANDSEER.

To no English artist attaches a wider popularity than Sir Edwin Landseer. All know his works, and all admire them. No collection of modern painters is complete without them, and the memories of them abide with us when our eyes have long ceased to gaze upon the originals. As a painter of animal life he is unrivalled. He gives more than the colour and the form. He endows them with life, and thought, and feeling, and soul. When we look at them, we almost go as far as certain philosophers, and believe in the immortality of brutes. At any rate, they seem to love and hate, and hope, and fight, very much like men and women. When we view his pictures, we feel there is no need to ask

"With Jacques Rousseau
If beasts confabulate or no."

friend. Landseer soon distinguished himself; he was elected R.A. in 1831, he received the honour of knighthood from Royalty in 1850. The list of his pictures is too long for us to chronicle here. His *chefs-d'œuvre* are the well-known ones called "Peace" and "War." The late Mr. Vernon gave 1,500 guineas for each, and since then Sir Edwin has received the enormous sum of 3,000 guineas for permission to engrave them. This fact shows the extent of his popularity. There is no test like the plain pounds, shillings, and pence one. A thing is only worth what it will fetch; nor is this popularity difficult to understand. Who does not love dogs? They are our playmates in childhood—our companions in manhood—our guardians in old age—and if in populous cities pent, we cannot keep them, still we like to have their pictures

LITERARY DOGS.

It is a fact they do. We can almost hear them talking. We see what the funny fellows are at. What happy brutes they are. How lightly and stoically they take the ills of life that dog flesh is heir to. Sir Edwin has been deservedly a successful man, and he certainly has been an industrious one. Every exhibition of the Royal Academy bears testimony to that fact, and in the ordinary course of events he may look forward to pictorial triumphs for many a year. He was born in 1803, and may be supposed to have had a bias to art from his very birth, for his father was an engraver. An artist, and the friend of artists, Landseer, if we remember aright, was with Haydon for a time, though he wisely forsook high art, as the world did not care for it, and has thus had an easier life than that of his early patron and

with which to adorn our rooms. High art is all very well, if you have space for it; but we English have not. High house-rents forbid our patronising high art. Smith can hardly get his wife and olive-branches into the fantastic abode he calls Minerva Lodge, and as to pictures like poor Haydon's, they are quite out of the question. They are nearly as big as Minerva Lodge itself. So, instead, we have recourse to Landseer, and with engravings of his pictures ornament our English homes.

But we must hasten on. The reader must pardon our digression; it is a bad habit Rabelais taught the writers of his age, and it has been common ever since. Let us now look at the pictures here engraved. As literary men ourselves, of course we give the preference to

LITERARY DOGS.

We take them in order. That dog with the great head, to whom the Italian greyhound is making some remarks of a light and trifling character, is evidently no common one. Burns' Cæsar, in his "Twa Dogs," was precisely such another :—

"His hair, his size, his mark, his lugs,
Showed he was none o' Scotland's dogs;
But whalpit some place far abroad,
Whare sailors gang to fish for cod."

How sensibly that dog could talk, every reader of Burns knows well. His companion was completely convinced by him. He made it as plain as a pikestaff, that your rich, dissipated, fashionable men have but a sorry time of it; and to do so he broached Waldo Emerson's favourite doctrine of compensation—a doctrine not so strange or novel as Mr. Emerson imagines, and our friend there is of the same opinion. He is a philosopher, a mature, sedate, steady-going dog, an affectionate husband, a dutiful father; in short, a very moral, model dog—a dog of years and discretion—a dog in whom you can confide, with whom you may do business, whose advice you may ask and take—such a dog as would write a good article on the wrongs of animals in the "Quarterly"—such a dog as would have great influence anywhere for his sagacity, strength of brain, extent of information, and moral worth. It is not surprising that he takes no notice of what that flippant greyhound is saying; and yet he puts up with it. At any rate, he exhibits no sign of impatience; your intellectual dogs never do that; they know as well as we mortals that

"The gods approve
The depth but not the tumult of the soul."

As to that conceited poodle on the left, with *Punch*, all he is fit for is to write a farce. He is clever, and thinks himself so; but he has no stamina, sir—no principles—your fast clever man never has.

But he has a rival in that Charles' spaniel on his right, and that pug with a blue ribbon just before him. Well, after all, he has more in him than either of them.

"His locked lettered braw brass collar,
Shows him the gentleman and scholar."

And if he would not be quite so fast, but read *Punch* less, and study useful knowledge more, as dogs are, he would do very well indeed. The dog with the *Times* is like the *Times*, you can't tell what it is. You can't calculate how it will turn on a question; what side it will support; all that you can safely calculate on is the display of a certain amount of intelligence. It is just so with the dog.

The next engraving has reference to

CONTRARY DOGS,

and contrary they are undoubtedly; as contrary as any imaginary husband and wife, referred to in Milton on "Divorce;" or, perhaps, what is more to the point, as any Mr. and Mrs. Caudle in life. That very little terrier looming in the distance shows fight, and this scraggy mongrel cur would only be too happy to accommodate him, if his fat friend was not of a peaceable character, and evidently an admirer of arbitration in preference to physical force. When one is thus tied what can one do, but show one's teeth and growl a bit,

CONTRARY DOGS.

and then run away? and this is what our lean and angry cur will have to do. The more he chafes the worse it will be for him! Neither man nor dog can war with circumstance. There he is tied, chained to a fat peace-loving dog—a dog whose bark is more to be feared than his bite—a dog you may insult, spit upon, call fool; kick even where, according to Hudibras, honour is lodged, and take any liberty with him, and yet who will not be avenged. Don't trust him; such a dog would leave you in the lurch; and were you attacked by a highwayman or a footpad, would run off like the poltroon that he is. Nor is the cur much better. He would be quite as likely to bite you as the man that knocks you down. He is sly, treacherous, ill-bred, and has no good points about him. They are a bad lot. The two are not worth one good dog. They are a pair of ill-conditioned, ill-bred rascals, and will never be any use to themselves or their owners, or the public at large; they are not worth the tax, and probably live by a mean and unprincipled evasion of it. And that little plucky terrier—the evident hero of a hundred fights—knows it, and would give the two a thorough drubbing if they would only give him a chance; and serve them right.

THE FUNGUS TRIBE.

CHAPTER IV.

Dr. Badham, the author from whom we have so frequently quoted, says:—"For the single mushroom that we eat, how many hundreds there be that retaliate and prey upon us in return. To enumerate but a few, and those of the microscopic kinds: the *Mucor mucedo*, that spawns upon our dried preserves; the *Ascophono mucedo*, that makes our bread mouldy; the *Uredo segetum*, that burns Ceres out of her own corn-fields; the *Uredo rubigo*, whose rust is still more destructive; and the *Puccinia graminis*, whose voracity sets corn-laws and farmers at defiance, are all funguses." The main body of those fungi which make war on man are microscopic; yet so strong and indefeasible are they in their multitudes and their pertinacity, that man has in most instances no power to withstand their forces. Their very minuteness is in their favour, for who can stand against an invisible, noiseless, and scentless foe, whose very presence he has no means of detecting until he has fairly taken possession of his property at every assailable point? To the list given above, we must add many more. There is the Ergot (*Spermædia clavus*), a species which infests grasses and corn. When developed in the latter, it produces the most dreadful disease in those who unfortunately partake of the infected grain. It is chiefly found in rye, but happily not very frequently met with in this country. Berkley says: "It is most curious that this production, when occurring in great abundance among rye, as it does frequently when that grain is extensively cultivated, and unavoidably composing a considerable part of the bread, gives rise to one of the most fearful and distressing diseases with which the human race is afflicted; in which the limbs gradually waste away with horrible pain, and eventually fall off." This little fungus, though so dangerous in its effects when eaten, is nevertheless invaluable for its medicinal uses. It is a little cylindrical horn-shaped body; purple-black without, and white or purplish inside.

Whether the injury to human life of which we have spoken is caused by the fungus itself, or by the decomposed and corrupted state of the corn to which it belongs, is still a matter of question amongst the learned, and one on which we can, of course, form no judgment.

The genera which chiefly affect the cereal produce of our land are the *Uredines* and *Puccinieæ*. The former genus takes its name from *uro*, a Latin word, signifying "to burn," or "scorch," the discolourations and spots on the plants infested by these fungi having been formerly attributed to blasts or injuries caused by the atmosphere or the heavenly bodies. There are two species of this genus that are almost equally dreaded by the farmer; one called "the smut" (*Uredo segetum*), the other, "the bunt" (*Uredo caries*).

The former of these takes its rise within the glume of living plants, and grows with such rapidity as speedily to fill the interior space and burst through the epidermis, when it appears like a profuse black dust, which, if microscopically examined, is found to consist of minute, perfectly spherical sporules. Withering says of this species: "It consists of very minute, egg-shaped, stemless capsules, at first white, but the thin white soon bursting, it pours out a quantity of brown-black powder mixed with wool-like fibres."

The other species, *U. caries* (fig. 1), is very common in wheat, and exceedingly injurious, as it not only destroys the ear on which it grows, but every grain with which the infected individuals come in contact. It is included within the germ of the wheat, and the spores, which are exactly spherical, are longer than those of the above-named species (*U. segetum*), and quite black. When crushed they emit a most fetid odour, which is communicated to the whole sample of wheat with which the bunty grains are associated. Mr. Berkley says of all the corn-infecting fungi: "The growth of these parasites depends so much on accidental circumstances, that it is impossible for the most experienced cultivators to guard against it entirely; but the evil is greatly lessened by careful choice of seed, and by steeping it in solutions of different substances, which destroy the vegetative power of the sporidia of these parasites, etc."

The other genus, *Puccinia*, is of as evil a nature as the *Uredines*. The disease termed "the mildew" in wheat is produced by one of these (*Puccinia graminis*, fig. 2), a fungus so diminutive that a single *stoma* (or pore in a stem or leaf), itself a thing invisible to an ordinary eye, will produce from twenty to forty of these fungi; and each of these exquisitely minute plants will bring forth at least a hundred spores or seeds. The seeds are not much heavier than air; and it may easily be conceived that even a single stem of wheat or grass, when beset with these mischievous parasites, will not be long in infecting all the corn, not only in the field where the injured wheat grows, but in all those adjacent to it.

The first appearance of this blight is usually in the spring, or early in the summer, when it arises in the form of orange-coloured streaks, which afterwards assume a deep chocolate-brown. The tufts of this fungus are dense and often confluent, and forming long parallel lines (fig. 2, *d*). The spores are contained in a tubercular double-celled case, and are black; this case is supported by a filiform peduncle or stem, as seen in fig. 2, *b*.

There is a fungus exceedingly like this, if not the same, which infects barberry-trees. It is larger; but as different soils produce different-sized specimens of the same species of other fruit and vegetables, so may different living soil nourish the same parasite into more or less luxuriance. It is certain, at all events, that wheat or other corn grown in the neighbourhood of the barberry-tree always gets blighted with this *Puccinia*, and it is, therefore, not unreasonable to think that it may be infected by it. It has been suggested (and probably with reason), that the reproductive particles or spores of this and other fungi are dispersed by the air, and sucked in with the water which falls on them into the earth, whence they are absorbed by the pores of plants, and so introduced into their system. In other cases, where they have lodged on the leaves or other external surface of the plants, they are washed by the rain into the stomata or mouths with which the cuticle of almost all plants is thickly beset, and by means of which they drink in a portion of the dew and rain from heaven; and these spring up and grow, intercepting the supplies of moisture from the plant, and at the same time interfering with its functions of respiration, by blocking up the pores; and thus they weaken and destroy the plants on which they feed, so that the grains on a stalk of wheat infected by this disease are not half the size, nor have they the same proportionate amount of farina that those grown on healthy stems possess. It is, however, a remarkable fact, adduced by the best authorities, that these poor diminutive grains will, if sown, produce as fine a crop as the finest and most flourishing seeds. This is worthy of remark, as, though useless or nearly so for food, the withered grains may thus be turned to account, and save the farmer's better samples for other uses.

But it is not on our corn-fields only that a plague of fungi rests; these little *puccinieæ* attack the leaves of plum and other fruit-trees, devour the fluids of our bean-plants, and scatter themselves in destructive armies over our raspberry-bushes and our rose-beds (figs. 3 and 4). There are some forty or more species which spread themselves in all directions on the leaves and stems of our plants and flowers, nor ever cease their ravages until they have destroyed the vitality of whatever part they touch.

But we must now turn to another class of fungi—those which beset our dainties under the name of "mould." There is so interesting an account of this production in a paper published in the pages of a contemporary, that we cannot do better than transcribe a part of it as it stands. "If, during the warm weather, we put aside a bit of bread, or a slice of apple, pear, melon, or a turnip or potato-pealing, if nothing better is at hand, we shall find in a few days that all those substances will have assumed a mouldy appearance.

Take a little of this mould gently off on the point of a penknife, and subject it to the microscope: you see in the moulded bread a grove of tall stalks, each with a round head slightly flattened; in short, a mushroom in miniature. This is the *Mucor mucedo* (fig. 6, *a*), the fungus of the bread-mould. While fresh and young, they are of a beautiful milk-white colour; gradually they assume a yellowish tinge. The stalks are so transparent as, under a good magnifying power, to show the cellular structure inside; the bulb also now exhibits, under a thin bark or skin, a number of minute circular bodies, all arranged in a compact form: these are the spores or seeds. After a day or two more, the fungi begin to ripen, and assume a brownish tint; the bulbs blacken; the skin bursts, and innumerable spores are scattered about, many floating away in the air. This forest of mould, like larger ones, is liable to accidents. You may see in one corner, for instance, that the bit of bread forming the soil has cracked; thus a fungus has been loosened at the root, and it falls down, we may suppose, with a crash, though we still desiderate instruments to magnify and make audible the sound. Nevertheless, the effects of the fall are visible in the breaking down of neighbouring stems, and in the premature scattering of the seed. You may see, too, sometimes the scattered seeds collect upon one or two plants, and, enveloping them, entirely destroy their vitality, and thus cause old, rotten-looking stumps."

It would indeed be curious and interesting if any instruments could be discovered which would extend the scope of the other senses in a degree commensurate with what has been done for that of sight. If we could hear the sounds emitted by microscopic insects, and smell the odours exhaled from invisible and, as we now believe, scentless microscopic vegetables, it is not unlikely that many new and remarkable phenomena would be made known to us. But such discoveries remain as yet unthought of.

But it must not be understood that the mouldiness which we find on our eatables is always a crop of the same species of fungus, or even of different species of the same genus. It is not so. The kinds which infest the apple and the pear are different, and those which "rot and then fatten on" our grapes, plums, and raspberries, are all different from each other. Then there are other kinds which float in our fermented liquors; whilst others again are found within the nutshell; and even within the innermost cavities of the walnut. Some, "like leeches, stick to the bulbs of plants, and suck them dry;" whilst others, not content with a vegetable diet, lay hold of the hoofs of horses and the horns of cattle; nay, worse and worse may be said; for instances have been known of the lungs and other organs of human beings having been beset by these all-destructive little beings. It is also recorded that it is a rare thing to find a mouth, whether of man or woman, where the teeth are not more or less the habitats of these vegetables, which, it is said, can be kept off only by the free use of a well-soaped tooth-brush.

Fungi not only prey on objects which are members of other families than their own, but they unscrupulously devour each other. Many of the *Pileati* have parasitic fungi, which attach themselves solely to them, never attacking any other species. One sort settles itself on dried *Agarics;* another only on moist decaying ones; whilst a third devours only the flesh of a particular *Boletus*. Dr. Badham says: "Few minute objects are more beautiful than these mucidinous *fungi fungorum*. A common one besets the back of some of the *Russulæ* in decay, spreading over it, especially if the weather be moist, like thin flocks of light wool, presenting on the second day a bluish tint on the surface. Under a powerful magnifier myriads of little glass-like stalks are brought into view, which bifurcate again and again; each ultimate head ending in a semilucent head, or button, at first blue, and afterwards black; which, when it comes to burst, scatters the spores, which are then (under the microscope) seen adhering to the sides of the delicate filamentary stalks, like so many minute limpets. There is a very beautiful fungus called "the pencilled mould" (*Aspergilla penicillatus*, fig. 5), which clusters its pretty beaded tassels on the dried plants in our herbariums. This little plant consists of a stem and a cluster of sporules at the top, not unlike a brush with a handle. *Aspergillus* is the name of the brush with which the holy water is sprinkled in Roman Catholic churches, and from this resemblance the genus takes its name. *Næmaspora Carpini* (fig. 6, *d*) is another curious species. This infests the dead wood of the Hornbeam, its singular black spores escaping from their flat cases, and thrusting themselves upwards in the form of tendrils. Then there are the many species of *Sphæria*, which raise their little button-like forms on the branches of trees, and stud them over with sphere-like gems, some yellow, others scarlet, brown, black, orange, white, crimson, and a hundred other tints of richest dye. Sometimes these wonderfully varied little fungi are sessile on the substance they have selected for their habitat, as at fig. 7, *c*, *d*, and *e*; at others they are raised on stalks. Some have smooth visible orifices through which the spores escape; in others, these openings are hairy; and in some species they are not visible at all.

Besides frequenting living plants, and closely besetting their leaves and branches, fungi of this genus are found abundantly on the bark of dead branches, and even on the wood where the bark has been removed. They frequent also the flock of *Agarics;* and one species, "the nest-like Sphæria," is found in the little hollows of bean-roots, whilst others cluster on apples that are lying on the ground, the stems of reeds, or even on the naked earth. There are some species which take up their abode and obtain their sustenance from dead larvæ, pupæ, and spiders' eggs; whilst one, cannibal-like, "the red Parasitic Sphæria," sucks the blood of some of the species of its own genus. So numerous are the species which rank under this genus, that 201 are catalogued by Berkley.

Racodium cellare, "the mouse-skin byssus," is the fungus which festoons and covers the walls of our wine-cellars. For specimens, Badham refers us to the "London Docks, *passim*, where he pays his unwelcome visits, and is in even worse odour than the excisemen." Loudon tells us that it takes its name from a word "used among the Greeks" for a worthless, worn-out, ragged garment, which has been applied to the present genus in allusion to the dirty, interwoven, cloth-like substance with which it clothes whatever it grows on. *R. cellare* is the black substance which overruns the bottles of the wine-merchant, and which often hangs in long thick festoons from the sides and roof of his wine-cellars.

There is a very curious species of fungus which is found overspreading the thing on which it grows like froth. Withering, on the authority of Stackhouse, thus describes it:—"Its first appearance is like custard spilt upon the grass or leaves. This soon becomes frothy, and then contracts around the blades of grass or leaves in the form of little tubercles united together. On examining it in its different stages under the microscope, it first appeared like a cluster of bubbles, irregularly shaped, and melting into one another. In the second stage it appeared imbricated, or tiled, with open cells, the edges of the cells beautifully waved. A blackish powdery matter, on the surface of the cells, now gives the plant a grayish cast. In the third stage, the wavy imbrication disappears, and the plant settles with minute tubercles united together. Some of these are closed; but many of them appear as if torn open, and out of the cavity emerge little downy strings, with irregular-shaped terminations, and other similar irregular bodies on the same strings, like the heads of some of the genus *Mucor*."

The blight which has lately beset the vines and trees whence we have been used to obtain our supplies of raisins and currants (which, if it continues to exert its evil influence, will reduce poor John Bull to the necessity of finding a substitute for the delight of the nation, plum-pudding), is said to be produced by a growth of fungi; but whether this is so is, as yet, scarcely an ascertained fact.

From all we have said, our readers will not be slow in admitting that, minute as these little plants are, and apparently insignificant, they are capable of being made, in the hands of God, instruments of most serious and destructive effects, not only to the property, but also to the life of man.

We must not, however, forget, that although some of the fungus tribe are undoubtedly most injurious in their ravages when they beset our crops or attack our timber, yet it cannot be questioned that the whole tribe has a very important part to play in the economy of nature, and is exceedingly useful to us in many ways. We have seen that some of them are out seems to have a special commission to assist in the work of scavengers, by aiding the multitudinous host of grubs, reptiles, and other devourers, in removing decayed matter (both animal and vegetable), which, if left to putrefy, would in many instances become destructive both to the comfort and health of those higher beings to whom it has pleased God to

capable of being turned to important uses as a nutritious and wholesome article of diet, and that others have medicinal properties which render them highly valuable. One kind is employed in making ink, another is used in the place of leather, whilst several kinds are serviceable in dyeing.

Besides these and other individual uses, the tribe throughout place the whole creation in subjection; and thus the absence of this tribe of the vegetable kingdom from the earth would prove infinitely more injurious to their interests than all the ravages of those species which combine against them in the form of "smut," "bunt," "mildew," "mould," or "dry-rot," or whatever else could possibly be.

THE SACRED DEBT.

FIRST PART.

FTER the toils of the day were over, four students of a small erman university met, as they were accustomed to do, at the partments of one of their number for the performance of usic. It is well known with what enthusiasm music is ltivated by the Germans. The majority of them possess a atural taste for this art, of which they are so fond; and the oor as well as the rich find in vocal or instrumental music a nstant source of enjoyment. These young men, after their ore serious studies, diverted themselves during the evening

THE SACRED DEBT.

ith playing quartettes composed for two violins, a viola, and violoncello. During an interval of repose, their light, joyous nversation was interrupted by an old beggar, who, halting nder the window, began to sing in a broken voice. He companied himself on a harp, which was too much injured exposure to retain its more sonorous vibrations; neverheless, the accompaniment was soft and melodious, and the oice sweetly tremulous. The burden of his song ran thus:—

"Oh, give to poor Peter
A cottage, I cry,
An orchard around it,
His wants to supply.
Content with such riches,
Oh, think it not strange,
Estates with his highness
He would not exchange."

When he had concluded, he raised his eyes towards the window where stood the young men. One of them, throwing him a piece of money, said laughingly:

"Here, poor Peter, this is all we can do for you now; return some other time."

"Yes, in a year," said another.

"And we will give you sufficient to purchase a cottage," said a third.

"In a little orchard," added the fourth.

The old man was struck motionless. The lamp over the doorway of a neighbouring inn shed a pale light upon his long white hair. After a moment's reflection, he again raised his eyes to the window and said:

"Young men, are you serious in what you say to me? I hope you would not mock an old man."

"God forbid!" replied Ernest with emotion. His three companions also called God to witness.

"Well, young men, I trust you; at this same hour, a year hence, I will return to this window. Adieu! May the Almighty, whose name you have invoked, bless your undertakings!"

Having given utterance to this benediction, the old man departed. The students closed the window and again took up their instruments. In a few moments, three had forgotten this little scene, and trifled as before; but at the close of the evening Ernest said to them,—

"You appear quite at ease; I must say I am not so, when I reflect on the promise I have made."

"What promise?" said the most heedless one.

"Why, the cottage and the orchard."

Their only reply was a shout of laughter, and thereupon the students separated.

The concerts were continued, and each time the friends met, Ernest reminded them of the promise made to the old man, but found that his zeal was most unwelcome.

"I am surprised," said he, "that you oblige me to insist upon a thing so self-evident. Either we have spoken seriously, and should act accordingly; or we have been guilty of impious mockery, and should endeavour to atone for our fault. My friends, I shall not sleep peacefully, until I have found means to discharge our sacred debt."

"How can we discharge it?" said Christopher; "our parents deprive themselves of necessaries to furnish us with a pitiful maintenance; and even could we live upon air for six months, and unite our little income, it would not be sufficient to purchase the most miserable hut and the smallest orchard for the old fool. If we have been to blame in promising, he has been equally so in accepting our promise. So, quits! Adieu, comrades; I wish your sleep may be as undisturbed as my own."

This fine reasoning could not convince Ernest, nor restore his peace of mind. His mother, noticing his thoughtfulness, became anxious. The good woman, who was a widow, had but this son, and, that they might not be separated, had accompanied him to the University town. The daughter of a peasant, and the wife of a village schoolmaster, poor Catherine had learned to practise the most rigid economy, and hoped, by that means, to eke out the little sum which remained of her paternal inheritance, until her son could maintain himself and his mother.

She wished to know the cause of his sadness. And Ernest made the painful acknowledgment. He saw by his mother's serious look that she thought with him, that such a promise ought to be religiously kept. Indeed, his own judgment was the result of his mother's early instructions in the principles of honour and piety. And should she be untrue, when her son had thus shown himself faithful to her lessons? Catherine could not be guilty of the too common sin, of contradicting her words by her conduct.

"Alas! my child," said she with a sigh, "you have commenced life by incurring debts. Nevertheless, whatever your companions may do, you at least shall fulfil your part of the engagement into which you have entered; if you do not, you are not my son."

After this conversation, Ernest devoted all the time he could spare from study to devising some means of redeeming his promise. He was one day walking on the borders of a forest, absorbed in the contemplation of this subject, when he came upon a little cottage delightfully situated in a charming valley. The cottage was surrounded by a small orchard, now clad in the verdure of spring. Passing the rustic entrance, he perceived that it was for sale.

"This would suit our purpose," said he, gazing around.

Impelled by curiosity, he entered, and approached a man of middle age, who was seated on a bench formed from the trunk of a tree.

"Your farm is for sale, sir?" said he, colouring

"Yes, my friend; do you wish to purchase it?"

"I am deputed," replied Ernest, hesitating, "to procure estate for a friend. What may be the price you demand?"

"Two thousand florins (about £160)," was the reply.

"Two thousand florins!" exclaimed the poor young m in affright.

"It appears to you a high price, my friend; but do y expect a house and grounds are to be had for a morsel bread? Look at these trees; their flourishing conditi proves the goodness of the soil. Look at this house; it is n a castle certainly, but there is room enough for happine within; and I would not leave the Pré Fleuri, were it not th I wish to be nearer my children, who have married far fr hence."

"Yes, indeed," said the student to himself; "there is roo enough for happiness. I should be well contented with myself."

While he thus reflected, the man rose to conduct him the house. After they had gone over it, they took a turn rou the grounds. Ernest admired all he saw, and acknowledg that two thousand florins was only a reasonable demand for eligible an estate.

He left the house, thinking it was something to have fou the cottage and the orchard, and flattering himself that should conclude by discovering the means to purchase them

He was absorbed in these thoughts until he entered t town, when, meeting in the public gardens a troop of wande ing musicians, he suddenly recollected that his frien expected him that evening to join their little concert. It w their first meeting after a fortnight's vacation, which they h passed at their respective homes.

They met at the usual hour, and after the first salutatio Christopher said that he had something to tell them bef they commenced.

"And I also," replied Augustus, "have something to s to you."

"Well, indeed," added Frederic, "and so have I."

"And when you have all finished," said Ernest, "I m beg you to listen to my tale."

Christopher began:

"I was crossing," said he, "the forests of the Hartz mou tains, on my return home. I was alone, and on foot. As t night closed in, the weather became stormy. When I was the middle of the wood, the tempest commenced. If I attem to describe it to you, it must be chiefly from imagination, I soon lost my presence of mind. The howling of the wind the crash of falling trees—the torrents of rain and hail—we heard even above the incessant roaring of the thunder. T continual flashing of the lightning, bursting upon the profou darkness, so dazzled me, that I durst not open my eyes, proceed a step. Ah! friends, you know not what it is to overtaken by a tempest in the midst of a forest. Hitherto had fancied myself a brave man; now, I frankly confess, know what terror is. I leaned against a tree for support my trembling limbs. Suddenly a thunder-bolt fell a few st from me, and struck an oak which was instantly in flam Here was new danger—the forest may soon be on fire. gathered courage to move a little further on; but it was last effort; I fell first upon my knees, and then my wh length upon the wet moss. There I passed the most dread night of my life. I thought of you, my friends, of our co certs, and of the old beggar. I said to myself: 'This i warning from Heaven. Unhappy being that I am! If escape this danger I will amend my life, and I will keep t promise that I made.' At length the storm abated, and I l the frightful wood; but though the peril is over, the prom remains. This, my friends, is what I had to tell you; an now join with the wise Ernest in entreating you to fulfil engagement."

"You will have little difficulty in persuading me," s Augustus. "During my stay with my parents, I visited Castle of Weissberg. The owner of that fine residence adorned it with more curiosity than taste; and, perhaps, would not repay the trouble of a visit, had he not also filled

vith singular inventions. Among other things he has erected magnificent triumphal arch in one of the principal walks, vith this inscription over it in letters of gold:—'This is the ate of good faith; pass it not unless thou art true to thy vord.' I was in a large company, one of whom read the nscription, and called our attention to it, upon which they all assed gaily on. Had I refused to pass, I should have stood n acknowledged liar. I therefore advanced boldly, and assed under the arch. Since that day I have had no peace f mind, for I feel that having pledged my honour before so nany witnesses, I cannot withdraw."

"Then," said Frederic, "we are all agreed to comply with ur comrade's request; for a circumstance no less singular han those you have related, has determined me to keep my vord."

"Oh, my friends," he added, "when my grandmother used o relate to us her dreams and their predictions, we would augh and shrug our shoulders behind her; but I am now as redulous as she was, and you will not be surprised at it vhen I tell you the dream that I had twice successively. I lo not believe that Christopher felt more terror in the forest han I on my bed, when I saw, for the second time, the old nusician stop in the street below, grinning and twanging the trings of his old harp. He suddenly grew to the height of he window, and putting in a dishevelled head, and stretching ut a skeleton arm, he seized my violoncello, which became n enormous double-bass, opened it, I know not how, thrust ne furiously into it, and carried me away with him upon his houlders, notwithstanding your cries and my own. You may augh as much as you please, but I am convinced that this eggar is some great personage, with power to punish us if ve offend him. I will not expose myself to it, if I can but nd the means of satisfying him; but unhappily my dream evealed nothing on the point."

Ernest congratulated his comrades more upon the resolution hey had formed than on the motives which had influenced hem; and added, "Let me now tell you, that I have found vhat we want."

"Ah, really!" cried they all in astonishment.

"Yes, I have found it. In a charming valley near the town, I discovered a little house standing in an orchard, which will suit us exactly, and our old man will no doubt be satisfied. The estate is to be sold for two thousand florins."

"Two thousand florins!" exclaimed they all together.

"I think," said Christopher, "we shall be a little nearer the conclusion of this affair when you have told us where we are to find the money. Instead of this you speak of purchasing, while we have no means of paying for it beyond a slip of paper."

"Wait," replied Ernest; "I shall, perhaps, have a proposition to make to you; but, first, I wish to know whether you have consulted your friends, and if they are not disposed to make a little sacrifice to assist you in this matter."

One of the students replied, that he durst not say a word to his father, for fear of being turned out of doors; another, that he had spoken of it to his tutor, who ridiculed him, and said it was time enough to pay when he was obliged; and the third said that his uncle, upon whom he depended, was violently enraged, and declared, if he should meet the beggar, he would denounce him to the police, and have him taken to prison."

"Then," said Ernest, "we are thrown upon our own resources; and now for what I was about to propose to you. As I came through the public gardens, I met a troop of strolling musicians. They made noise enough, but their music was miserable; however, the good people scattered money liberally among them. I flatter myself that we have a little more skill than they, and we have good instruments; let us take advantage of the approaching vacation; disguise ourselves, and travel over Germany with our violins; we may, perhaps, succeed. Such is my advice; if it does not please you, and you can propose a better plan, I will willingly agree to your proposition."

It was received with applause. Such an idea would be likely to please Germans. The manners of the country are such that it would be considered no degradation. Far from seeking another expedient, they assured him they could imagine nothing to be compared to it. They would see the country, they would lead a life of romance, they would earn applause, and florins also to enable them to keep their word. The project was admirable!

RUSSIAN SERFS AND RUSSIAN NOBLES.

THE position of the Russian peasant before the herd of boyards nd princes—slaves and serfs themselves before their despot n St. Petersburg, tyrants and masters at home—is pointedly narked in our engraving of a boyard giving audience to his erfs, on his return to his estates after a long absence. But a ecent tourist gives us facts to deal with.

Not very long ago he penetrated to an estate some seven undred miles from St. Petersburg. It was a vast territory of ome 100,000 acres, with 200 villages, inhabited by wretched erfs, the property of Prince B. . . . He accompanied the ourist, who describes the enthusiasm of the tenantry, as he acetiously calls them, as very great. They came out to reeive their master with their *starostes* (elders) at their head; oud shouts filled the air, every one wore his best clothes, and he cold but bright sun shone above. A flag was raised on the ummit of the castle, and on reaching the courtyard, speeches vere made on both sides; servile on the one, haughty and ondescending on the other—a right royal affair altogether. Then dancing, singing, and eating commenced, brandy was freely listributed, and everybody went home, not sober but merry, he Russians being no friends to the temperance movement. They are slaves, and drinking is peculiarly the vice of laves.

In ancient days an old boyard made his return to his states an opportunity for making money. As soon as he had reached his castle, he installed himself in a large audience-hamber, and there seating himself on a throne, his left hand resting on a cushion, he received homage from his vassals. They came crawling on their knees, their eyes on the ground, o the throne of their master, and each deposited in a copper urn a rouble of silver, about three shillings. This tribute once paid, the boyard became affable and friendly with his vassals, according to the customs of his family.

So wedded are the Russians to habit, that though this custom has been abolished, the peasants still bring the rouble, and are really disappointed that the young prince, the descendant of the old boyard, will not take it.

The traveller is struck, on arriving upon the territory of a Russian nobleman, with the excellent state of the roads. They are like the walks of a park, turfed and bordered by fine trees. But this state of things exists only upon the roads near the castle; the roads at a little distance are horrible. With three exceptions, there are no high roads in the whole vast and so-called civilised Empire of Russia. There are tracts of indefinite width, covered by sand, disfigured by stumps of trees, crossed by streams, with here and there a wretched imitation of a bridge.

If, however, the roads are bad, travelling is secure; and though accidents are common, the Russian peasantry are so exceedingly obliging and friendly in their disposition, that they will run a mile to assist in getting a carriage out of a bog or deep rut.

The inns are infamous. The traveller who does not bring his food must abstain, and he who does not bring his bed must sleep on the floor. There you lie, travellers and luggage, all pell-mell, close together—so close that, as our tourist says, "we scarcely left space for the vermin to attack us." Filth and discomfort of every kind is the ordinary state of things in these caravanserai; and the Russian nobleman never risks a night in one of them without cooks, beds, cushions, food, and drink.

At Schlusselburg, M. Leouzon le Duc met with the following adventure. He was coming back from Lake Onega. It was bitterly cold. He had been two days and two nights in his carriage. His limbs appeared frozen. At two in the morning he reached the post-house; its rooms were all deserted—no light, no fire, all dark and cold.

"*Maltchick! maltchick!* Boy! boy!"

A sleepy voice, from under a sheepskin on the floor, answered,

"*Seitchass!* Directly!"

Now in Russia people always say *seitchass*, but they never are ready. He waited for a quarter of an hour, shaking in the cold, and worn by hunger and thirst, while the boy lit his lamp, himself shivering.

"Quick! Fire and tea."

"Hot water!—but where is your fire?"

"We have only some spirits of wine."

And this is the country, the panegyrists of which talk of its rivalling England.

To return to the nobles. Their life in the country, where they are despots, makes up for the humiliation of their town existence. They lord it here, as they are lorded over in St. Petersburg; they receive petitions only on the bended knees of supplicants.

At nine the boyard takes his morning tea, smoking his pipe all the time; at eleven he breakfasts, and then roams about his estate; at four he dines, and at eight he takes his evening tea. His life is sometimes diversified by hunting, fowling, and by official festivals.

It is a completely royal existence. In their castles, the

RECEPTION OF SERFS BY A BOYARD.

"*Ni mogena!* Impossible!"

"Why impossible?"

"The stoves are all out of order, and will not be mended for two days."

"Fool!" said le Duc.

"But, your excellency, it was very hot yesterday here, and will be hotter still when the stoves are mended."

"What is that to me? Bring me a *samovar*."

The *samovar* is a kind of tea-kettle, which gives out so much heat that it serves at times the purpose of a stove.

"*Ni mogena*," said the boy.

"Why?"

"All the charcoal is burnt, so that the *samovar* cannot be heated. I can give your excellency nothing but a teapot and hot water."

hereditary boyards know no law but their own will. Some are gentle and paternal in their conduct, but many are tyrannical to the last degree. A peasant insurrection, and the destruction by fire of a castle and all its inhabitants, sometimes give us an insight into the character of the relations which exist between master and slave.

The Russian serf, on an average, works three days for himself and three days for his master. He cannot rise above a certain level. If there are fifty labourers in a village, they have fifty plots of land, of equal size, with five over for those who are likely to marry in the year. That plot they may cultivate, and no more. They cannot leave the village without permission. The duty to the master is called *obrok*; some pay it in money, some in work. The serfs are all hard drinkers, and their lords encourage them in this pernicious habit.

OUR STREET.

Onslow and Son's was the only shop in our street. It was a very ancient-looking shop, and the oldest person in the parish could not remember that any other establishment had ever existed in the same locality. For three generations, at least, the firm of Onslow and Son had flourished, without the slightest opposition. As an older Onslow died, he was succeeded by Son, and, in like manner, a younger member of the family was advanced to take his position as second in the firm. In this manner they went on, without supposing that any change could ever possibly affect their condition.

It would be difficult to describe the exact calling or profession of the members of this firm. They dealt in all kinds of linen and woollen drapery, stationery, and drugs. Occasionally they acted as physicians or apothecaries, and prepared the only cattle medicines that could be procured in the neighbourhood. They kept the post-office, and distributed stamps, were agents for a life and fire insurance company, and transacted business on behalf of the country bank. Yet their premises were not large, nor their stock-in-trade extensive. The windows of the shop, which projected considerably over the narrow pavement, were supported on wooden posts, and elevated to a level with the vision of a full-grown person. The pane of glass, of modest dimensions, were surrounded by strong, solid-looking frames, an inch and half in thickness. In those days it was not deemed necessary daily to exhibit a fresh assortment of goods, as the means of attracting stray customers. Onslow and Son supplied all that was wanted in the neighbourhood, so that any such labour on their part would have been expended to no purpose. Once or twice a-year the business of their establishment was almost entirely suspended, in order that a thorough cleansing and "putting to rights" might be accomplished. This being done, the same faded ensigns of the trade were restored to their former place, in the same order as they had maintained during the greater part of a century. The door was several steps above the level of the street, and was usually closed, which gave to the whole establishment an exclusive and uninviting aspect.

THE OLD SHOP IN OUR STREET.

On the entrance of any one into the shop, Mr. Onslow or Son generally looked through a small window, which communicated with the little back parlour; and having finished his tea, or satisfied himself concerning the correctness of a bill, or discharged any other duty in which he might happen to be engaged, he would at length come forward, and desire the waiting customer to say what was wanted. Now it sometimes happened, that amidst the multiplicity of their wares

the principals themselves were uncertain whether the article on demand was amongst the number.

"I believe," the shopkeeper would sometimes say, "that I have somewhere that which you desire. I've a faint recollection that there's something of the sort on one of those upper shelves."

Accordingly, a parcel was brought down from its hiding-place, but its contents were not the goods in request; so the package was deliberately re-corded, and safely lodged in its former position, before another search could be made. After several unsuccessful attempts, the right parcel was at last found, and the customer having taken a portion, at a price which awarded Onslow and Son a profit of 50 per cent., the remainder was again deposited on the upper shelf, to rest undisturbed for one, three, or seven years, as future circumstances might determine. Onslow and Son never asked their customers if they wanted anything more. They never used any power of persuasion to induce a fair visitor to increase the number of her purchases, by exhibiting to her some recently imported goods of the latest fashion, or by informing her that some new article was found to be exceedingly useful in domestic arrangements. They regarded a commercial transaction in the light of a mutual accommodation. They believed that the wares they had to sell were good, but were by no means prepared to pledge themselves that the world could produce no better; as they purchased, their customers were welcome to buy again, with the understanding that the sellers were not losers by the bargain.

Onslow and Son seemed to pride themselves that they could perform the least amount of labour in the longest given time. Their shop was open from six in the morning till ten at night. Everything was managed in a quiet, methodical manner, as though the chief aim of a tradesman was not the amount of work he could accomplish, but the number of hours he could manage to keep himself occupied. Had any one hinted to Mr. Onslow that he might have discharged double the amount of business, and have had full five hours a-day for exercise and instruction, he would have been plainly told that the best exercise for a man of business is his work, that a knowledge of reading, writing, and accounts is all that he requires; and as for Cassell's "Popular Educator," it would have been Mr. Onslow's decided opinion that it was only calculated to bring young men to poverty and ruin. The good man would have chuckled at the idea of a grocer learning Latin and French, or of a draper's assistant becoming master of the problems of Euclid. He would have deemed a voyage to the moon quite as probable as a monster trip to the Great Exhibition.

Things went on in such an established and regular manner in our street, that no one ever thought of any change. In the course of time, however, a circumstance occurred, the result of which was an entire topo-revolution. This was no other than the death of Miss Dorothy Bragge, an elderly lady, who lived opposite to the establishment of Onslow and Son. As soon as the funeral was over, the quiet, unobtrusive-looking dwelling, lately occupied by that lady, was "to let." Everybody wondered for a while whether the executors would be likely to find a tenant who would consent to be imprisoned in the same manner as Miss Bragge and her single domestic. Time, however, rolled on, and the empty house was almost forgotten, till one morning a number of joiners and bricklayers were seen to enter the premises, who, by their proceedings, were intent on making some considerable alterations. They deliberately proceeded to remove the window which had formerly afforded light to Miss Bragge's parlour; they then tore away the wall from the whole front, as high as the second floor, removed the partitions which had separated the parlour from the passage and the kitchen at the back, so that the entire suite of apartments on the ground floor was thrown open to the gaze of the public. The floor was scrupulously made level with the street, a commodious window of plate-glass was soon fixed, a long line of counters was arranged through the entire length of the shop—for a shop it was now about to become. Two dozen highly varnished canisters, the first numbered 12 and the last 36, were soon placed in regular order. Vast heaps of tea and sugar appeared to have been thrown into the window as samples, as if the shopman had just emptied a chest of the one and a barrel of the other, and thought nothing of them in a concern so extensive and magnificent. In the evening, a strong glare of gas-light forcibly arrested the attention of the passers-by; whilst invitations, printed in large characters, were adroitly placed in the window, strongly advising the reader to purchase a certain full-flavoured black tea, at four shillings per lb., or informing him that the finest fresh-roasted coffee was to be purchased at two. Spices were profusely scattered about, large bunches of grapes were temptingly suspended, Portuguese onions peeped slily from their bursting boxes, whilst oranges and lemons were so plentiful, one might have imagined that they grew in the neighbourhood. Within the shop every one was busy, even if there happened to be no customers waiting: one weighed and folded the articles which were likely to be soon required; another was unpacking or clearing away the goods which had just arrived; a third was seated at the desk, making entries in a book which appeared large enough to have kept the accounts of the nation. The whole scene was one of activity and despatch.

This change, so entirely new in our street, was brought about by Tom Widdaker, late apprentice in the firm of Onslow and Son, who, on the fulfilment of his indentures, had repaired to London, where he obtained a situation, and remained during five years as assistant in one of the largest metropolitan establishments. On the death of his father, Widdaker became possessed of £1,500; with this sum, and £150 which he had saved in London (N.B.—his evenings were usually spent in Southampton-buildings), he started business in the manner we have described, and ventured to oppose his late master, whose capital was known to be at least £12,000.

The walls of our town, and every available space in the surrounding villages, were covered with large placards, setting forth that "T. Widdaker, having *direct communication with the merchants of Hong Kong and the West Indies*, and by means of an *immense* capital invested in trade, was enabled to supply the public with Tea and Coffee, much superior to those of any other house, and at *exceedingly* reduced prices."

When the first feelings of surprise and astonishment had passed from the mind of every individual connected with the firm of Onslow and Son, the senior partner affected pity for what he considered the rash behaviour of his late apprentice; for that Widdaker would soon be ruined, Mr. Onslow did not entertain the shadow of a doubt.

"Who will believe his puffing advertisements?" said Onslow to Son; "and as for his capital, we shall soon see how far that can support such an extravagant outlay."

Now, although few persons believed that Widdaker had direct communication with the Hong Kong merchants, or that his capital was much beyond its actual value, the great bulk of the customers in our street soon began to resort to the "new shop." Many persons were of opinion that the tea and coffee purchased there were superior in flavour and quality to those of Mr. Onslow, and every one knew that the younger trader was content with more moderate profits. The *élite* of the parish were pleased by the promptitude and attention with which they were served, and the poor were influenced by the civility and politeness with which their custom was acknowledged. Thus the new shop continued to prosper.

Onslow and Son were obliged to acknowledge that Widdaker's term of existence as a shopkeeper in our street was likely to prove longer than they had at first anticipated; but they still persisted in the belief that his ruin was only put off for a season, and that the longer the event was postponed, the more fatal would be the catastrophe. In the mean time, as their drapery and drug business was not affected, it was sufficient to support them till the former state of things should be restored. But, alas! when changes have begun, who can say where matters will end? In a few months Browne opened a draper's shop in our street, on a similar scale to that of Widdaker; and Robinson started as a regular

druggist. Onslow and Son, however, still continued to believe that theirs would again become the only shop in the neighbourhood, and that these upstarts would soon vanish.

In process of time the young tradesmen married, and were surrounded by families, and still, to the astonishment of the Onslows, continued to manifest all the outer signs of men in easy circumstances. Widdaker was chosen to serve the office of mayor; Browne was elected churchwarden; and Robinson's ruin seemed to be as distant as ever.

At length, as the early-closing system was adopted in our street by all except the firm of Onslow and Son, a meeting of the inhabitants was called, to consider the propriety of establishing a literary institution, to which all parties, principals, assistants, and apprentices, might repair after business hours, for rational amusement and instruction. The object was approved of, and it was resolved that a site should immediately be sought out, on which to erect a hall for the purpose.

On the evening of that day, Onslow and Son settled their last transaction as members of a commercial firm.

"Sam," said Onslow to Son, "the world is gone mad. The sooner we are out of business the better. In a quiet cottage in the country we may, at least, live in peace."

A few weeks later, Onslow and Son deserted the home of their fathers, on which the "Athenæum" is now erected. But although seven years have passed away since that event, it is still the unalterable opinion of George Onslow, Esq., of Broom Cottage, that we are on the eve of a revolution, a national bankruptcy, or a foreign invasion, and that these calamities are mainly owing to such changes as have been wrought by the hand of Time in the condition of our street.

JAPAN AND THE JAPANESE.

The world was once a world of mysteries. Ancient maps were extraordinary-looking things, and modern maps of what the ancients knew are odd-looking skeletons, with a hand, perhaps, and a foot just covered by flesh, and all the rest mere outline. Country after country has been added, town after town; and once, to the amazement of the whole thinking universe, a whole continent came forth, unexpectedly, from the night of ages. And now America is peopled, India is a British province, islands like Australia are paving the floor of new empires, China is yielding up its secrets, and Japan, almost alone of those countries we wish to know, remains to a certain extent a sealed book. Precisely because it *is* a sealed book—because everybody has not an opportunity of knowing all about it—is that amount of curiosity developed which usually marks the inquiring mind. It is the sure result of some little reflection on foreign countries, and some little insight into books of travels in our youth, to make us in after-life eager students of geographical discovery. For our own parts, we believe that there is no style of reading more advantageous to the young mind than good books of travels. It arouses a habit of comparison; the variety of manners, ideas, thoughts, feelings, the host of prejudices peculiar to each nation, which are thus arrayed one against the other, must operate in a beneficial way upon the mind. By a knowledge of other lands, we learn to know better how to value what we ourselves possess.

There is no country about which we can inquire with more likelihood of our curiosity being gratified than about Japan. It must not be supposed that it has always been so hermetically closed: its present habit of seclusion dates from 1640, when the Portuguese were expelled, and Christianity, which was taking rapid root, was put down. The Portuguese Jesuit missionaries were at first well received, and favoured by the Japanese government; nor were they driven away by force of arms until they had begun to interfere with political affairs. A general massacre then ensued, stimulated probably by the Dutch, who ever since have been the only European people allowed to trade with Japan. The tale has been handed down to us by the Dutch of a certain yearly cursing and trampling upon the emblem of Christianity—the cross—by the Japanese. The statement, however, appears to be utterly devoid of foundation; indeed, the Japanese are rather exempt than otherwise from religious fanaticism.

Since the above expulsion, only one Chinese and one Dutch factory have been allowed. The interior has, then, been to a certain extent a great mystery, and yet, despite every care and precaution, truth will peep out. Medical men connected with the Dutch factory have written, and their books, with Japanese manuscripts, supply much information. We ourselves have the pleasure of constant correspondence with a relative in Batavia, who, from ex-members of the Dutch factory, has gleaned many useful facts. It is through Batavia, or Java, that all intercourse with Japan is carried on.

Some persons imagine that a stray junk of these strange people helped to people America, which, as there is no proof to the contrary, is quite possible. They, however, did not take, as far as we can see, any of their customs with them, unless, indeed, they be buried in the ruined cities of Yucatan, or in the graves of the Aztecs.

The aspect of the shores is gloomy, as if nature vied with man in her efforts to make the land inaccessible. Rocks, reefs, storms, fogs, are even more pestilential than the extreme *octroi* principle which the Japanese adopt, and which is so offensive even in the city of Paris. But as you approach nearer, you find before your eyes fresh green hills, richly cultivated in terraces, with cedars, and temple roofs and huts rising in all directions. The inhabitants first seen are generally fishermen, all but naked; but the ship which enters Nagasaki Bay has soon other visitors. The guards come alongside, questions are asked, delays incurred, Bibles and Prayer-books sealed up as dangerous, and hostages taken,—the whole crew and passengers examined to see that they really are Dutch; and then the ship is towed into the inner anchorage. From this place the view is delicious; hills, groves, oaks, cedars, laurels, corn-fields, gardens—all combine to attract and please the eye.

Immense precautions are now taken to prevent smuggling, which, nevertheless, does take place, though all efforts, even on the part of the president of the factory, to have the society of a wife allowed, have hitherto failed. The first thing that strikes the eye of the traveller is the appearance of the people he visits. A learned writer thus dilates upon them:—

"The Japanese have all the organic characteristics of Mongol conformation, the oblique position of the eye included; but they seem to be the least uncomely of that ugly race. Klaproth considers the Chinese portion of their nature to be happily modified by greater energy, muscular and intellectual. They are generally described as well made, strong, alert, and fresh-coloured; the young of both sexes as smooth-faced, rosy, and graced with abundance of fine black hair. The Dutch writers, indeed, dilate complacently upon the beauty of the young women, of which a specimen is given in a portrait in Siebold's work."

Our engraving represents a specimen (p. 389) of a Japanese lady in all her finery. To continue:—"The gait of both sexes is allowed to be awkward; and the women the worst, in consequence of their bandaging their hips so tightly as to turn their feet inwards. The ordinary dress of both sexes, and all ranks, is in form very similar, differing chiefly in the colours, delicacy, and value of the materials. It consists of a number of loose wide gowns, worn over each other; those of the lower orders made of linen or calico—those of the higher, generally of silk, with the family arms woven or worked into the back and breast of the outer robe; and all fastened at the waist by a girdle. The sleeves are enormous in width and length, and the portion that hangs below the arm is closed at the end to

answer the purpose of a pocket, subsidiary, however, to the capacious bosoms of the gowns, and to the girdles, where more valuable articles are deposited; amongst these are clean, neat squares of white paper, the Japanese substitutes for pocket-handkerchiefs, which, when used, are dropped into the sleeve, until an opportunity offers of throwing them away without soiling the house. This description applies to both sexes, but the ladies usually wear brighter colours than the men, and border their robes with gay embroidery or gold. Gentlemen wear a scarf over the shoulders; its great length is regulated by the rank of the wearer and serves in turn to regulate the bow with which they greet each other, inasmuch as it is indispensable to bow to a superior until the ends of the scarf touch the ground."

Their holiday garb is thus described:—"To the above, upon occasions of full dress, is superadded what is called the garb of ceremony. It consists o a cloak of a specific form thrown over the other clothes. With the cloak is worn, by the higher classes, a very peculiar sort of trousers, called *hakhama*, which appears, both from the description given, and from the appearance of the article, so far as can be distinguished in the glass cases of the Hague Museum, to be formed of an immensely full-plaited petticoat, sewed up between the legs, and left sufficiently open on the outside to admit of free locomotion."

Swords are the insignia of rank. Men in the higher ranks wear two, those a rank lower appear with one; the people are not allowed any. The figure we have engraved below is that of a nobleman, and accordingly, as the reader will observe, two swords are represented. This may give some idea of the character of political society. Socks are worn in-doors, their shoes being exceedingly awkward. They are soles of straw-matting or wood, kept on by an upright pin between the toes, sometimes by a horn ring. The impossibility of lifting a foot thus shod in walking may amply account for the awkward gait of the Japanese.

JAPANESE NOBLEMAN.

Their head-dress is distinctive. The men shave the front and crown of the head; the hair growing from the temples and back of the head is gathered together, drawn back, and forms a tuft. These peculiarities are faithfully depicted in the accompanying illustration. Priests and physicians shave clean, while surgeons retain theirs.

The women, exhibiting in this even more sense than the men of civilised countries, keep all their hair, and make a

kind of turban of it, stuck full of bits of tortoise-shell, a foot long, as thick as a man's finger, highly worked and polished. The more a lady's hair projects, the more she is dressed. No jewellery adorns their persons, the complexion is destroyed by red and white paint, the lips are daubed with purple, while the married women dye their teeth black and extract the eyebrows.

Except in rainy weather, the head is uncovered, a fan only shading off the sun. Everybody wears a fan,—man, woman, and child, soldiers, civilians, schoolmasters—every body.

The island inhabited by the Dutch—which is about 600 feet long by 240 across—is an artificial island in the shape of a fan, separated from the town by a stone bridge. The eleven solid Dutchmen who dwell here, are watched with all the patience of the strange race they do business with. They are waited on by Japanese servants in the day, but the severe laws which force these men to leave at sunset have encouraged the introduction into the factory of a class of women of the lowest order, who alone are allowed to live on Dezima island. The children of these temporary wives are all taken as Japanese citizens, and are allowed little intercourse with their parents. None may die on this Dutch island, and this law occasions some painful scenes in case of sudden illness. Few visitors ever go to Dezima, a permission being so difficult to obtain as to amount almost to prohibition. No money transactions are allowed, and the severe laws of the monarchy are kept in force by a system of spies, quite equal to that of any European despotism.

President Meylan thus describes a visit paid to him by the chief police officer, a burgomaster of Nagasaki: "Upon such occasions the president is bound, in expectation of their arrival, to spread a carpet, to provide liqueurs and sweetmeats to be offered at the proper time, to await the high dignitary at his own door, and when the said high dignitary has seated himself in Japanese fashion, on his heels on the carpet, to squat himself down in like manner, bowing his head two or three times to the ground, and thus making his compliment, as it is termed here. In all this I should see nothing, it being the usual mode in which Japanese grandees receive and salute each other; but here, in my mind, lies the offence, that between Japanese this compliment is reciprocated, whilst at an interview between a Netherlander and a Japanese grandee of the rank of a *gobanyosi*, the compliment of the former is not returned by the latter, he being esteemed an exceedingly friendly burgomaster, or *gobanyosi*, who even nods his head to the Netherlander in token of approval. All this is the more striking to the Netherlander newly landed at Dezima and not yet used to the custom, because he observes the Japanese to be amongst themselves full of ceremony and demonstration of politeness, in which the nation yields to no other, not even to the French."

JAPANESE LADY.

PEERS AND M.P.'S;

OR,

LORDS AND COMMONS.

SCENES IN THE COMMONS.

The scenes we have already given have been of an exciting and painful character. They were enacted by men whose passions were roused when great principles were at stake—when men had to contend for life, and liberty, and all they held dear. That battle over, the tone of parliamentary life has of course been lower. Party warfare has since raged high; the lame, and the blind, and the old were brought up to vote against Walpole; and during the debates on the Reform Bill, morning had long dawned before members had ceased to harangue on the bill they deemed so great a blessing or curse. On one occasion, we are told, Sheridan divided the house nineteen times. During the Reform Bill, Sir C. Wetherell kept dividing the house all night. But these contests were tame indeed, compared with those which we have already witnessed. When on one side was a king fighting for his prerogative, and on the other a democracy fighting for its very existence, a grandeur attached to the parliamentary arena such as it never had before, nor ever can be expected to have again. Our concluding scenes will be of a lighter character. Conversant as we are with the house as it exists at present, we have witnessed nothing deserving the name of a scene. Mr. Gavan Duffy last session managed to create a short-lived hubbub by making some rather strong remarks; but that was soon over, and the Duffiad at no time rose to the dignity of the scene.

When there is a row, you generally find an Irishman in it. O'Connell was famous for this sort of thing. On one occasion, when a vote for Maynooth was being discussed, Mr. Shaw, the member for the University of Dublin, having charged the member for all Ireland with attempting to subvert the Irish Church Establishment, Mr. O'Connell rose, and with the greatest warmth and violence of gesture, said, "I call the honourable recorder to order; he has made use of a false assertion."

Here Mr. O'Connell's voice, says the author of "Random Recollections of the House of Commons," was drowned amidst the deafening cries of "Order," which proceeded from all parts of the opposition side of the house. A number of honourable members rose at once and accompanied the words with a corresponding violence of gesture. Mr. O'Connell resumed: "The honourable member has accused me of having sworn one thing and done another. It is quite out of order for a member to utter falsehoods." Here the excitement became more furious still. In vain did Mr. Bernal endeavour, as chairman, to restore order. His voice was lost amidst the deafening noise which prevailed. Some degree of quiet being at length restored, Mr. Shaw rose, and with great warmth said, "The honourable member for Dublin knows that when he used the word falsehood—" Here Mr. Shaw's voice was again drowned amid renewed uproar and confusion. Seven or eight Irish members were speaking at the top of their voices. At length, Mr. Bernal having threatened to dissolve the committee, Mr. Shaw was allowed to resume, which he did by saying: "The honourable member, Mr. O'Connell, has charged me with being actuated by a spiritual ferocity; but my ferocity is not of that description which takes for its symbol death's head and cross bones." (Tremendous cheers from the opposition, with uproar from Irish members on the ministerial side.) Mr. O'Connell, addressing himself personally to Mr. Shaw, and not to the chairman, "Yours is a calf's head and jaw-bones." (Deafening cheers from the ministerial side of the house, mingled with cries of "Order! order! chair! chair!" from the opposition.) This was the climax. Mr. Bernal at length interposed, and order was again restored.

We take from the *Morning Post* of 28th of July, 1835, a very graphic account of a scene which ensued when Mr. Hughes, a new member for the city of Oxford, rose to address the house. The moment he pronounced the word "Sir," addressing himself to the Speaker, he was assailed with the most tremendous uproar and confusion. The most confused sounds, mysteriously blended, issued from all corners of the house. One honourable member near the bar repeatedly called out, "Read," to the member endeavouring to address the house, in an exceedingly base and hoarse sound of voice. At repeated intervals, a sort of drone-like humming, having almost the sound of a distant hand-organ or bagpipes, issued from the back benches,—coughing, sneezing, and ingeniously extended yawning, blended with other sounds, and produced a *tout ensemble* which we have never heard excelled in the house. A single voice from the ministerial benches imitated very accurately the yelp of a kennelled hound.

In 1834, when the question before the house was the admission of Dissenters to the Universities, the following scene occurred, taken from the *Morning Chronicle* the day after. Mr. G. W. Wood rose to reply (the laughing, jeering, shouting, and coughing were such as we never before witnessed). The hon. gentleman said it had been declared that the bill in its present stage was essentially different from what it was when he had the honour to introduce it. (At this moment two hon. members, o'er all the ills of life victorious, suddenly entered from the smoking-room into the opposition gallery, and stretching themselves at full length, secure from the observation of the Speaker, commenced a row of the most discreditable character.) This he denied ("I say, can't you crow?") (laughter and uproar); the provisions had not been altered ("Hear him, how he reads!")—the enactments were in every way unaltered (loud cheering followed by bursts of laughter). The question was ("Read it—read it," and great uproar), the question was ("Just so—read it), the question was (great cheering and laughter), whether the universities should be open to all, or be for ever under the control of mere monopoly ("Where's the man what crows?" Laughter, and cries of "Order" from the Speaker). Public opinion ("Order," and great uproar, during which the Speaker, evidently excited, was loudly calling for "order!" The scene here was indescribable).

Mr. Grant gives another scene, occurring during the same session: "An honourable member, whose name I suppress, rose amidst the most tremendous uproar to address the house. He spoke and was received, as nearly as the confusion enabled me to judge, as follows:—'I rise, sir (ironical cheers mingled with all sorts of zoological sounds); I rise, sir, for the purpose of stating that I have ("Oh! oh! Bah," and sounds resembling the bleating of a sheep, mingled with loud laughter)—Honourable gentlemen may endeavour to put me down by their unmannerly interruptions; but I have a duty to perform to my con——(ironical cheers, loud coughing, sneezing, and yawning extended to an incredible extent, followed by bursts of laughter). I say, Sir, I have constituents that, on this occasion, expect that I (cries of "should sit down," and shouts of laughter)—they expect, sir, that on a question of such importance (O-a-a, and loud laughter, followed by cries of "Order" from the Speaker)—I tell honourable gentlemen, who choose to conduct themselves in such a way, that I am not to be put down by—(Groans, coughs, sneezing hems, and various animal sounds, some of which closely imitated the yelping of a dog, and the squeaking of a pig, interspersed with peals of laughter). I appeal ("Cockeleerio"—the imitation in this case of the crowing of a cock was so remarkably good, that not even the most staid and orderly members in the house could preserve their gravity. The laughter which followed drowned the Speaker's cries of "Order, order")—I say, sir, this is most unbecoming conduct on the part of an assembly calling itself de——("Bow-wow-wow," and bursts of laughter). Sir, may I ask honourable gentlemen who can—("Mew, mew," and renewed laughter). Sir, I claim the protection of the chair. (The Speaker here again rose and called out 'order, order,' in a loud and angry tone, on which the uproar in some measure subsided.) If honourable gentlemen will only allow me to make one observation, I will not trespass further on their attention, but sit down at once. (This was followed by the most tremendous cheering in earnest.) I only beg to say, sir, that I

think this is a most dangerous and unconstitutional measure, and will, therefore, vote against it.' The honourable gentleman then resumed his seat amidst deafening applause." Happily these scenes now have altogether ceased. This may make a night in the house less amusing than formerly; but you have the satisfaction of feeling, that the business of the house is better done; and if we want low buffoonery, we can go for it now to the Cider Cellars.

PARLIAMENTARY ORATORS AND ORATORY.

It is very clear that whatever privileges parliament gives up, that of speaking will be the last resigned. The rage for speaking becomes greater every day. Unfortunately, also, the ability for a certain style of popular speaking advances at the same rate. In a little time we may expect to find parliament sitting all the year round, for every member now must have his say. About a third of the house consists of lawyers; these men are bound to speak, else how are their merits to be known? Then, again, every constituency expects its members to shine in the house. Why should Little Peddlington go out of its way to return Jenkins, unless Jenkins lets the house know that the people of Little Peddlington will stand no nonsense; that they will listen to no childish subterfuge nor base compromise; that they are for the bill and nothing but the bill? The talk of the house thus becomes interminable. As soon as Wishy sits down, Washy gets up. True, no one listens; but then the reporters are in the gallery taking down all the wretched verbiage, and printing it next day for the benefit of the world. The abolition of the reporters' gallery would soon put a stop to much of parliamentary oratory, and would certainly much improve the character of what would remain.

One thing is very clear, that modern oratory has not much improved. Some attribute this to the Reform Bill. We don't think that is correct. The Reform Bill may have introduced a few bad speakers into the house, but there were bad speakers in the house before the Reform Bill was thought of, and there will be bad speakers in the house when the memory of the Reform Bill shall have passed away. We lay the blame of much of this feeble oratory to the reporters' gallery. Before that existed, to know what was going on, members were obliged to be in their places. Thus at once a good audience was created, and the orator had but to speak, and was recognised at once. Now, if a man merely keep on his legs, that is all; the house does not listen. Every one knows it will be in the *Times* the next morning, and thus the house does not make the wretched man sit down. It is lenient, and allows him to drone on. Any man who can commit a speech to memory and deliver it is a parliamentary orator now. If he sticks, the public does not know it. The speech is well reported, polished up in the process, and reads fluently enough. It was not so in the days of Bolingbroke, of Pulteney and Walpole, of Pitt and Fox, of Brougham and Canning. The real orator then had a chance. He spoke to the flower of the aristocracy—of the landed gentry—of the universities; and every gesture, and every stroke of satire and of wit, and every burst of passion or indignation, found a ready response. To be an orator then was to be everything. When Pitt the elder first spoke in the house, Walpole trembled, and considered how he could best win over the young cornet to his side. The same power of public speaking made Pitt prime-minister, when other men have scarcely won a provincial name. It lifted Burke into a cabinet. It made Sheridan the companion of princes. It placed Canning on the pinnacle of power. Such an audience had grown fastidious. No man could win it who was not great in oratory. Only the names of the few orators were heard; those of the others were never mentioned. Now educated mediocrity has almost an equal chance with talent, with genius, with oratorical power. The press puts them all on a common level. It exalts the humble, it abases the proud. It does this because it can merely give the words—the dead carcase, not the living and animating soul. You miss the look, the accent, the emphasis, the action; all that made the speech what it was; all that which the real orator has, which the spurious one never can attain. The age now reads, not listens. Hence, everywhere oratory declines. The falling off is not merely in the House of Commons, but in the pulpit and at the bar. Nowhere has the orator the room and power he had. His day is wearing out. He belongs more to the past than the present or the future. Oratory now is of a business character. The house meets to discuss business details. Every day it becomes less an imperial senate—more a parish vestry.

No one who has at all studied the speeches of parliamentary orators, past and present, can doubt the change which has taken place in the character of parliamentary orators. In his "Life of Sheridan," Moore very properly remarks, that "the great increase of public business since that orator's time has necessarily made a considerable change in this respect. Not only has the time of the legislature become too precious to be wasted, but even the graces with which true oratory surrounds her statements are but impatiently borne where the statement itself is the primary and pressing object of the hearer." The great men of other days would have to alter their style now. No man can fight against the taste and sense of the house. Sheridan's first style was very bad, and he had to alter. In our own times we have seen Disraeli do the same. Men who have gone into the house late, too old to learn the true parliamentary style, have thus often failed, though they may have acquired considerable reputation out of doors. There are some who lay much stress upon the favourite beverages of parliamentary orators. We believe, however, this has very little to do with the question; though Lord Campbell, in his "Lives of the Chief Justices," does suggest that there might be a curious chapter in a treatise "De Claris Oratoribus," on the mode of their preparing themselves physically. Sheridan could not speak without a pint of brandy; and a celebrated speech in the House of Lords is said to have been inspired by mulled port. One of the greatest orators in the House of Commons is most powerful and imaginative after eating a pound of cold roast beef and drinking a quart of small beer; while it is a well-known fact, that the finest speech of the younger Pitt was delivered immediately after a fit of vomiting. Some recommend tea; some, camphor julep; and one orator, that he may electrify his audience, as often as he is going to speak, repairs to the Polytechnic, and receives several shocks from a Leyden jar. We live now in an age of temperance. Orators drink more seltzer water and less fiery port. This may in some degree account for the dry business tone which prevails in the house. If parliament be a place of business, it may be thought, after all, that the modern style is better fitted for it than the style of our great orators, modelled upon those of Greece and Rome. Public speaking among the ancients, says Lord Brougham, in his "Dissertation on the Eloquence of the Ancients," bore a more important share in the conduct of affairs, and filled a larger space in the eyes of the people, than it does now, or indeed ever can again. Another engine has been invented for working upon the popular mind,—whether to instruct, to persuade, or to please—an engine, too, of which the powers are not limited either in time or in space. The people are now addressed through the press; and all persons whatsoever, as well as those whom the bounds of a public assembly can contain, are thus brought in contact with the teacher, the statesman, and the panegyrist. The orator of old was the parliamentary debater, the speaker at public meetings, the preacher, the newspaper, the published sermon, the pamphlet—all in one. Any attempt to combine so many functions in the person of a speaker would be monstrous in the present House of Commons. But it is no proof that oratory has declined, simply to state that speeches are less classical now than they were in the days of Pitt and Fox. It is said that the Reform Bill, by introducing more uneducated men into the house, has lowered the character of its oratory. The remark we have extracted from Mr. Moore shows that the same complaint was made before Reform had become a fact. The real truth is, more business is done in the house now than was ever done before, and hence the speaking in the house is of a more business character than it ever was.

EVENING.

The painting from which our engraving is taken is by a contemporary German artist. Herr Meyerheim has presented us with a thoroughly home picture; and although, as is sure to be the case, German peculiarity may be detected in the trailing foliage and the outline of the figures, there is something so homely, plain, and simple in the composition, that it deserves the attention of all. It is evening, and the rays of the setting sun are falling on the casement; the labour of the day is over; the birds are roosting in the trees; the cattle are at pasture; and the peasant has returned to his home, and in calm enjoyment looks on his smiling wife and happy group of children.

It is a home picture, and there is a charm about home which we all understand. "We bear," says one, "our penates with us abroad and at home; their atrium is the heart. Our household gods are the memories of our childhood—the recollections of the hearth round which we gathered—of the fostering hands which caressed us—of the scenes of all the cares and joys, the anxieties and the hopes, the ineffable yearnings of love, which made us first acquainted with the mystery and the sanctity of home."

No matter where that home is; whether it be in some crowded city street, or pleasant country town; a small fishing cottage, peeping from a thick and gloomy copse of firs and larch and oak; or whether it be some stately baronial mansion, whose corridors have echoed to the footsteps of royalty, whose walls have laughed a siege to scorn, and whose name figures in history; if it be our home, it is very dear to us—dearer than all the world besides.

Bulwer says: "I was touched once in visiting an Irish cabin, which in the spirit of condescending kindness the Lady Bountiful of the place had transformed into the graceful neatness of an English cottage, training roses up the wall, glazing the windows, and boarding the mud floor;—I was touched, I say, with the homely truth which the poor peasant uttered as he gazed half-gratefully, half-indignantly, at the change. 'It is all very kind,' said he, in his dialect, which I am obliged to translate; 'but the good lady does not know how dear to a poor man is everything that reminds him of the time when he played instead of working—these great folks do not understand us!'"

"Do not run much from home," says that charming writer Miss Bremer; "one's own hearth is of more worth than gold."

EVENING.

Everything about the picture of Herr Meyerheim is perfectly in keeping. The air of quietness and repose that is seen in the lounging figure of the man, as he leans over the opened hatch and watches his children at play, is found also in the mother sitting in the sunshine, and in the little one who nestles on her bosom, while the creeping plant on the trellis is not stirred by a breath of wind. The only active part of the group is formed by the boy and the kittens; he has a plaything and is amusing himself and his playmates with it, watching with the keen glance of a hunter the movements of the young cats. Doubtless, that anxious look, that eager look, indicates a curiosity which, if properly developed, may stimulate the boy to work and study; but badly directed, may make him a treacherous and cruel man.

BATTLE ABBEY.

BATTLE ABBEY.

Some eight hundred years ago an invading army landed on the British shores. In a few days it was met by men who would have driven it back, had Saxon bravery been a fitting match for Norman guile. The cause of the quarrel need not be told here. As usual, the sacred name of religion was invoked, and her sanction was attributed to acts which the God of religion could never approve of. Early in the autumn morning marched the Normans up the hill, on the top of which was gathered the Saxon host. The place bore an appropriate name. It was called Senlac, a term, in the language of those times, indicative of blood. Harold, the last of the Saxon kings—for it is he of whom we write—posted his host in one compact mass and thus awaited the Norman charge. In the centre waved the royal standard—the figure of a warrior in the act of fighting, worked in thread of gold and ornamented with precious stones. The papal banner waved over the Norman ranks; on they came, a stalwart mass—infantry and cavalry—charged and reeled, and retired and charged again. Evening drew on, and still the English battle-axes dealt death around. But they were to be used in vain that day. Confusion severed their ranks—a random arrow struck their leader, and he fell. Of the sixty thousand that had come there that morning to conquer the invader, only one-quarter left the field at eve. Even the last of the Saxon kings would have lain unhonoured and unburied on that field of blood, had not the woman whom he loved searched amongst the dead till she found what once she fondly called her own. The result the world knows. A Norman duke became an English king, and free lands were the rich rewards of all who had followed the Norman warrior across the sea.

In accordance with the spirit of the age, William had vowed to erect a religious building if victorious. Heaven, as he deemed, having heard his vow, Battle Abbey rose upon the very field where the body of Harold had fallen in a glorious cause. The high altar was placed upon the very spot. The foundation was to have been much larger than really proved to be the case. William meant to have had one hundred and sixty monks lodged there; the number in reality was sixty, and they at first were brought from Mormoustier, in Normandy. The Abbey was dedicated to the Holy Trinity and St. Martin. It had immense privileges. It was exempted from episcopal jurisdiction. It had the right of free warren in all its manors, treasure trove, and even sanctuary. The country round was freed from every kind of tax and service; besides, it was richly dowered with goodly manors and churches in Sussex, Kent, Surrey, Berkshire, Oxfordshire, Devonshire, Essex, and even in Wales. The first abbot was appointed in 1076; the monastery was not completed till 1094. It was left to William's descendants to finish the work which he had begun. His son Rufus was present at its consecration and added to its endowments. The other kings of the same line did the same. Battle Abbey was a favourite one; it was founded by a monarch, and succeeding monarchs cherished it. With every reign it had a fresh grant. When the English constitution began to evolve itself, its mitred abbots sat in parliament. All cockneys are familiar with the name of Battle Bridge; that name is connected with the abbey. Stowe says: "The Abbat of Battel Inn in London was so called of Battel Abbey, for that it standeth on the ground and over a water-course flowing out of the Thames, pertaining to that abbey, and was, therefore, both builded and repaired by the abbats of that house as being hard adjoining to the abbats' lodging."

The ruins of Battle Abbey bear ample testimony to its ancient magnificence. Their circuit is computed at not less than a mile. Gough, says Sir Anthony Browne, bought the site of a previous grantee. What his son, the first Lord Montague, built here is, he adds, now the most ruinous part of the abbey, being only a shell of a suite of rooms, at the south end, with two towers, at the east end, which were standing when Birche's view was taken in 1737, but are now down. The grand entrance, a large square building, embattled at the top with a handsome octagon tower at each corner, faces the town of Battle. It is supposed to be of the time of Henry VI. The ground-plot of the Abbey Church cannot now be traced; some of the arches of the west end of the cloister remain. The refectory, or abbey hall, above fifty paces long, had a carved roof of Irish oak, which, Mr. Gough says, was carried to Lord Montague's seat at Cowdray; the walls are now open at the top. There is another building, a little detached from the abbey, of the same kind, having twelve windows on one side and six on the other, presenting the remains of a room one hundred and sixty feet by thirty-five feet. The abbey kitchen had five fire-places, and was arched at the top, and, considering the large family maintained in the establishment, must have been the scene of extensive culinary operations. The monks could afford to live well. Their revenues yielded them an income of £10,000 a year.

That indefatigable antiquarian, Mr. Mark Antony Lomer, has published an interesting document, called "The Chronicle of Battle Abbey," which contains as much of the world's history as occurred within the abbey. Few monks knew much of the political contentions and wars which agitated society. They had their own duties to perform, and intelligence was far less rapidly diffused than in our day. The good chronicler, as a true Norman monk, never imagined for a moment that Harold, in fighting for the independence of his kingdom, was doing anything very patriotic or worthy of praise. The pious chronicler had quite a different opinion. This is clear from his opening paragraph, which is as follows:—"By that providence by which all earthly affairs are arranged, the most pious Duke William, of the illustrious stock of the Normans and of their famous Prince Rollo, a man worthy to be destined the father of his country, and the landmark of his duchy and kingdom, having arisen like a morning star upon the world—(through his admirable diligence, accompanied by God's favour, his own liberality, and the assistance of the nobility of France)—after innumerable storms of calamity, happily asserted his claim to the government, left him in right of heirship by his father, and at length effectually reduced it under his power. In the meantime, King Edward died, and left the kingdom of England to Duke William, whom he constituted his legal heir. But this was seized upon by a certain *perjured slave* called Harold, and the duke having received information of it, relying upon the advice and assistance of his friends, devoted all his energies, either by force or stratagem, to recover his rights. He, therefore, prepared himself a great fleet; and many counts, nobles, and illustrious men, who were not his subjects but belonged to neighbouring provinces, from motives of respect associated themselves in his retinue. The duke, therefore, setting sail with a prodigious army and attended by Divine favour, arrived safely near the castle called Pevensey."—But this is enough. The bias of the writer is clearly seen. Nor less remarkable is the writer's attachment to the abbey, in which we may imagine he led a very easy life.

One paragraph will demonstrate this. We read, in the time of William Rufus, that an importunate monk teased the king into giving him an order for ten pounds on the Exchequer of Battle Abbey, for the purchase of a vestment for a foreign abbey. The order, of course, was honoured; but mark the result. "The vestment was forthwith made, and no apprehension of God's judgment being entertained, all things appeared to have been satisfactorily performed; but suddenly, at a certain time, about the third hour of the day, the Lord thundered from the heavens, and the wonted calmness of the air was changed into thick darkness and as it were the shadow of death, and there arose a mighty tempest of lightning and thunder. As we have said, the third hour of the day had commenced, and the brethren were chanting the verse, 'Sharp arrows of the mighty,' when, on a sudden, the day assumed the horrors of dark night, and the trembling earth, shaken by the crashing of the heavens, seemed to rise beneath their feet.

All the brethren, fearing the lightning stroke from heaven, desisted from the occupation in which they were engaged, and prostrated themselves in prayer, and lo! in a short space two of the monks were deprived of their vital breath." The next year Divine displeasure was equally displayed. A thunderbolt from heaven pierced the unjustly-purchased vestment, and it was filled with "wonderful holes made in it by the fiery force of the lightning." Hence, observes the chronicle piously, "we may see the marvellous power of God towards the saints." Of the abbots themselves the chronicle has little to say. One Abbot Ralph was a rare abbot. "Ever first at the choir, he was the last to quit it. Thus was he a pattern of good works—a Martha and a Mary. He was the serpent and the dove. He was a Noah amidst the waters: while he never willingly rejected the raven, he always gladly received the dove. In the sparingness of his food he was a Daniel—in the sufferings of his body a Job—in the bending of his knees a Bartholomew." Besides such holy men, Battle Abbey seems also to have had other treasures. It boasted a sword and a royal robe belonging to William the Conqueror, both of doubtful authenticity. Leland has preserved the catalogue of the library. A short extract will not make the present generation regret that its contents are not accessible to the reading public:—

The Gloss of Odo, Abbot of Battel, on the Psalter.
Clement of Sautory on the Spiritual Wings and Feathers of the Cherubim.
The Entire Chronicle of Jordan, Bishop of Ravenna.
Mellitus on the Assumption of the Blessed Virgin.
Bede on the Distances of Places mentioned in the Acts of the Apostles.
Bishop Martin on the Four Cardinal Virtues.
Epistles of Ivo on the Body and Blood of Christ.
Abbot Odo: Exposition of the First Book of Kings.
Sermon of Stephen, Archbishop of Canterbury, on the Assumption.
Sermons of Richard of Melksham.
Sermons of Stephen of Canterbury.
Broker William de la Lees' Book of Chronicles.
The Responses of Albinus
Albinus on the Propriety of Sermons.
Topography of England and Wales, by Sylvester Giraldus Cambrensis.
The Entire Prophecy of Hildeyard.
The Summary of Michael de Straulfield.

Truly a wretched library; not a single classic in it. The English monasteries must have degenerated. When Alcium went to assist Charlemagne, he had his books from England. Certainly the learning of England had declined.

But we have yet to name what, in these modern times, is considered the most memorable thing in connexion with the abbey; that is the far-famed Roll of Battle Abbey—a document which all who pride themselves on their Norman lineage refer to as indisputable authority. The roll is a list of the adventurers who came over with William the Conqueror. It is a list of which the English aristocracy are proud. He whose name is there boasts himself of pure blood. He whose name is there boasts with a feeling of pardonable exultation that his is the honour of an ancient and unsullied line. It is questionable whether this is really the case. It is more than probable that the list has been tampered with, and that names which have no business there have been foisted in. Even if the list were genuine it would not be of so much consequence as some imagine. It is not birth alone that wins the world's homage now. The man we would honour must be better than his fellows—of nobler life, of loftier aim.

"Worth makes the man, and want of it the fellow;
The rest is all but leather and prunella."

The abbey was suppressed in Henry the Eighth's time, who granted it to Richard Gilmer, from whose hands it passed into the hands of Sir Anthony Browne. It is now the property of the Webster family. By means of its connexion with the Browns, the abbey has become associated with that unfortunate Earl of Surrey to whom we owe the introduction of the sonnet and blank verse. The second wife of Sir Anthony was the lady Elizabeth Fitzgerald, daughter of Gerald, ninth earl of Kildare, whose beauty, under the name of the "Fair Geraldine," Surrey "married to immortal verse." The love that gilded his troubled life still lives and shines, for time

"Makes all but true love old."

Our readers will forgive us if we tell them, as the noble poet sang—

"From Tuscan came my lady's witty race,
Fair Florence was some time their ancient seat.
The western isle, whose pleasant shore does face
Wild Cambria's cliffs, did give her lively heart

Fostered she was with milk of Irish breasts,
Her sire an earl, her dame of princes' blood;
From tender years in Britain she doth rest,
With king's child, where she tasteth costly food.

Hunsden did first present her to mine een,
Bright is her hue and Geraldine the hight;
Hampton me taught to wish her first for mine,
And Windsor, alas! doth chase me from her sight."

Thus Battle Abbey comes to us with no common claims. It has its tales of heroism—of bravery—of piety—of learning, and of love. We see it rising with prayer and praise amidst the slaughter of the battle-field. When the times came for mitred abbots and shaven monks to pass away, we see the old halls filled with the bravery and the beauty of that age. It is still to us a chronicle, and reads to us a sermon of change and decay. It does more. It shows how imperishable is human energy. The children of Rollo landed strangers on our shores. Here with their broad-swords and strong right arms they won themselves a home. They are gone, and the abbeys they built and endowed moulder away—but their spirit still lives; we see it in the energy which grapples with the elements and rules the waves, that has preserved Freedom here when the powers of Europe have conspired her overthrow, that has carried the English tongue into every corner of the globe, and that has made the banner of Old England float victorious over every sea.

THE SACRED DEBT.

SECOND PART.

To effect the object already specified, our four amateurs occupied themselves in preparations for their tour. They selected the finest airs of the opera, and the sweetest melodies of Germany, which they practised with great care, in order to bring their performance to the highest possible perfection. Ernest, the first violin, played with the skill of an artist, and his companions were not much his inferiors.

Before they set out, Ernest wished them to see the little farm which he had discovered. They accompanied him to the Pré Fleuri, and found that their friend had evinced no less taste than good sense in the whole affair.

He who had conceived the project did not share the joyous anticipations of his three companions. Ernest had consulted his mother before making his decision, and acknowledged with her, that the intended scheme, without being offensive either to God or man, was, nevertheless, a miserable expedient—a lamentable necessity.

"Beware, my son," said Catherine, "the life that you are about to lead will expose you to many dangers. Watch over yourself, make your harvest as quickly as possible, and return before the demon has tempted you. A wandering life is a perilous path. What sorrow for your poor mother if she

should have sanctioned what may bring shame and disgrace upon her son!"

She gave him much more advice, then with tears embraced her Ernest, and gave him her blessing. He could not bear to leave his mother so sorrowfully, and therefore begged his companions to begin their concerts at once. They willingly consented, and at midnight, before their departure from the town, they serenaded the good woman. Catherine, who was not asleep, immediately recognised her son's violin; she rose and opened her window, and when the musicians had concluded their first *allegro*, she ran to her little desk, and taking out a small coin, wrapped it in paper, held it to the lamp, and threw it burning to the young minstrels.

"Adieu! my children," said she, "here is the widow's penny—may it bring you a blessing!"

They commenced their campaign some leagues from thence. They went through Saxony, Bohemia, and part of Prussia; and everywhere met with a favourable reception. Their music was not sufficiently noisy to attract immediate attention, but its merit was soon recognised by good judges, and then every one crowded to hear them. In a little time they were noticed by the public journals, and they performed not only n the street, but also in drawing-rooms and casinos. Money was showered upon them, and they hoped soon to be in possession of the two thousand florins, which had been hitherto the height of their ambition.

Their hopes were more than realised, for at the close of a concert which they had given in the casino of a town of Prussia, they found that they had in their purse two thousand one hundred and forty-three florins.

Ernest then said to his companions: "The time for our return has arrived. Let us lay aside the two thousand florins, the surplus will supply our wants on the road."

The others were much displeased to hear him speak of returning. They had acquired a taste for this wandering life, and wished to enjoy it as long as possible. As they had been influenced only by frivolous motives in their desire to satisfy the old man, he was soon forgotten in the applause they received from town to town. It was not to be thought of, said they, until the end of the vacation. There were still fine cities to be seen, still some ducats to be earned which they could spend in pleasure.

While they thus disputed, a message arrived from a nobleman, requesting them to perform at a *fête* which he was about to give. Ernest, who had only yielded to necessity in turning his musical talents to account, replied that he would go willingly, provided no remuneration was offered. His companions murmured at this, but finally yielded to what they called his caprice, persuaded that the nobleman would amply recompense them, notwithstanding what Ernest had said; besides they promised themselves much pleasure at the *fête*, which it was said would be magnificent. Ernest took this opportunity of requesting that the two thousand florins should be committed to his care, that on no pretence whatever would they oblige him to spend a penny of it, and that they would allow him to seal the purse that it might be delivered unbroken to old Peter.

Thereupon his three companions loudly clamoured, and thought it a most extraordinary thing that he should wish to take possession of the common treasure.

"It is not the common treasure," said he to them; "it belongs neither to you nor to me. I do not wish to take possession of it; I merely ask to have the care of it, until it can be given into the hands of its owner."

"Must I swear that I will not touch it?"

"Do you take me for a thief?"

"No," replied Christopher; "but if you believe us to be honest men, why do you request to be made the sole depositary of what belongs to us all. Claim your own share, and no more. This is my advice, and if you all agree with me, we will divide it among us. Let each one speak for himself."

Augustus and Frederic warmly supported this proposal, Ernest was obliged to consent to it; he received a fourth of the whole sum, and could only tremble for the other portions.

The nobleman was surprised at the conditions attached by the young musicians to their promise of performance; his pride would perhaps have been a little offended, but he suspected something of the truth, and repeated his invitation. They appeared at the *fête*, and graced it with their performance. The master of the house, wishing to make them some acknowledgment, towards the close of the entertainment took them aside and presented them each with a ring set with brilliants.

"Are you not contented now?" said Ernest to his friends, when the nobleman had left them. "We could not carry home with us a more beautiful *souvenir* of our journey. I think you will now own that our work is accomplished. Let us return to our studies. Let us gladden our homes, and especially, let us quickly take to the old man what we have collected for him. Every moment of delay is criminal. It was I, dear friends, who persuaded you to the enterprise, and I am anxious to take you back again satisfied with yourselves. I trust I shall not be the occasion of disgrace to you."

They held this little conference in a small ante-chamber, whither they had withdrawn from the company. Ernest, leaning upon the balcony, waited the reply of his friends. Suddenly the sounds of a harp struck his ear; he looked over and saw some one pass under the windows of the mansion.

"It is he!" said Ernest; "see his white hair floating in the wind."

Some wandering tones were again heard, then the sounds were lost in the distance, and the figure disappeared in the shade.

"It is himself!" said Ernest again.

"Very possibly," replied Frederic, coldly; "there is nothing extraordinary in that. It is his profession. I am only surprised that we have not met him before in some of the towns we have visited."

"And should this meeting teach us nothing, my friends? God has sent the old musician to recall us to our duty. Allow me again to entreat you to fulfil it. Let us return home at once, my dear comrades. For myself I am determined. I go, even if I must go alone."

"There are the fireworks," said Augustus; "we do not want you, with your fine morals."

Saying this he drew Christopher and Frederic upon the terrace. Ernest was alone; he looked again into the street, and fancying that he could distinguish the figure of the old man, seized his hat and hurried out.

He ran after him, but either he had entered a house or had taken another road—Ernest could not overtake him; and after having gone over the town and having made inquiries at several inns without obtaining any intelligence of him, he returned to the lodging, where he expected to meet his friends after the *fête*. But he waited for them in vain—they did not return; and the next day he could hear nothing of them.

"Apparently," said Ernest, "they wish to separate from me; they fear my reproaches—my entreaties annoy them. It only remains for me to return and fulfil my promise as well as I can. Alas! I see the poor old man will never have the cottage."

Ernest turned his steps towards the town where his mother resided. Overcome with disappointment at the failure of his scheme when success seemed certain, and anxious for the fate of his companions, he was taken ill, and fell fainting at the door of a large hotel. Judging from his modest attire that he would not be regardless of expense, they carried him into a small upper room, where he remained some days confined to his bed. However, he soon began to recover; and one day feeling much better, and anticipating the happiness of soon again seeing his mother, he took his violin and played some of his sweetest airs, accompanying it with his voice. After a little time he was interrupted by the entrance of a servant, sent to him from a gentleman who was lodging below. At first Ernest imagined that his violin annoyed his neighbour, and was about to lay it aside; but the servant assured him that, on the contrary, it had given his master much pleasure.

"He has sent me," he added, "to express his thanks, and to beg that, if not disagreeable to yourself, you would open your casement, that he may hear it more distinctly."

The young amateur could not refuse to comply with so flattering a request. He seated himself near the open window, and played for about half an hour, when the domestic re-appeared, and said that his master begged to be allowed to pay Ernest a visit, or to receive him in his own apartments.

"Is he older than I?" inquired Ernest.

"My master is an old man."

"I will come down," said the student.

The gentleman, who appeared to be a man of rank, received him with kind familiarity, paid him some simple compliments on his talents, inquired after his health, and concluded by inviting him to dinner.

"I know," said he, "that you have been ill, and it will give me pleasure to celebrate your convalescence."

The stranger wrote his name on a slip of paper, and handed it to his guest with a purse of gold.

"His highness—" exclaimed the young man, rising in astonishment.

"Silence, my friend; I am travelling *incognito*. Sit down again, and let us take our coffee."

Ernest tried in vain to recover himself; he was no longer at ease; he bowed low on leaving the room, while his heart bounded with joy. With what care he deposited the precious treasure at the bottom of his pocket, lest some disaster should happen to the sum so happily re-completed.

The next morning, after having taken leave of the generous stranger, he set out again on his journey, and travelled as quickly as possible. On the third day, as he entered a little town, about nine o'clock in the evening, he heard, for the third time, the sounds of the harp, and soon recognised the beggar. He had almost embraced the old man, so overjoyed

ERNEST ACCOSTING THE OWNER OF THE COTTAGE.—DRAWN BY TONY JOHANNOT.

The affability of the old gentleman so won the heart of Ernest, that during dinner he related his adventures to his noble host. He had hoped to amuse him, and he succeeded; but he little suspected the interest he had excited.

"My young friend," said the stranger to him, when he had concluded, "your narrative has delighted and affected me; there is something so extraordinary in the thoughtlessness of your promise, and the wise firmness of your after conduct. Allow me to unite with you in this good work. I fear, with you, that your companions will return lightened of their gold and loaded with regret. Accept from me, then, the sum which is wanting to complete the purchase of the little estate. I make this offer without expecting to be repaid; but should fortune favour you and the obligation become burdensome, here is my name and address. You will not forget them, I hope, for it is my wish that we should be friends."

was he at thus meeting him; but he restrained himself, and determined to gain his friendship before making himself known.

A few children were gathered around the old musician; but the night was fast closing in, and the crescent moon almost touched the horizon. Its rays fell on the youthful form of Ernest as he approached, and said in a kindly tone,

"My father, two instruments will, perhaps, be more successful than one. Will you accept my assistance? I and my violin are at your service."

He had tuned it before the astonished old man was able to reply.

"You were playing the airs from Don Giovanni," said Ernest, taking his place beside him. "I know them nearly all. Will you accompany me?"

He immediately commenced, and the old man, almost in

raptures, accompanied him with the skill of an experienced musician.

Charmed with each other, they played marvellously, without noticing the crowd which soon collected around them. Windows were thrown open, and the little children kindly gathered up the money which was plentifully scattered about.

"This is what I am little accustomed to," said the poor old man, as he received the offerings, which he wished, yet dared not offer, to share with his young companion.

"You deserve a hundred times more than that, and will have it, I hope," said Ernest. "But where do you lodge, my master? for the night air is injurious to one of your age; and you also appear fatigued."

"I may well be fatigued, my dear sir; for to-day I am seventy years of age. Your violin has celebrated my birthday. I little expected to close it so happily; but God be thanked for it!"

THE PURCHASE OF THE COTTAGE COMPLETED.—DRAWN BY TONY JOHANNOT.

They supped together at a neighbouring inn. On the morrow, Ernest said, "Where are you going now, my father?" Peter named the town to which Ernest himself was returning.

"I must be there in three days," added the old musician; "for I have reason to believe I am expected there."

"It is my own road," said the young man; "shall we walk together? I may, perhaps, be able to render you a little assistance."

"I willingly accept your kind offer, my friend; but when arrived at the town, I hope to have no further need of assistance."

"How is that?" said Ernest.

"Let us commence our journey, and I will tell you on the road."

They settled with their host, and set out. As they walked together, Peter related to Ernest what he knew as well as the old man himself. The young man was touched with the confiding simplicity of his companion.

"My master," said he, "do you think these students will keep their word?"

"They will keep it, my friend, I do not doubt, or they would not have promised. Besides, they spoke to an old man, and called God to witness their promise."

"I love your confidence, my father; but if you have not been more on your guard against fine words during your life, I do not much wonder that in your old age you are compelled to beg for bread."

"I have indeed been many times deceived, but I must acknowledge that I have more frequently deceived myself. True, it was chiefly in assisting my unfortunate fellow-beings that I lavished away what Heaven bestowed upon me. But even generosity requires to be exercised with prudence, or we deprive ourselves of the means of more extensive usefulness, and conclude by becoming ourselves burdensome to others."

The old man then began to relate the history of his life. The son of a musician, Peter had been successively organist and chapel-master in several places; but the love of change prevented him from remaining long in any of them, and forgetting his first friends, he forgot himself. "Nevertheless," said the old man exultingly, "I owe to that love of change one of the pleasantest recollections of my life.

"I had left my situation, and was on my journey to a neighbouring prince, who had offered me employ. I passed through a village of Saxony, and night coming on, I sought shelter at a little cottage, where, although a kindly welcome was given, I soon saw that the family were in trouble. During supper, the father related to me the cause of it. He was the schoolmaster of the village, and, until now, his

services had given satisfaction. But a church had just been built, and in it they had placed an organ, which was the pride of the parish. From motives of economy, it was determined that the schoolmaster should undertake the duties of organist. Judge of the good man's consternation; he was not a musician, and therefore he and his family were perhaps about to be reduced to poverty. I pitied him, and said, 'You must let me see this organ.' 'Are you a musician?' said he. 'Music is my profession.' 'You are happy indeed.' 'I shall be, if I can render you any assistance. What if I give you lessons, my friend, as a return for the hospitality of this evening?' 'Ah, sir, this evening?—my whole life I shall be indebted to you.' I made him sing, and found that he had a good idea of music, and he was still young 'In six months,' I said, 'you shall be able to discharge the duties of your situation; meanwhile the good people will, I trust, accept of my services.'

"This, my young friend, I faithfully accomplished. True, Peter lost thereby the situation offered him by the prince; but we cannot do everything at once."

"Peter!" cried Ernest, seizing his arm. "It cannot be that you are Peter Schlich?"

"I am, indeed, my son."

"And what you have related took place—?"

"At Schlossheim."

"Just so! In 1806 or 1807?"

"Wait, my friend. Yes, in 1806 and 1807."

"It was, then, my father to whom you rendered this service! It was his family that you saved from indigence!"

"Is it possible, my son? And are you little William Spach?"

"My brother is dead."

"And your sister, the pretty little Gretchen?"

"God has also taken her to himself. My mother is a widow, and I am now her only child."

The old man with tears said: "Then you are little Ernest, and my godson, although you do not bear my name. I feared lest it should bring upon you misfortunes like my own."

The old and young man tenderly embraced each other, and Ernest was just about to reveal his secret; but he promised himself so much pleasure in the surprise, that he would not enjoy it alone.

"My mother shall share my happiness," said he to himself.

As they continued their journey, the old man related to his godson, how from year to year he had seen his resources diminish and his hopes of fortune vanish. "And here I am," he concluded, "at seventy years of age singing in the streets—an artist can descend no lower. One consolation remains to me; that, having no family, I have wronged myself alone."

"And have done much good in the world; my father, wait awhile—all will not be ungrateful."

Delighted with the affectionate interest of the young man, the musician inquired of his affairs, and finding from Ernest's replies that he and his mother were in straitened circumstances, he said to himself: "Yes, wait awhile! if these students keep their promise, I will not enjoy my cottage alone." They now approached the town, and the road passing by the little farm, Ernest conceived the idea of taking Peter in under some pretence.

"I have," said the young man, "some business to conclude with the master of this house."

The old man accompanied him without asking any explanation. He was fatigued and glad of a rest, and it would suffice for his mysterious engagement if he arrived at the town that evening. He, therefore, only asked his godson, if he were likely to be engaged long enough to allow him meanwhile to take a nap on a heap of straw which was lying in a corner. Ernest, who was glad to be at liberty to make the arrangements he desired, assured the old man that there would be ample time for him to repose. Peter then lay down on the straw, a bed to which he was quite accustomed, though he could not always command a heap so fresh and clean.

Upon his entrance into the domain, Ernest had glanced anxiously round; and what was his joy to find that it was still for sale! He found the owner sitting upon the bench as before, looking as if he had not moved from it, while the young man had been compelled to make so many movements to attain his end.

"Your farm is still for sale," said he, after a familiar salutation.

"Yes, my friend; I have had inquirers, it is true, but none of them have concluded, and I am free to give you the preference."

"And the price?"

"The price has changed no more than the house and grounds. You see they have not been neglected."

"Will you leave the furniture and the implements?"

"It was not my intention to do so."

"Well, sir, if you will yield this point, I know a purchaser who will pay you down."

The farmer reflected a few moments.

"A purchaser?" said he.

"Yes, sir; and if you consent, it can all be settled in an hour."

"Agreed, then," said the farmer, taking his hand.

"I will go to the town," said Ernest, "and engage a notary. I wish also that my mother should witness the deed of transfer. If this man should awake during my absence, tell him nothing. Merely say that I shall return in an hour, and requested him to wait for me."

Ernest hurried to embrace his mother, and took her with him to the notary, relating to her his adventures by the way. The notary immediately followed them, and they found Schlich still sleeping when they arrived.

"Do not wake him yet," said Ernest; "we can proceed without him."

The notary had soon drawn up the contract; and when he was about to insert the name of the purchaser, the young man said, "Write Peter Schlich!"

Peter awoke just at the moment when his presence was needed for the acceptance. Rubbing his eyes, and perceiving that it was growing dark, he jumped up. "Ernest!" he cried, "it is getting late; I must go where I am expected.—Ernest, where are you?"

Ernest came out, and taking Schlich by the hand,

"Come in, my father," said he, "we want you here."

"And the meeting?"

"You will have time enough for that. Pray come in, and hear something read in which you are interested.

"Something read?"

"The thing will explain itself."

Ernest seated him in a corner, without introducing him to his mother. The old man did not recognise her. The notary read over the contract.

"What do you say?" exclaimed Peter, when he heard his own name; "Ernest, are you mocking me? How am I to pay for what you have purchased for me?"

"My father; have you not four debtors in the town? They are punctual; they have charged me to pay your account." Saying this, Ernest threw his purse upon the table.

"There," said he, "is the price of the cottage and the orchard. Is *poor Peter* contented?"

"I am indeed!" cried the old man; and it was thyself, my son; it was thyself who made me the promise!"

"And here stands one who commanded me to keep it. My mother!"

"Ah, sir!" said Catherine, "my son did not need to know that you were our benefactor, in order to induce him to keep a promise made to an old man in the name of God. I endeavoured to strengthen him in his good resolution. All the rest is his own work."

"I accept the temporary use of it," replied Schlich, pressing Catherine's hand, "provided you do not leave me here alone. This house is large enough for three, and it is near the town. Ernest can reside here without interruption to his studies. At my death you will become the owners of it. On these conditions the affair is settled."

Ernest would not raise objections nor think of the future;

the present was just now sufficient for his happiness. He had paid a debt doubly sacred. He had wholly redeemed his promise, and the honour of his companions was saved. Alas! they had great need of his generous extenuation. They returned a little time afterwards with empty hands. One had lost all his money by gaming, another in frivolous expenses, and the third had associated with a knavish musician, who had robbed him. Ernest wished to conceal their faults; but they could not consent to receive the thanks of the old man which they did not deserve.

"We have been guilty," said Christopher, "of as much frivolity in the affair as our comrade has shown of prudence and honour. We have no share in this, except that Heaven permitted our fault to be the means of your discovering your godson some days earlier than you would otherwise have done. For his sake forgive us, and even allow us to ask for a small share of your regard."

Poor Peter Schlich pressed the hands of the three young men. They subsequently visited him occasionally, and spent the evening in the enjoyment of music, and partaking of the fruit that the orchard produced. The prince was delighted to hear that his young guest had found in the old musician a friend of his father, and would not allow them to speak of repayment. As for Peter Schlich, he would not have changed situations with his highness. After so many reverses, the old artist at length enjoyed repose; his last days were his best days. At his death, Pré Fleuri passed into the possession of Ernest and his mother.

THE CELEBRATION OF THE FIRST MASS IN AMERICA.

All our readers know that Columbus was a religious man. It was a religious age in which he lived, and he drank deeply of its spirit. When he first visited the court of Spain after his first voyage, the anthem *Te Deum Laudamus*, chanted by the choir of the royal chapel, with the accompaniment of instruments, rose in full body of sacred harmony, bearing up, as it were, the feelings and thoughts of the auditors to heaven; "so that," says the venerable Las Casas, "it seemed as if in that hour they communicated with celestial delights." When Columbus planned his second voyage, his mind was teeming with glorious anticipations for the deliverance of the holy sepulchre. The sanction of the Pope was sought, and when he set forth a second time, the glory of God was as much the object of his enterprise as any glory that might accrue to himself. If his crew consisted of the high-spirited cavalier bound on romantic enterprise—the hardy navigator, ambitious of acquiring laurels in unknown seas—the roving adventurer, seeking novelty and excitement—the mere calculating speculator, eager to profit by the ignorance of savage tribes,—it also consisted of the pale missionary from the cloister, anxious to extend the dominion of the church, or devoutly zealous for the propagation of the faith. The religious portion of the crew was composed of Friar Boyle and twelve monks. Friar Boyle was at the head of the religious fraternity, one of the members of the council, and apostolical vicar of the New World. He certainly, however, seems by no means to have been the proper man for his work. He never agreed with Columbus, and was a sad thorn in the side of that heroic and pious man. Washington Irving says: "It is not easy to ascertain the original cause of this hostility on the part of the holy friar to the admiral, who was never wanting in respect to the clergy. Various altercations had, however, taken place between them. Some say that the friar interfered in respect to the strict measures deemed necessary by the admiral for the security of the colony; others, that he resented the fancied indignity offered to himself and his household, in putting them on the same short allowance with the common people. He appears, however, to have been generally disappointed and disgusted with the sphere of action afforded by the colony, and to have looked back with regret to the Old World. He had none of that enthusiastic zeal and persevering self-devotion which induced so many of the Spanish missionaries to brave all the hardships and privations in the New World, in the hope of converting its pagan inhabitants." Nor was this the only stumbling-block. It was too much the case, that many of the followers of Columbus denied in their lives the truths they professed to believe. Men of violence and plunder and licentiousness, would do more harm in a day than the missionaries of Columbus could counteract in a year.

Still, wherever he went, Columbus had mass performed. It must have been a strange sight to the rude and trembling natives, to witness the grand ceremonial of the church of Rome. What did they know of sin—of an angry God—of an atonement by which man's guilt was wiped away and the wrath of Heaven was appeased? At Havannah a native chapel still exists on the spot where the natives first witnessed this grand and novel sight—where for the first time that name which is above every name, and to which every knee shall bow, was first heard in America. At Isabella, in Hayti, the pillars of the first church still remain. At the present day it is quite overgrown with forest, and in the midst of this forest are still to be seen partly standing the pillars of the church, some remains of the king's storehouses, and part of the residence of Columbus—all built of stone. It seems, after all, there are ruins, and deserted cities, and traces of external civilisation, in the New World as well as in the Old. Columbus was mistaken as to the religion of the native race with whom he came in contact. He thought their conversion would have been an easy matter. It was soon discovered that these islanders had their creed, though of a vague and simple nature. They believed in one Supreme Being, who was immortal, omnipotent, and invisible—to whom they ascribed an origin—who had a father, but no mother. They never addressed their worship directly to him, but employed inferior deities, called Zemes, as messengers and mediators. Each cacique had his tutelar deity of this order, whom he invoked and pretended to consult in all his public undertakings, and who was reverenced by his people, to whom temples were everywhere built. The Indian burials were strange. Chiefs on the bed of death were strangled, that they might not die like other men. Poor people were left in their hamacs, with a provision of bread and water, to expire at leisure, unless the cacique kindly honoured their relatives with permission to use the bowstring. Mystic dances were performed, and numerous rites observed, all tending, as they believed, to smooth the road to heaven. Paradise was said to be a lake-bordered region in the west, where, in broad green valleys, abounding in a certain pleasant fruit, the souls of the dead, concealed all day in rocky caves or hollow trees, came forth at night to revel and regale on the sweet fruits of the valleys. "Indeed," says a popular writer, "the ideas, the manners, and the lives of these simple people were pervaded by the most unsophisticated spirit of harmony. They almost realised, in the unclouded sunshine of their existence, the fable of the happy hunting-grounds; but with the first flourish of the Spanish trumpet and the flash of European steel, the seed of a conquering civilisation was planted, the spell of their long enchantment was broken, and a new era, marked by much of misery and contest, dawned upon the Indian race." Enlightenment and Christianity broke upon the heathen darkness of the New World; the cross was erected, and still the cross is held sacred there.

But who can stay the ever-changing tide? or who can bid man's ever-shifting mind be still? There have been old creeds turned to rags, old temples crumbled into ruins, old gods given to the moles and the bats; but still man, in his best and loftiest moments, is true to his religious yearnings;—still, like the old Indian, he sees in the sun that shines by day, and

in the moon that rules by night, the presence and the power of a Spirit whose favour he does well to gain;—still, from this troubled world o change and toil, he looks forward to the eternal and the true. Each age may have its own creed; but the spirit in which each creed has its birth still remains the same. Every new age, every fresh light thrown on the world within or the world without, may modify the former; the latter must live.

CELEBRATION OF THE FIRST MASS IN AMERICA.

ENGLISH RURAL SCENERY.

"The stranger," says Washington Irving, "who would form a correct opinion of the English character, must not confine his observations to the metropolis. He must go forth into the country; he must sojourn in villages and hamlets; he must visit castles, villas, farm-houses, cottages; he must wander through parks and gardens; along hedges and green lanes; he must loiter about country churches; attend wakes and fairs, and other rural festivals; and cope with the people in all their conditions and all their habits and humours." The English are, without doubt, strongly gifted with the rural feeling, and possess a keen relish for the pleasures and employments of the country. This is not mere romance or poetic illusion, but as true as facts and figures. Has not the merchant a pretty bit of garden-ground a little way out of town? and has not the man who is doomed to pass his life in the din and traffic of the city, something to remind him of the face of nature, though it be but a poor dusty shrub growing in a butter-tub—like that described by Hood—and located on the tiles of a warehouse? And does not a rural feeling—the breath of Arcadia—give a sweet perfume to English literature, continued from the "Flower and the Leaf" of Chaucer down to our own times? Milton is thoroughly English with his "sunshine holiday," and furrowed land, and russet lawns, and hedge-row elms, and upland hamlets, and meadows trim; and Shakspeare, "enamelling with pied flowers his thoughts of gold," presents beautiful pictures of rural scenery and the shifting seasons of the year; while Spenser, with a vigorous pencil, sketches the "Green Leaves" of the "Jolly Summer." Old Allan Ramsay, and the Ayrshire Bard, and Scott, Joanna Baillie, and poor Keats, all describe the pleasures of the country, and draw their happiest images from rural objects; while Thomson in the "Seasons," and Bloomfield in the "Farmer's Boy," present us with complete pictures of rural labours and delights. White and Bewick, Evelyn and Howitt, have written books illustrative, especially, of nature in her simple country attire. Through them we see the thatched farm, and the tall trees spreading their gnarled arms over the rich greensward; notice the climbing plants that mantle and festoon every hedge—the wild hop, the clematis, and the large white convolvulus; the hare-bell of the poets, and the blue-bell of the botanists, arrest the attention; the landscape presents an aspect of warmth, dryness, and maturity; brown pastures and corn-fields white to the harvest, dark lines of intersecting hedge-rows, with here and there the glimpse of a noble river, or a little mill-stream, or fragrant ricks rising in the farm-yard, while the smooth-shaven fields are left in solitary beauty;—all these, and a thousand other objects, are brought before us in the pages of these rural-loving books. Now we have the March winds sweeping over dry and leafless trees; now thick blossoms bursting in clusters on the fragrant hedges, and the trees dight in delicate and lively verdure; now summer comes, glowing summer with its months of heat and sunshine, clear fervid skies, dusty roads, and shrinking streams. And then the harvest, when nature has ripened her best fruits, and the reapers are ready with their shining sickles to gather her bounty to the garner; then comes a tint of ruddiness on the hedge-fruit, a white fog rolls over the valleys, and, as Ossian has it: "Autumn is dark on the mountains; gray mists rest on the hills; dark rolls the river through the narrow plain; the leaves whirl round with the wind and strew the graves of the dead." The end of the autumn has

AN ENGLISH LANDSCAPE.

been beautifully described by Tennyson; and another poet furnishes us with a greeting for old winter:—

"With his ice and snow and rime,
Let bleak winter sternly come;
There is not a sunnier clime,
Than the love-lit winter home."

The engraving which we present is thoroughly characteristic of English rural scenery.

LETTER FROM CONSTANTINOPLE.

——, 1853.

At last I am within the walls of Stamboul. My first view of the place was not promising, because I came up in a fog; but this soon clearing away, I saw a truly magnificent sight from the deck of the steamer — Stamboul on one side, Galata, Tophana, and Pera on the other. The view here is truly striking. The palaces, the mosques, the minarets, the copper-coloured cupolas, the Frank quarter, the splendid mansions of the foreign ministers, the public buildings which stand up in bold relief on the hills in Europe, and in Asia, also at Scutari —form a great panorama of unrivalled beauty.

It is a pity that a bad system of police, a total disregard to all sanitary laws, and much of that old Turkish feeling of hesitation and procrastination which has been universally ascribed to the Turks, should leave Constantinople very much what it was many years ago. The events which are now taking place, and which will end, most likely, in involving the whole civilised world in a war, have certainly roused the Turks in a way which really was not expected They are shaking off the dust of the last half century, and showing that they are not so incapable in military matters as some have fancied. The new-fangled show-troops of European Turkey are, however, less prominently effective than the bold and warlike hordes which have been pouring for some time out of Asia.

But if they are showing activity and progress in arms, they have yet to satisfy us with regard to civil reforms. In the first place, what strikes the traveller forcibly is, the dirty and disagreeable state of the streets, which are ill-paved, unwatered, and without scavengers, save the hungry dogs that prowl about the streets by day and howl in the cemeteries by night. These dogs were a much greater nuisance than they are now. It is not long since the true Mussulman thought it his duty to insult a Christian, and to set the dogs upon him as he passed. But policy is doing what gratitude will ultimately make permanent. A Frank walking through the streets is now not only not molested, but treated with respect and deference; and English ladies go as freely into the Turkish quarter now, unveiled, as they would in London or Paris. This is a concession to the power and influence of Western Europe which it is important to observe, as the whole future destiny of Turkey depends on her becoming friendly and tolerant to its own Christian population.

The motives of a Turk are difficult to understand; but it appears to be the general impression, that all thinking Osmanlis see clearly that the anomalous position of the *rayahs*, or Christians, in European Turkey, is the real cause of most of her difficulties, and a disposition is really shown to put an end to all those disabilities, civil and religious, which have hitherto kept up a war of races and a marked distinction between the rulers and their serfs.

The position of the *rayahs* in European Turkey has been fearfully bad, and yet I doubt if it has been so demoralising and degrading as that of the Russian serf. But the *rayah* sees before him the dawn of a brighter day; the myriad slaves of the Czar have before them a long, hopeless, Arctic night, with Siberia for a resting-place. The rulers of the Turkish empire have had their eyes clearly opened to the fact, that a large and industrious and wealthy portion of their subjects should no longer be treated as a conquered race.

Hitherto no Christian could serve in the army or navy, hold any but a subordinate place in the civil service, give evidence in a court of law, own property to any extent without a foreign protection, or possess or exercise any of the meanest rights of freemen. All this, we are promised, is to be changed, and the formation of a Christian regiment is a very promising and good sign. Complete equality between the believers in any religion must be allowed. This must end in the speedy preponderance of the Christian population in European Turkey; but that is not a thing to be deprecated. The Turks are a little over three, the Christians a little over eleven millions, in Europe. The Turks are about sixteen millions in Asia—as fresh, vigorous, and untamed, as they were two centuries ago; firm believers in the prophet, utterly without that leaven of infidelity and gross materialism which pervades the young men of this city.

It was in Turkish courts of law that the position of the Christian was peculiarly painful. Until within a few weeks there was a law prohibiting the reception of Christian evidence. Under the influence of our excellent ambassador this law has been repealed. This is a very great step in advance it will do much good, especially if measures be taken to remedy the extreme venality of most of the judges, kadis, and others: they are nearly all to be bought, as are the inferior officials, and generally from the same cause, low salaries—salaries barely sufficient for their existence.

A few anecdotes in connexion with Turkish courts of law will be worth preserving, even as a contrast to the new system which we are assured is now about to be efficiently carried out. They are well authenticated. Indeed, I shall tell you nothing in these my jottings down but what I have on good authority.

Not very long ago a *rayah*, a Christian subject of the Porte saved by dint of great industry and perseverance the moderate sum of 10,000 piastres, or about £90, which, however, to a small shopkeeper in Stamboul was a fortune. It is a melancholy fact, that under the old system, the *rayahs* were never safe from being plundered when they were known to have money. For this reason, merchants, dealers, and those who had by any means saved a little money, always contrived to take a short journey in search of a foreign passport, and came back, after three, six, or nine months, with an English, French, Greek, Swiss, or Russian passport; which made them inviolable, because it entitled them to the protection of the embassy of the country whose passport they carried. This thought occurred to the rayah, Gregorio, who had saved 10,000 piastres. His next-door neighbour was a Turk of notoriously dissolute life and manners. By some means or other he learnt that Gregorio had the sum alluded to, and meant to go away, and return a Russian, probably—for the Greeks, to their eternal disgrace, lean far too much to this power—when he would be out of the power of any one to oppress him.

So Abdallah Mustafa went with a friend of his own kind, a worthless profligate, before a judge, who was notoriously an honest, upright, and honourable Turk—a Turkish gentleman in fact, of the old school before 1821. Before this bearded judge, the two friends swore a falsehood. The friend said "On the second hour of the third day before the Ramadan, I saw this Turk, Abdallah Mustafa, lend to Gregorio, a *ghiaour* (infidel), the sum of ten thousand piastres, and I am quite certain that the money has never been repaid. More than that, this *kelb*, this dog, this pork-eating infidel, is about to run away."

And the judge replied: "Be it so. Let the Christian pay. Two Turks have sworn by the Koran that it is—and it is."

And the two friends went away and unblushingly told Gregorio of the decision of the magistrate. Gregorio was well-nigh driven mad—he wept tears of rage and despair, and then ran out and told his story to a wealthy Greek merchant.

"It is very strange," said the merchant. "The Kadi is a good man. But perhaps he has been imposed upon. I will go and see him."

And the Greek merchant went and saw the Turkish judge. The judge listened to him gravely, stroked his beard, and said: "I believe what you say to be true; but the Koran gives me no choice. Two Turks have sworn a thing against

a Christian; they have eaten dirt, they have lied; but the Christian has no remedy—he must pay. A judge can only decide according to evidence. Mashallah! I am very sorry, but it is so."

The Greek merchant was very sad, and almost feared he must raise a subscription for Gregorio, which he thought unfair, seeing the poor man was really the owner of the 10,000 piastres.

"Wallah!" said the judge; "I see you are hurt at the *rayah's* misfortune. Bismillah! what I say I ought not to say—but God's will be done—these two men are the fathers of lies. Go down to Galata, enter a large coffee-house, and there you will see an old man, who—Inshallah!—please God!—will get you over your difficulty. Allah Kerim!—God is great and merciful. Go."

The merchant and Gregorio went down as told to the coffee-shop, on entering which they saw an old man taking his coffee and solemnly smoking his pipe. Though an old scoundrel, and driving an infamous trade, he was a grave and venerable personage, and the Greeks bowed to him politely.

"La Allah Wah Allah Mohammed resoul Allah," * said he, "what wants my lord with his servant?"

He could be polite to a *ghiaour* on occasion. They told their story without hesitation.

"What *backsheesh* will my lord give his servant?"

The Greek merchant gave a piece of gold.

"Allah Kerim! go. Inshallah! your affair is settled."

"But——" began Gregorio.

"You would see how it is to be done. Go, call me two Turkish boatmen."

Gregorio did as he was told; the Greek merchant smiled, and none the less when two boatmen of the Bosphorus entered.

"You see that *ghiaour*," said the old man, pointing to the *rayah*.

The boatmen nodded their heads.

"And you see these piastres," showing them twelve piastres.

The boatmen looked quite lively.

"Well, to-morrow go before the kadi; and recollect, or may you die in the Tedi Khouli, on the second hour of the third day before the Ramadan, this Christian was in a boat with you, out at sea, looking out for a ship."

The boatmen intimated that they perfectly recollected the fact, and went away.

Next day all parties appeared in court. The two Turks on one side swore one thing, the two Turks on the other swore the direct contrary, proving an *alibi* most distinctly.

Then up spoke the judge and said: "As two Turks say one thing, and two Turks say another, we must leave all things to the judgment of God. Allah Kerim! I dismiss the case. As it is, let it remain."

With many such unbiassed judges as these, and a new system, coupled with the destruction of the bastinado, Turkish courts of law would soon improve. But the judges must be better paid, and a better system of surveillance adopted. Not long since a man was tried for the murder of his wife. It was a brutal case, and had not occurred within the sacred precincts of the harem. The case was clear, public indignation was at a great height, the relations of the wife asked for the application of the *lex talionis*—though capital punishments are all but abolished, of which my space will not allow me to say more—and the judge was about to decide against the assassin. Suddenly a letter and a bag were passed up by a *kapoudge-bassi* to the bench. The letter was from a friend of the murderer, and the bag contained five hundred dollars.

The judge gave judgment after consulting the Koran, and said that the law and the prophet declared, that none could ask blood for blood but the nearest relative of the deceased. Now the nearest relative of the deceased was her own child, an infant of seven months, and he *therefore adjourned* the case until the son's wishes could be known.

The influence of western civilisation has already, however, been felt; and I do really believe, when the world is rid of the present quarrel, a new impetus may be given to Turkey, by a reconciliation, and perhaps in the end an amalgamation, of the two races.

Fires are not quite so common as they used to be. The *hamals* and *sahiers*, porters and water-carriers, have been long suspected of being at the bottom of these frightful scenes of destruction to life and property, which have been of daily occurrence in Constantinople. They made immense sums of money by aiding in saving goods and lives at night. The houses being of wood, whole quarters are burnt down in a few hours. But since a threat of a very severe kind has been directed against the *hamals* and *sahiers*, the conflagrations are slightly less in number.

I have made one or two excursions round Constantinople, and visited some spots of extreme beauty. I shall give you some account of my peregrinations in another letter, seeking, however, rather to tell you of manners and customs than of things which, to a great extent, have been described until some of them have become as familiar as household words. A friend of mine recently visited the Sultan's palace, and even entered the harem. It is a meanly furnished place, with chintz curtains and ancient coverlets on divans, a few prints of English and French battle scenes, and nothing of any kind to please the eye or taste but some cool and refreshing fountains. The library of Korans is curious, while the armoury is full of Eastern arms—some very antique. The mosques look better outside than in. The strange building in Leicester-square, so oddly placed amid our houses and bricks, gives a very effective idea of one of these buildings. The principal is St. Sophia, once a Christian church. It is a striking building outside, but I have not yet seen the inside. The most striking building, however, in Constantinople is the Sulemanaya, which can be seen from a great distance. It is a perfect tier of cupolas, rising one above another, and crowned by a single dome of enormous span and elegant proportions.

* "There is but one God, and Mohammed is his prophet."

TURKISH PIPES.

SMOKING is one of the greatest delights of a Mussulman. It seems with him a second nature, and that it would be as easy for him to exist without food as without tobacco. It has been said, that the custom of smoking in Turkey and Persia dates far earlier than the period at which tobacco was discovered in America, and hence the previous existence of the plant in those countries has been inferred. But, although the habit now prevails universally in the East, the tobacco-plant is never once hinted at in any of the authorities which treat of ancient Oriental productions; and that a custom so peculiar as smoking should have been totally omitted in the graphic descriptions which old writers give, seems scarcely possible, if it were then known. Yet the Koran itself, a book which legislates on all points, small and great, is altogether silent on the subject. Long before the discovery of America, Europeans were acquainted with the peculiarities of the East. Thither went Lion-heart and his crusaders, even in the dark ages, and the manners and customs of the Turks became thoroughly known: later than this, the wealthy merchants of Venice and other cities on the Mediterranean carried on a traffic in the Levant, of which all sorts of Eastern commodities were the subjects. Yet no such thing as tobacco is ever alluded to in any way.

From this it appears that, although the custom of smoking prevails so extensively in the East now, before the discovery of America it was altogether unknown. When the Spaniards

landed in the New World, they found the people of Yucatan, in the Gulf of Mexico, holding the tobacco-plant in high esteem. The Indians regarded it not only as a luxury, but as a universal remedy for disease; they carried it with them on hunting excursions, and used it as food if their provisions failed, and venerated it so highly that they presented it in their religious services as the most acceptable offering to the gods. Cortez carefully inquired into all the uses of the newly-discovered plant, and tobacco was transmitted to Spain, with an accurate account of the virtues, real and imaginary, which it was said to possess; and soon after this it began to make its way throughout the East, a ready market being found in Arabia, Hindostan, and China.

The Persian or Turkish pipe is generally composed of a box or vase, about half-filled with water; a perpendicular tube, or pipe, which is introduced into the vase and immersed in the water; a small furnace, generally of metal, which surmounts the perpendicular pipe; a cover, which serves as a species of ventilator; and lastly, a second perpendicular pipe and flexible tubing, which communicates with the tobacco and serves the purpose of an ordinary pipe.

When the vase which receives the water is in the form of a bell, and the two tubes are adapted so as to be arranged side by side in the bell, the pipe is called Houkka or Hokka, an Arabian word which signifies box. This form and name are peculiar to India. The Houkka represented in our engraving (p. 405) is one which was recently purchased in Constantinople by a distinguished orientalist. The water vase is remarkable for the elegance of its form and the delicacy of its workmanship; the brilliant red of the interior of the vase, and the exquisite finish imparted to the silver network by which it is covered, add considerably to the beauty of the effect; the lid of the furnace and the two pipes are of chased silver; the flexible tube—called *marpitch*, or winding serpent—is of cherry-coloured silk and gold, and terminated by an amber mouthpiece. The costly and ornamental character and the exquisite execution of this magnificent pipe render it peculiarly interesting even as a specimen of art. The reticular work, so light and elegant, is evidently Indian.

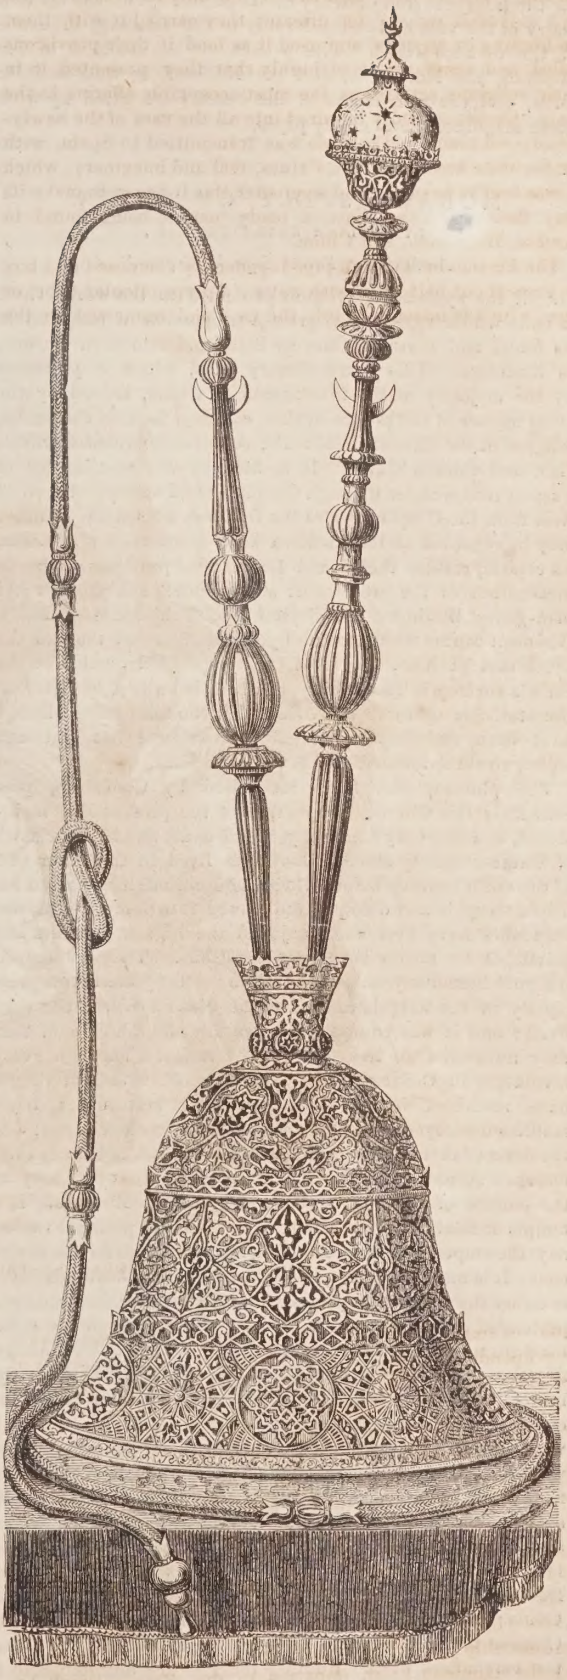
When the vase which receives the water is of an oval or egg-form, and terminates in a point, and the tubes are differently arranged as to their position from those which form the Houkka, the pipe is called Narguileh, from the word *narguil* or *nardjil*, which signifies cocoa-nut. At Constantinople the vase is a glass bottle; at Bagdad the cocoa-nut is in general use. In the Narguilehs of the opulent, the cocoa-nut or the bottle is replaced by an oval vase of silver; and as the pointed shape of the vase will not allow of its standing on a plane surface, it rests on an artistically-decorated tripod, elegantly chased in silver, and which forms a necessary adjunct to the pipe. A simple stool, with a hole bored in the seat, answers the same purpose in Bagdad.

A WOMAN OF CAIRO SMOKING.—FROM A DRAWING BY KARL GIRARDET.

The Narguileh, of which we present an engraving (p. 405), is of chased silver, richly and tastefully ornamented; the medallions in enamel represent the busts of men and women, and surround the furnace and the water vase; the other parts are covered with Persian ornaments and gilt figures; the bottom is of a beautiful blue and red enamel, upon which are represented garlands and little bouquets of flowers in bright colours; the pipes are of ebony tastefully carved. The lid is ornamented with silver chains, which serve to attach it to the furnace. A small but elegant tripod accompanies the Narguileh.

The third variety of the water-bowl pipe is the *Kalioun*; or, as it is commonly pronounced by the Arabians, *Ghalian*, which signifies bubbling, and which is given to the pipe because of the bubbling which the admission of air through the tube

A NARGUILEH.



A HOUKKA.

causes in the water. The *Kalioun* is almost universally used in Persia. The tobacco which is used in the East is remarkable for the fragrance and delicacy of its perfume, and the scented water in the vase adds considerably to the soothing influence of the tobacco itself. The women are accustomed to the Houkka, the Narguileh, and the Kalioun, as well as their lords, and the apartments of the harems are fitted up with these magnificent and costly pipes.

MORAL ASPECT OF CHINA.

BY WILLIAM KNIGHTON, M.A.,

Author of "Forest Life in Ceylon."

Of all the systems of religion professed in the world, there is none which numbers so great a proportion of mankind in its folds, and there is none so little understood in Europe, as Budhism. This extraordinary faith, which is professed by the majority of the inhabitants of China, indeed by the great masses of the people in that country, is also the ruling religion in the Eastern Peninsula, comprising Burmah, Siam, Lao, and Cochin China. It is held by the vast hordes of Tartars that wander through the plains and valleys of central Asia from the Caspian Sea to the frontiers of China. Thibet may be regarded as its northern head-quarters, for in Lassa, its capital, resides the Grand Lama, who professes to be an incarnation of the great saint and founder, the prophet and man-god of Budhism. In Ceylon, too, in the south of India, Budhism counts its adherents by the million; so that all the south-east of Asia, the most thickly-peopled portion of the earth's surface, is Budhistic. So little is known, however, of the statistics of these countries, that the followers of Budha have been variously estimated at from one hundred and eighty to three hundred millions of mankind.

The philosophical faith inculcated by Confucius, pre-eminently the Chinese prophet, is at the present day maintained, and that only nominally, by the court and higher classes of Chinese society alone. Confucius lived in the latter end of the sixth century before Christ, and although he passed his life in struggle and obloquy, and ended it in obscurity, his descendants have ever since enjoyed the highest honours and privileges for nearly seventy generations. They are indeed the only hereditary nobility of China. They are found principally in the neighbourhood of the district where the sage lived; and it was computed, a century and a half ago, that they numbered no less than 11,000 males. Through every revolution in Chinese history, their honours and privileges have remained intact. Thrones have been upset, royal families destroyed, and new ones elevated in their place; but the descendants of the great teacher remained as before, their honours secure, their dignity uninvaded. In every city of the empire of the first, second, and third ranks, there is a temple dedicated to Confucius. The civil and political rulers, nay, the emperor himself, are all equally bound to do him reverence. It is mere ceremony, however; there is no heart whatever in either the admiration professed for the man, or the obedience pretended to be given to his precepts, for his morality was far too pure to suit the degenerate taste of modern China. Altars, it is true, are erected in high families to Confucius, in the hall of ancestors; sweet-smelling gums are burnt in the chamber, with frankincense and tapers of sandal-wood; fruit, wine, and flowers, are placed upon the altars, and appropriate verses chanted. But the whole service is merely one of form; and whilst outward adherence is thus given to the system inculcated by Confucius, Budhism alone maintains any hold upon the masses of the people, and the hold which it maintains is far from being a beneficial one. Introduced from India, it has maintained its sacred language, the Pali, in China; Chinese symbols are tortured to express its sounds; Chinese tongues refuse to utter its words distinctly; so that the ceremonies of the Budhist temples are unintelligible to the people not less than to the priests, and the whole system of religion has long degenerated into an unmeaning mummery, retaining little hold upon the minds of the people, whilst outwardly its temples are grand, its ceremonies imposing, its priests richly dressed, and its monasteries well appointed and full.

Gotama Budha, also called Sakya Mouny, was the founder of the faith. He lived either a thousand or six hundred years before our era, and first preached his doctrines in northern India. Being the son of a king, he easily obtained protection and converts in the first instance, setting himself up, not so much as the preacher of a new faith, as the reformer of the old and almost worn-out Brahmanism which still lingers in India That such a man as Gotama actually did live, no one who has examined the faith has for a moment doubted; and, as the history of his life was not written till centuries after his death, we need not wonder at the marvels related of him, or the extraordinary miracles which he is said to have wrought.

He left behind him both priests and priestesses, whose office it was to preach his doctrines and to attend to the images and offerings in the temple. In most Budhistic countries, the order of priestesses has long been extinct; but it still lingers in Burmah and China, the nuns, if such they can be called, being, however, esteemed as little better than beggars. Nothing can exceed the ignorance of these Chinese pretenders to sanctity. The abstraction of the mind from earthly things, and the fixing of it on spiritual things, is regarded by Budhism as one of the most beneficial mental exercises; and some of their priests seem to have so far succeeded in this matter, that it is impossible to tell if they have any mind at all. Their look savours of vacancy and want of thought; they stare wildly at all around them; earthly things have indeed ceased to interest them in many cases; but too often, it is to be feared, it is the look of idiotcy that thus roams unmeaningly from place to place, from countenance to countenance, from object to object. The mind, thoroughly unhinged, but too often detaches itself from earthly things altogether, and is no more to be lured back to its old haunts.

With such religious teachers, with a system prevalent of which they understand nothing but its corruptions, and love nothing but its absurdities, we cannot wonder that the moral condition of the Chinese, notwithstanding their advance in civilisation, notwithstanding their quick-witted skill and progress in many arts, is most deplorable. "Much reliance," says Dr. Gutzlaff, the eminent Chinese missionary, "was placed at the commencement of the war upon the idols. None, however, appearing to assist the Chinese army, and their shrines having been desecrated without the gods taking vengeance for their wounded dignity, the popular belief in Budhism is fast giving way to scepticism." Indeed, it is notorious that in many households the images were thrown down and discarded; and even in Ningpo, the head-quarters of Chinese Budhism, superstition is on the wane—has been long on the wane. Everywhere throughout the vast empire the people seem waiting for something better; they have almost entirely shaken off the trammels of their old faith, and as yet see no light in the mists a-head, or rather only the faintest dawn of light, still very far from their own abodes, or from their distinct comprehension."

The pernicious habit of opium-smoking, so prevalent amongst the Chinese, tends to destroy what little religious feeling is left amongst them. In Hong-Kong, for instance, an insignificant island, with a population hardly amounting to 20,000 in all, a man pays the British government 1,500 dollars a month for farming the duties on opium alone; and yet, of these 20,000 inhabiting the island, a considerable proportion, probably one-sixth, is European, and the Europeans are but beginning to adopt the odious practice now—they have not yet attained the perfection in self-ruin to which the unfortunate Chinese have advanced. Even into England itself the practice has been largely imported by those who have returned from the East, and more than would be supposed possible of the wasted frames, sunken cheeks, and wild staring eyes, that one meets in the Strand or Cheapside, may be attributed to this unwholesome enjoyment.

In Hong-Kong, the largest consumers of the drug are the shopkeepers, sailors, quarrymen, and dissolute adventurers,

driven for their evil practices from the continent—the very plague-spots of the island. In most districts of China, however, mandarins and soldiers are the greatest consumers of opium: mandarins, because it is an expensive amusement, and bespeaks courage and wealth to indulge in it—the soldiers, because it is regarded peculiarly as a military and chivalric vice. The sailors, too, inhale its fumes largely; with them it is one of the most piquant of their pleasures; their perilous life leads them to peculiar and selfish indulgences, and the vigour with which they enter upon their career soon gives way, under the baneful influence of opium, to languor, senility, and exhaustion. The agricultural labourers are by far the most numerous classes in China, and amongst them there is little opium-smoking, if any. It is, fortunately, too expensive a luxury for *them* to indulge in.

With respect to the use of opium generally, a recent writer on China asserts, that the larger the consumption of the drug, the more frequent is crime of every description—the more extensive the trade in it, the greater the moral misery which spreads over the country. As a general rule, those that give themselves over without restraint to this moral mania, become wasted and attenuated in person—they walk about, looking like gaunt skeletons—are often covered with running sores, and disfigured by all kinds of cutaneous eruptions. Not that all these result from the opium alone, but its excessive use is invariably accompanied by excessive gambling, intermingling with the worst people in the worst places, and hence the evils hinted at.

The difference between the coast and agricultural population of China is strikingly exemplified by the contrast between the inhabitants of Hong-Kong and those of Chusan. Hong-Kong was originally a very poor place, occupied by a small and depraved native community, engaged principally in quarrying, fishing, piracy, and bartering. The arrival of the English on the island, and their permanent settlement there, naturally attracted together crowds of adventurers, of gamblers, and of the bad of both sexes. "There is, perhaps, no place in the world," said a Hong-Kong magistrate, "that presents a more fearful criminal calendar." Nor would it be easy to name a vice which does not degrade some portion or other of the population of the island. Chusan, on the other hand, has entirely an agricultural population all attached to the soil. The families possess a sufficiency, and, having so much to do, are all peaceably disposed, quiet, and regular. The entire population, in fact, consists of quiet and orderly people, insomuch, that adventurers of doubtful character, and vagabonds, have little chance of success in their schemes, because they are everywhere shunned and watched. An instance of this fact occurred during the British occupation of the island. Some pirates and desperadoes were hired by the Chinese government to kidnap a few natives who had been unremitting in their services to the British. This band of ruffians crossed over to Chusan, settled on the coasts, and pretended to be engaged in commerce. The population looked upon them with suspicion, and a popular meeting called upon the authorities to get rid of them. The authorities would have nothing to do with the matter. The populace stormed and threatened the intruders, and they, although they affected to laugh at the threats, at length decamped. A few months afterwards, however, they re-appeared, and seized one of their victims privately and secretly. The whisper was spread abroad that the pirates were again at work. On a sudden the populace rose like one man, the ruffians were all seized and thrust into a boat—eighteen or twenty of them—with stones round their necks, and when they had pushed out into the sea, were all thrown overboard. Not one of them, it is believed, escaped; and the police magistrate, who relates the occurrence, declares, that so secretly were the measures of the populace taken, that he knew nothing of it until it was all over, nor could he ever discover who were the perpetrators. He was fully aware, however, of the worthless character of the people executed. This summary Lynching of eighteen or twenty people beats brother Jonathan's performances in that line hollow.

As a general rule it may be stated, that the inhabitants of the northern provinces of China—the provinces surrounding the capital—are better educated, and more energetic, than those residing further to the south. In the history of the rebellion which still threatens to overthrow the Chinese monarchy, and to found a new, liberal, and reformed kingdom in the place of the old, illiberal, and prejudiced monarchy, this fact has been strangely exemplified. In the southern provinces, the progress of the rebels or of the patriots—whichever we may choose to call them—has been extremely rapid. They overran province after province, each province of the size of a moderate European kingdom, with little difficulty and with great rapidity. In the north, however, their progress has been much slower. They have advanced painfully and laboriously, step by step, town after town causing a stoppage for a week or a month, as the case might be; until now that they have got within two hundred miles of the capital, we hear of few new successes, of no rapid conquests. The Mantchoo dynasty, which still nominally rules the destinies of China, relies most upon the troops of the north, and upon its Tartar auxiliaries, who have been pouring into China Proper for months, but still without producing any marked result upon the contest.

For the present, however, we shall confine ourselves to the moral aspect of the country; and truly this moral aspect is as strange a spectacle as the eastern or the western world can afford. We have here two or three hundred millions of mankind shaking off old faiths that they have held for centuries, as one would put off the thin garments of summer on the approach of winter. Budhism is a mass of unmeaning mummery to them, its scriptures unintelligible, its moral dogmas not understood, and, if understood, little regarded. Their forefathers have believed in Budhism; but to them it is an unmeaning faith, a sound without an idea, a symbol without a name. It has already lost its hold upon their hearts, and they are but waiting, doubtless, to cast aside its nominal, as they have already lost its real, influence. The philosophy of Confucius has for centuries been a sound signifying nothing to the masses of the people; so that they may literally be said to be a people waiting for a religion. Confucianism and Budhism have been tried, and have been found wanting. They have been proved to be quite inadequate to keep a living faith alive in the hearts of millions thirsting for some kind of intellectual and spiritual food. They have had their day, and that day has gone. It remains to be seen whether Christianity will not take their place, and extend its humanising influences over the most thickly populated region of the earth.

Nor is it in the matter of religion alone that the social state of the Chinese portends speedy disruption. Justice exists theoretically in China as elsewhere. The noblest of moral maxims are common to the jurisprudence of Confucius and of Gotama, but the practice and execution of justice is guided solely by self-interest, and corruption is so general that it scarcely excites an exclamation when brought to the light of day. The highest degree of skill in the magistrate and the judge is, how to circumvent—the sole object of the legal officer, how to realise the most money. The prisoner once arrested is at the sole mercy of the mandarin, who listens indeed to whatever may be brought forward in favour of the accused, but whose sentence is unshackled by any guide but his own will, and who clothes that decision in legal language as it may suit his purpose; nor is it difficult to cite such chapter and verse of the code as may appear to support his decision, however much at variance its spirit and the context. Appeals to a higher court are perfectly legal; and even the meanest individual may carry his case before the Supreme Court of Requests at Pekin; but every step of the process involves enormous outlay—an outlay altogether beyond the resources of any but the very rich, and it will probably succeed at an earlier stage by means of bribery. It is against the decisions of the just but obscure magistrates that the rich man's wealth carries the day; the wronged poor man is without redress. Those once thrown into prison may be kept there for any length of time that suits the inclination or

the interest of the magistrate; and many thus perish in gaol whose innocence is a matter of public notoriety, but whose incarceration is an object of desire to some rich opponent.

On the whole it may be safely predicted that the moral and social state of China is such at present that it must sooner or later be upset. Revolution impends from moral as well as from physical and political causes; and we may safely conclude that a people without religion, morals, or justice—a great and a comparatively refined people—must soon shake off the shackles of antiquity and enter upon a new course; leading whither, who can tell? leading to good, we all must hope.

LADIES' DEPARTMENT.

THE TULIP WREATH FLOWER-VASE MAT.

MATERIALS.—12 shades of amber, 7 shades of lilac, 4 shades of green. 4 Skeins of each colour. 5 Steel Needles, No. 14. Cardboard foundation, covered with white or amber cambric, 8 inches in diameter.

FOR THE MAT.—Knit 4 rounds of each shade of amber, beginning with the lightest. Cast on 2 stitches on each of 4 needles; bring the wool forward, knit half the stitches on the first needle; t. f. and k.* the other half; repeat the same on each of the other 3 needles; k. the next round plain; repeat these two rounds until there are 48 stitches on each needle; then cast off, and sew this on the covered cardboard foundation.

FOR THE TULIPS.—5 tulips to be knitted in 7 shades of amber, and 5 in 7 shades of lilac; 4 rounds to be knitted of each shade; 4 needles. Cast on 2 stitches on each of 3 needles; t. f. at the commencement of each needle; k. 1 plain round; pearl a round, increasing at commencement of each needle. Repeat these two rounds till there are 22 stitches on each of the three needles; then first k. 3, k. 2 +, k. 1, k. 2 +, k. 3; turn the work back, and pearl the stitches.

3rd. K. 2, k. 2 +, k. 1, k. 2 +, k. 2.

4th. Turn back and pearl.

5th. K. 2, k. 2 +, k. 1, k. 2 +, k. 2.

6th. Turn back and pearl.

7th. K. 1, k. 3 +, k. 1. 8th. Pearl.

9th. K. 3 +. 20 tulips will be required.

THE LEAVES (10 of which will be necessary).—4 shades of green, 12 rows of each; 2 needles. Cast on 3 stitches; k. plain, till before the centre stitch; t. f. and k. the centre stitch; t. f. k. the remainder plain; p. the next row; repeat these 2 rows, till there are 12 open stitches up the vein of the leaf; then k. 1, k. 2 +, k. plain, till 2 from the centre stitch; then k. 2 +, t. f. k. 1, t. f. k. 2 +, k. plain, till 3 from the end; then k. 2 +, k. 1; p. the next row; repeat till there are 8 more open stitches, that is, 20 from the beginning; then k. 2 + at the beginning and end of every other row, till the last ends in a point. Now sew the leaves round the mat by the part where the stem should be; then sew the tulips on as in engraving, sewing the leaf about 6 rows from the point on the stem of the tulip.

* K. means knit; k. 2 + knit two together; p. pearl; t. f. thread forward,

CARDINAL WOLSEY.

THE county of Suffolk has but few great men to boast of. But it may rejoice in the name of Wolsey, who was born at Ipswich in the month of March, 1471. Common report makes his father a butcher; of this we have no certain proof. The worthy and painful Mr. Groves took three journeys to Ipswich, for the purpose of acquiring information relative to the Wolsey family, but with little success. All he could gather was, that Wolsey's father's name was Robert—no very valuable addition to historical lore. Cavendish says Wolsey was "an honest poor man's son." We are inclined, however, to the belief that the common opinion was correct, and that Wolsey's father was a butcher. Actually, at this very day, there is a butcher in the flourishing town of Ipswich of the same name. A local tradition yet prevalent in his native county also strengthens this report. On the east coast of Suffolk, not far from Southwold, may be yet seen Wolsey's bridge, as it is called in memory of the cardinal. The tale is, that when a boy, driving some cattle, he nearly lost his life there, in consequence of which, when he became great, he ordered the bridge to be built. We are inclined to think that the bridge might have been built by the father, and that, by a process of blundering, common to the agricultural mind, and with which the student of history is well acquainted, what was done by the father was attributed to his more eminent son. It is highly improbable that Wolsey spent any of his time at his father's trade. At the age of fifteen we find him a student at Oxford, and already in possession of his Bachelor of Arts' degree; and before that time he certainly would not have been selected to drive cattle a distance of thirty or forty miles. A little while after, the "boy bachelor," as he was termed, became Fellow of Magdalen College (the funds of which college he appears to have misappropriated for the purpose of building its tower), and tutor to the three sons of the Marquis of Dorset. From his father he obtained his first preferment, the rectory of Lymington, in Somersetshire. There a neighbouring justice subjected him to the disgraceful punishment of confinement in the stocks, in consequence of a riot at a fair, in which our young divine took a somewhat unclerical part. Years after, when Wolsey became Lord Chancellor, Sir Amias Paulet, the justice referred to, found that Wolsey had neither forgotten nor forgiven the act. This affair we can easily imagine made Lymington a very undesirable residence for

HENRY VIII. DISMISSING CARDINAL WOLSEY.

Wolsey. Accordingly, he left it, and became one of the domestic chaplains of Archbishop Dean. On the death of that prelate he went to Calais, where Sir Richard Nanfan, the treasurer, was so struck with his talents for business, as to recommend him to the patronage of the king. The recommendation was not given in vain. Wolsey became one of the chaplains of the court. Soon after, the living of Redgrave, in the diocese of Norwich, was given him, and he obtained the friendship of Fox, Bishop of Winchester, at that time Privy Seal, and of Sir Thomas Lovell, then Chancellor of the Exchequer. The career of our hero seems to have been prosperous from the very commencement. Before some men rise they are brought down almost to the depths of despair. They have to struggle with everything that can break the heart. The great Sam Johnson walked the streets of London with an empty stomach and a yet emptier purse. So have done many of our illustrious great. Hitherto Wolsey had had no opportunity of evincing to the king his capacity for public business. An opportunity now offered. A treaty of marriage was pending between Margaret, the dowager queen of Savoy, and Henry VII. It was necessary to send some one to her father, Maximilian, the emperor. Fox and Lovell recommended Wolsey, who accordingly went. Wolsey made such haste as to return before the king thought he had commenced his journey, and reported the business of his mission with so much clearness and propriety, that he received universal praise; and when the deanery of Lincoln became vacant, it was spontaneously given to Wolsey by the king.

On the 22nd of April, 1509, died Henry VII., and his only surviving son, Henry VIII., ascended the throne. The favour shown Wolsey by the father was continued by the son. In the war with France, which was shortly after undertaken by Henry at the instigation of the restless Julius II., Wolsey accompanied his royal master in the humble but useful office of commissariat; and when Tournay yielded to the English arms, Wolsey was made its bishop. In the forty-fifth year of his age, Wolsey was advanced to the dignity of cardinal, and was installed in Westminster Abbey with more than regal pomp. About the same time the great seal was given him for life, with the dignity of chancellor of the realm. His power now became immense; in fact, he was the real monarch. Henry's will was but a reflection of his own. There were times, however, when Henry differed from the cardinal, as the reader of the first volume of "The State Papers" will soon perceive. However, when they did differ, Henry was generally in the wrong; so that we must not blame him if, with a few exceptions, he gave himself up to the pleasures of the court and the chase, and left Wolsey to direct the affairs of the state. In that dark barbarous time, men only reverenced rank and power as it was robed in splendour. To the taste of the age, in this respect, Wolsey scrupulously conformed. His household establishment was conducted on the most princely scale; according to Cavendish, it consisted of a hundred and eighty persons. No wonder that Salisbury-square, a large piece of ground on the south side of Fleet-street, takes up but a part of the ground on which at one time stood his mansion—which formerly belonged to Empson, but was given to Wolsey by the master he had served so well. Subsequently Wolsey appears to have lived in York-place, near Whitehall—a palace belonging to the see of York, *borrowed* by Henry when Anne Boleyn lived at Suffolk House, next door, and which, owing to a defect in the royal memory, has been ever since retained by the crown. Wolsey's revenues at this time must have been equal to those of his master. They were derived from the fines in the legantine court, the archbishopric of York, the bishopric of Winchester and the abbey of St. Albans, with several other English bishoprics, which were held by foreigners, but assigned to him at low rents for granting them the privilege of living abroad; together with pensions from the Spanish emperor and the French king, the emoluments of the chancellorship, the revenues of the bishoprics of Badajoz and Placenzia in Spain, with rich occasional presents from all the allies of the king, and the wealth and domains of forty dissolved monasteries. His house exhibited the finest productions of art; the walls of his chambers were hung with cloth of gold and tapestry still more precious. The sons of the nobility attended him as pages, and, as Mr. Galt says, "the daily service of the household corresponded to the opulence and ostentation of the master." Abroad he was yet more pompous and magnificent. His progress was a royal one. His daily visits to Westminster Hall, or his Sunday ones to Greenwich, where his royal master then resided, were conducted with a pomp and splendour never equalled before or since.

When Leo the Tenth died, Wolsey aspired to the tiara, but the French and Spanish cardinals joined, and Adrian, the tutor of Charles, was elected to the vacant dignity. Charles united with Henry a second time, and war was again to be declared with France; but how was the money for the war to be obtained? The feudal system was dying out, and it was to the credit of Wolsey that he introduced the financial system which has lasted in England to the present day. He met the clergy, and then the representatives of the people, and prevailed on them to pass an income tax. War with France was accordingly commenced. The campaign, however, failed of any practical result. Charles V. was fighting with more success. Henry rejoiced in his victories till he fancied the balance of power was destroyed by the battle of Pavia, when he, with a chivalry worthy a better cause, went over and sided once more with the French; but no advantage resulted from this change, and the people, heavily taxed, fearful of losing what trade they had by a war with Charles, disliking the alliance with France, began to murmur against the cardinal. Many of the nobility also, whom he had eclipsed, looked at him with unloving eyes. The clergy owed him no good will, for they felt that he had hurt them in two ways: he had endeavoured to make them bear their share of the national burdens, from which they had hitherto been exempted; and he had endeavoured to curb their gross licentiousness of conduct. Wolsey leant upon a bruised reed. His apparent power and splendour were maintained only by the single will of the king, and that king more headstrong and wayward than any man who had hitherto sat upon the English throne; that king, one whose "royal nature," as Wolsey himself said, would lead him to endanger the half of his kingdom rather than want any part of his pleasure; that king, one before whom the proud cardinal had so humbled himself, as often to kneel for three hours together, that he might dissuade him from his will, but in vain. Let but that fickle and imperious will conceive that the cardinal stood between it and the gratification of its appetites; let it but shift to some other subject; let it be but cooled down by indifference and neglect, and Wolsey's fall was inevitable and sure. Already the signs of a coming storm had loomed in the distance and blackened the horizon. Between Wolsey and his royal master more than one misunderstanding had occurred; but Wolsey, blinded by success, little understood how to avert the impending peril. The editors of "The State Papers" conjecture that the conduct of Wolsey in the election of an abbess for the monastery of Wilton occasioned a coolness on the part of Henry which was never removed; and yet within a very short time after, we find Wolsey petitioning the king for a valuable preferment for himself and his natural son. It is true that on his last embassy he seems to have foreseen the coming change; but the wonder is not that he saw it then, but that he had not seen it before. He had seen Empson and Dudley—both of whom he had known as the grasping servants of a grasping king—given up to popular vengeance. He had seen Surrey distanced by himself. He might have seen that sooner or later his hour would come. His own knowledge of human nature might have told him that the man who could be false to the wife of his bosom could also be false to the minister of his choice.

And this time speedily arrived. It was given to Wolsey to feel what others had learnt before him, the proverbial ingratitude of men who sat upon thrones. That gay and giddy Anne, for whose sake he discarded the pope's authority, and who basked a few short years in the sunshine of royal favour, till she also cloyed and was thrown away, bore the cardinal no

good will, as he would have kept her from the dangerous eminence at which she aimed. To preserve herself, she felt that the power of the cardinal must be destroyed. Hence it was, that Wolsey was banished from the royal presence, and that Henry was prevailed upon never more to see the man who had served him faithfully — who had pandered to his pleasures—who had promoted his interests for nearly twenty years. Wolsey did not long survive the blow. Late one autumn evening, a weary cavalcade stopped at the door of Leicester Abbey. "Father," said a broken-hearted, sunken man, "I am come to lay my bones among you." When the morrow's sun sank down the cardinal was no more.

Yet Wolsey deserved the honours he had won. Compared with his contemporaries he appears to advantage. He acted no assassin's part, as did Gardiner, Bishop of Winchester. He plotted no treason, as did Buckingham. Oxford and the College of Physicians yet remain to show how much he would have done for the people over whom he ruled. Never was man condemned by an English parliament on lighter grounds. What he had done, he did under the cognisance of the king. His great blunder was, that he did not see what his knowledge of Henry's character ought to have led him to perceive, that to obtain Anne, Henry was prepared to violate every duty, and to burst through every moral and prudential restraint. Even here he blundered, in common with Campeggio and Clement VII., and to that blunder we owe the Reformation. Undoubtedly Wolsey was fashioned to much honour from his cradle. He had the rare skill, not only to attract men's admiration, but to retain their affections. His personal demeanour was that of a prince. The heir of a hundred kings could not have conducted himself with a haughtier mien and a more regal pomp.

Wolsey's moral character, tried by the standard of the present day, deserves the severest condemnation. Selfish, arrogant, voluptuous, in the day of his pride, he was craven-hearted in the dark hour of his disgrace. Tried by the standard of his own times, he was neither a saint nor a fiend; and he was better than most of his own class. Most of the courtiers of Henry had his vices—none his redeeming merits. It is easy for us to condemn him, but it is evidently unfair. We must not judge men of the past by the light of the present. If they walked not according to the principles of their day, let them be reproached; but not otherwise. The time does in some degree mould the man; over most it tyrannises with an iron hand. There have been better poets than Chaucer—better printers than Caxton—better statesmen than Wolsey; but we still quote their names with respect, because in their day they were each the first of their class. To Wolsey's credit it must be remembered, that those who knew him best clung to him to the last—that when he was weighed down by misfortune and disgrace, Cromwell eloquently pleaded his cause—and that to Cavendish we are indebted for the most faithful picture of his life. Wolsey was Henry's better angel, and, left to himself, Henry became that odious monster—that blot and stain upon the annals of the old country he has ever since remained. It was not till the cardinal's death that the English people really learnt the character of their imperious and besotted king. Wolsey

> "Was a scholar, and a ripe and good one,
> Exceeding wise, fair spoken, and persuading;
> Lofty and sour to them that loved him not;
> But to those men that sought him, sweet as summer.
> And though he was unsatisfied in getting
> (Which was a sin), yet in bestowing
> The most princely. Ever witness for him
> Ipswich and Oxford. One of which fell with him,
> The other, though unfinished, yet so famous,
> So excellent in art, and still so rising,
> That Christendom shall ever speak his virtue.
> His overthrow heap'd happiness upon him;
> For then, and not till then, he felt himself,
> And found the blessedness of being little;
> And to add greater honour to his age
> Than man could give him; he died fearing God!"

Thus writes one, whose "Henry VIII." is still worthy of study, as the best history of that time.

THE CONSCRIPT.

Ivon Marker belonged to that department of France where most of all repugnance is felt to entering the army—to Brittany; and Ivon Marker was coming back from the capital of his canton with a light heart, for Ivon had drawn a good number. Ivon Marker was not then to join a regiment. This had been spared him. The father of Ivon was weak and bent by age, his brother Ioan was not old enough to work, and his sister Bellah had Jannik to nurse. Providence, the pious young man believed, had willed it so that a mother should not be left alone to support a family and work on a farm. His two robust arms still remained to work for her.

These were the ideas of the *gars*—as all youths are called in Brittany—as he followed the path along the cultivated ground. And yet the good luck which had saved him from the military lottery did not wholly gratify him; the joy of the hour did not eradicate the cares of the morrow.

Passing nigh his father's cornfield, Ivon stopped and looked at the poor, sterile land, with here and there a blade of corn, and which, from want of sufficient labour, was invaded by the poppy, the weed, and the wild flower. A little further on, when he reached the little meadow which supplied them with hay, he was struck by the invasion of the reeds; further on still, he remarked the apple-trees in the orchard loaded with dead wood, with white moss and mistletoe. Everywhere poverty and sickness had brought on negligence, and negligence sterility. And yet the expenses of the family increased. The miller was asking for his debt, the ploughshare was not paid for, and the harness of the old horse was falling to pieces. It was of no avail that the mother worked half the night, renewing it at dawn, that Ivon ploughed so resolutely, and sank exhausted late at night over the plough: misfortune had moved more rapidly than their courage.

His joy was, then, far from being unmixed; and away he went across the fields, following in the track of the cattle.

Suddenly, as he came round a cluster of hazel-trees, he heard some one weeping and sighing, and also the voices of those who offered consolation. Approaching nearer, he recognised his neighbour Maharitte, surrounded by her relatives, and a little further on, Perr Abgrall, the miller's son, leaning sadly on his stick. This young man had, to the great despair of his affianced wife, drawn an unfortunate number. Marker advanced slowly, and began to offer his condolences together with those of the wise men who surrounded the girl; but Perr interrupted him with all the sharpness of misfortune.

"It is easy for those who have escaped from sorrow and grief to recommend courage to others," said he. "The king does not take from Ivon Marker the seven best years of his life; and he will remain within hearing of the church bell, while we go away to the sound of the drum."

"You are right, my poor friend," said the young *gars*; "in this instance my fate will be better than yours, and do not think that I forget it. If I speak of patience, it is because it is the best stick on which to lean in a long road; I learn it every day of my life by sad experience."

"And here is a *gars* who has had terrible trials indeed," said Abgrall ironically, without being moved by the gentleness of his neighbour. "What can you want in life, to talk of being obliged to be patient?"

"I want what you have got—relatives free from sickness, and the means to keep my parents in their old age free from misery. Every man has his own misfortunes."

"Verily I would change with you readily," said Abgrall, in a more friendly tone, but with a despairing gesture.

"That might be done," said Maharitte's uncle, who had remained quite still.

The two young men looked much surprised.

"Let us suppose that fortune had changed your numbers in the hat; Perr would now be in the place of Ivon. Why cannot that be done now?"

"That is to say, that Marker will be a soldier in my place," said the young miller quietly.

"And who will do the work at our house?" replied Ivon.

"As for that," said the uncle, with all the slowness of a peasant about to make a bargain, "it might be done in a friendly way; we ask nothing of you that can harm you."

"That is to say, you want to buy me," said Ivon, rather offended at a proposition which placed him on a level with what are thought to be a very degraded class of the community in France—the military substitutes.

"When one offers to buy, he fixes a price: I have promised nothing," said the peasant. "But you are so good a lad that you might do of your own accord what others would do from bad motives. After all, a man is not ruined because he becomes a soldier."

"That is true, father Salaun," replied Ivon, who was very pensive. "You have put a new idea in my head. When I saw those who love me in want of me, I could never have thought of leaving them; but if, on the other hand, my absence would be of any service to them, I would not refuse out of cowardice or timidity of character."

"Well, then, let us walk together, and we will talk; just wait a moment while I send away the women, and I will come with you."

He turned towards Maharitte, whom her mother and sisters were consoling, spoke to them in a low tone, and induced them to return towards their house; then coming back to Ivon with the young miller, they all three followed the road to the farm. The old peasant, as they went along, renewed his efforts with Marker, laying great weight on the wants of his family. He had not much difficulty in proving to him, that despite all his efforts, their poverty was advancing towards misery into which they would soon fall.

The thoughts of the young *gars* had brought him to the same conclusion, and the idea which the speaker had given him had opened to his mind a new career, into which he advanced with intense eagerness. His heart was generous and devoted. He accepted, then, the sacrifice, and did not want to bargain. He therefore endeavoured to bring the negotiation to an end, while the peasant was slowly debating.

"Come now, father Salaun, there is but one word needs speaking," cried he, stopping; "you have opened up to my view a means of safety for my family, quite new. Do not, however, lose so much time in telling me that my friends have not all they want, but tell me at once what you and Abgrall will give me for seven years of my life."

"What a hurry you are in," cried the peasant, a little taken aback at this way of doing business; with these peasants you must transact an affair as you would drink a pot of cider.

"I have not yet said that we want a substitute for Abgrall."

"Good morning, then; for nothing remains to be said," exclaimed Ivon, making a motion as if to go.

"But, young man, what a hurry you are in," replied Salaun, holding him; "before we can make serious propositions, we must know what you want for your relatives?"

"In the first place," said Ivon, with decision—for he was determined his sacrifice should be useful to them—"I want a pair of oxen for the plough and other work."

"A pair of oxen," said the peasant; "how fast you go, my *gars*; do you know that is a good bit of money?"

"I want also a three-year-old cow," said Marker.

"Again."

"And one hundred crowns to pay wages to the two farm boys, who will keep the farm going in my absence."

Salaun and the young miller protested that this was extravagant; they tried to prove to Ivon that he was asking double

DEPARTURE OF THE CONSCRIPT.

what he ought to hope to receive. The *gars* let them speak, and was satisfied with replying, that he would sell himself in the town, where some shopkeeper's son would give him, not goods, but money. After a long discussion, which lasted several hours, the family of the miller was obliged at length to yield to the conditions of Marker.

His last difficulty remained, and that was to gain the consent of his own family. If the agreement were known, he feared that some shame would attach to it among his companions, who all despised the ordinary substitute; while his family might refuse to accept comforts paid for by the liberty, and perhaps the blood of their son. Even if they did resign themselves to it, he poisoned their prosperity, and forced them to feel remorse for their very joy.

The notary who drew up the deed advised secrecy. The number which the young miller obtained by the will of Ivon, he could be supposed to have drawn. As for the money

RETURN OF THE CONSCRIPT.

which paid for his liberty, the notary could feign to have received it as a legacy from a distant relative. All was settled; Abgrall and his friends promised to be discreet, and naught remained but to break the bad news to the Markers. It was a sad moment for them, particularly for the poor mother. There was, before the departure, many an outburst of grief, which Ivon repressed with difficulty. He himself was sad unto death to quit all those who loved him, and by whom he was beloved; and yet the thought of the good he was doing, sustained and supported him. It was a comfort to him, too, that he had never betrayed the love he felt for the sister of Abgrall.

The day of separation came; while the father, weak and ill, held his hand as if he could have never left it; his mother leaned her head upon his shoulder, half fainting with grief; the young sister and the little boy wept; even the dog seemed sad to lose his master. But the conscripts are called out by name in the village; the rolling of the drum summoned the laggers; a last embrace was given, and Ivon rejoined his companions and went on his way.

All seemed right as long as the village steeple was in sight, as long as the same kind of familiar vegetation was seen, the same landscape; but soon vines took the place of apple-trees, vast plains of the little fields, surrounded by quickset hedges; white houses with red and slated roofs replaced the *granite* cabins covered with thatch. Then Marker knew that he had left his country and was an exile.

On reaching his regiment, he had to bow to new habits and divide his days between stupid exercises and idle hours. Mixed up with men who knew not his native idiom, Marker lived isolated; soon the sadness he had cast off fell upon him again like a cloud he could not escape from. All filled him with *ennui*. The fever of absence, which mines away the constitution, destroyed his energy; nostalgia, each day more intense, drove him to the hospital, where the very calmness of the existence added again to it. Everything combined to increase its force. Several months elapsed before any news came from his country. None knew how to write at the farm, and this fatal ignorance separated the absent almost as much as death.

Ivon became worse; life was fading slowly away like the rippling of the waters of a lake agitated by a faint breeze. He dragged himself about like a ghost along the court of the infirmary, following with his eye the bird that crossed the sky, or watching the man on the summit of the old wall. Flowers, man, birds, all reminded him of his native land.

One evening he was sitting sad and exhausted on a bench in the yard, thinking, as was his wont, of the old farm-house. He thought he saw the old fallows, through which, whistling as he went, he drove his lean pair of oxen; the little field crossed by the stream that turned the wheels of Abgrall's mill; the dark hills covered by black sheep; and he seemed to hear the songs of the *patours*. Such was the intensity of his

thought that memory became a living image; he saw all that he recollected, and then he heard the bagpiper without. Ivon stood up. The performer was playing the old familiar airs, which he had so often heard on the green where the boys and girls met to dance of an evening. The poor conscript ran to the gate—it was closed; he went into the barracks, and looked out of a window. The street was deserted, and there was no bagpiper to be seen.

He thought it must be a dream, when up came a sister of charity, and gave him a letter. He thanked her, and asked her to read it. It was from the notary, and written in the name of the parents to announce to the young man the fortunate change brought about by the supposed legacy. Thanks to this, they had hired workmen, bought a pair of oxen, and were doing better than they had done for years.

Marker was happy. He was rewarded. His illness vanished; and having tasted of the delights of communication by letter, he determined to learn to write. He entered the regimental school, and by hard work—very hard work it is at his age—he did learn, and at the end of a year could write a letter. Having once acquired a taste for study, he continued, and his time being taken up by the school and the regiment, the hours passed with extreme rapidity, while his good conduct elevated him to the position of sapper.

At last the seven years were up, and away went Marker. How he walked, how he took double journeys! At last, there is the village steeple—how his heart beats! He begins to feel excited beyond all control—he runs—he upsets some old friends in the market-place; the children run away frightened at his beard; his young sister starts back alarmed; but the dog knows him, and then out comes his mother to welcome her son. She is happy now, for all her children are at home.

And the restored health of his father, the comfort of the farm, the happiness of all around, are rewards enough for Ivon; especially when Abgrall tells the truth, and brings down blessings on his head. But who shall tell the gentle delight of the young man when he found that she, who had guessed his unspoken love, had waited for him? Truly happy was the man now from the sacrifice of the youth.

LETTER FROM CONSTANTINOPLE.—II.

———, 1853.

I HAVE had an opportunity of seeing the reigning sovereign of Turkey, Abdul Medjid, and I gazed with considerable interest at a man who is likely to have so great a position in history by the adventitious circumstances of the contest which is going on. He is very different in personal appearance from the reformer Mahmoud, who sat his horse like a true Turk of the old school; burley, robust, and a hardy soldier, who doubtless would have lived to a good old age had he not have given way too much to inebriety. Brandy killed Mahmoud, and it has not been without its effect on the present sovereign, who has suffered much from inflammatory disease, consequent on too little caution in the use of *raki*.

Drunkenness, which is leaving the Old World, we would fain hope, appears to have taken refuge in the East, despite the edicts and tenets of the law and the prophet. The grave old Moslem smokes now with spirits instead of coffee. Some time ago, the government, convinced of the great evil of habitual intoxication in the people, enacted a stringent law, which punished with the bastinado all persons retailing or consuming ardent liquors. It was, however, evaded and fell into disuse. A certain company of police agents made something out of it, however. They dressed up one of their number as a Copt, and placed him in a shop in a certain street, where dwelt at that time a cunning Greek who saw the house opened for the sale of *raki*. Presently, a Greek came by, and was coaxed into the shop; *raki* was offered him; the man refused, alluded to the law, but finally was coaxed to disobey the edict. He then went away, and about ten yards off was accosted by two police agents, who declared he had been drinking, the smell, they said, betrayed him, and they gave him the option of paying a sum of money, or going to the police-office, where the bastinado would be the punishment.

The liquor-loving Greek paid the fine and went his way. In the course of a few hours dozens were entrapped; but the Greek noticed with some curiosity that no Jews were caught, none ever coming that way. He sallied forth, then, to fathom this mystery, and going to the corner of the street, saw an aged Hebrew, selling rhubarb, who, whenever a Jew came up and would have turned down the street, made some sign which caused the descendant of Moses to start and go his way. Incensed that the Jews were thus able to escape, he went and told the police, who thrashed the old man, and soon caught plenty of Jews in the net. In these instances they poured the *raki* down the unfortunate men's throats.

Abdul Medjid is slight and sallow-looking, while the general outline of his physiognomy is effeminate, but pleasant. There is a sad gentleness about him, a look as if he were weary of the world, which is very touching. His eyes are habitually half closed. There can be no doubt that the Sultan is a man naturally well-disposed. He came to the throne at seventeen, surrounded by all the fearful influences which always encircle a Turkish sovereign. A harem of ignorant women, some six hundred wives, a herd of slaves, cringing and humble courtiers, are not good teachers for a royal scholar of seventeen. Abdul Medjid has unquestionably succumbed to the moral malaria, the pestilence of Turkish vice. And yet he is of a kindly and generous nature, which, in trying times, rises superior to custom and habit.

Thus he did not strangle his brother on his accession to the throne; but he confined him closely to the palace, for fear of his becoming the nucleus of a party. Then he has not been able to put down the fearful infanticides which are daily committed to prevent dangerous princes near the throne, the children of his sisters. But he has decreased capital punishments, and made justice mild and gentle in Constantinople. Executions are now very rare in this city; some years ago they were almost of daily occurrence. Macfarlane has given a very correct account of the terrible excitement which was felt in Constantinople a few years back, when a renegade was about to be executed. This man had abandoned Christianity for Mohammedanism, and then repenting, had returned to his real religion. To abandon the creed of the prophet is death, and it may be easily understood, with such laws, how difficult it is to make converts.

The man was accordingly condemned to death, and the day of execution arrived. One would have thought that the religious prejudices of the Turks would have been aroused, and that they would have flocked to see the recreant *giaour* die. Not so. They remained shut up in their houses; the soldiers refused to act as executioners; and at last it was found necessary to bribe a Nubian slave, who trembled so violently when performing his office, that he had to strike three blows before the head of the unhappy wretch fell off.

The Sultan's marked courtesy in public and private to Western Europeans and Americans is imitated by all classes of Turks. This produces very pleasing results. It is a marked change from the state of things three years ago. But everything is changed. There are now decent hotels and decent lodging-houses, and the streets are becoming safe at night, and there are not so many exactions and insolences.

But everything has to be done before this country can be called reformed. The way is paved; the eyes of the Turks are beginning to be opened. They are beginning to see and appreciate the blessings of commerce and trade, and thoughtful men from western Europe have shown them the immense advantages they may derive from cultivating their land, and encouraging agriculture by every means in their power. Agriculture has been almost null hitherto in a country governed upon the most barbarous and illogical principles. For ages the Turk lived rather by rapine and plunder than by production. He did not understand the blessings of a happy and contented peasantry, occupied in peaceably creating wealth. The *rayahs* were accordingly pillaged, taxed, ill-used in the most outrageous manner. The way these things were done was fearful.

The government sold a province to a pacha; he sold parts

of the province to *seraffs*, or Armenian bankers, at enormous profits; they again sold the villages and hamlets to police agents and tax-gatherers. These individuals went about rating people at what they liked, utterly regardless of the custom which gave to the heads of the village the right to fix the quota of taxation. As the more land a man cultivated, the more heavily in proportion was he taxed, men ceased to cultivate, except from pure necessity. Then, if a man could not raise the sum demanded, he was beaten and left for dead, his next-door neighbour paying the deficiency. The *haratz*, or capitation tax, paid by all Christians for permission to live, was collected in a barbarous way. It commenced at eighteen, and as in Turkey there are no registrars of births, deaths, and marriages, it was difficult to decide a man's age. The Greeks always denied being eighteen. The Turkish tax-gatherers in the distant provinces decided the question by measuring the man's head.

This system of rule naturally resulted in whole tracts being left desolate, in agriculture being neglected, in the country being in a most wretched and impoverished state. But in many provinces, especially the semi-independent ones, the Turks have yielded to the spirit of the age, and are showing a disposition, at all events, to relax the severity of their rule, and treat their Christian dependents like men. The vastly increased revenue, the wealth, riches, and prosperity of the country, will soon prove the importance of these relaxations and reforms.

The first attempts at agricultural reform and education were total failures, from the peculation, inaptitude, and ignorance of the men who had charge of the affair. The efforts of the few earnest and practical Europeans and Americans failed utterly before such persons as Achmet Fethi Pacha. But renewed efforts have been made, and now the agricultural schools are beginning in earnest, and a certain number of the pupils seem apt, docile, and intelligent. This, with perfect liberty of action to the active and versatile Greek *rayah*, will soon work a great and mighty change.

Hitherto, the Christians—the Armenians excepted, who are the humble and abject servitors of the Turk—have been compelled to conceal whatever little wealth they possessed. A melancholy proof of the great oppression suffered by the *rayahs* in past years exists in the fact that *every* Christian in Turkey, who has the means to do so, has purchased the protection of some foreign government—has naturalised himself a Swede, a Russian, a Greek of the Otho monarchy, an Austrian, or a Swiss. This once done, he appeals in every case of oppression to his consul, and he is sure of protection. It has been by cunningly encouraging this, making the naturalisation easy, and then giving him, right or wrong, protection of the most hearty character, that Russia has won her way with some of the Greeks.

The enlightened few among the Turks, who have influenced the government to enter warmly on a career of reform, will soon reap the benefit. Already agriculture is progressing; commerce has grown rapidly; the Christian race are beginning to feel hope and confidence; and although the undying hatred of the slave will never be eradicated as long as the religion of Mahomet flourishes above Christianity, or until an amalgamation takes place, it is quite clear that Turkey has made an onward march. It is a question whether she will ultimately be saved as Turkey; but it is clear to my mind that England cannot allow Russia to clutch this fair portion of the earth, or to erect a throne here, which would depend in the least degree on her for support.

I am more than ever struck with the natural advantages possessed by this city. In the hands of an unscrupulous and ambitious power like Russia, Constantinople would command the Mediterranean. Under Russia, the races would be amalgamated in earnest—that is, cut down to the level of Finlanders and Siberian savages. She would introduce here, probably, the serf system, fortify the city so as to render it impregnable, and deprive all other nations of a share in the commerce of the Black Sea.

The bridge which connects the two sides of the fort is a very great improvement on the old system of taking a *caique*. It appears to be a remarkably good speculation. It is a bridge of boats, part of which is moveable, so that ships of the line can pass when necessary. A company of infantry seem to make little impression on it.

There is a mighty change indeed, within five years, in the appearance of the soldiery. In 1848-9, we could at any time point out a sentry, with his gun against a wall, knitting stockings for a living; himself ill-clothed, slip-shod, dirty. But they have awaked, as it were, from a dream of ages, and the Turkish soldier is as prim, neat, and military in appearance as the Piedmontese or Swiss. I speak, of course, of the picked troops. But I fancy the best fighting men are the Kurds, Circassians, Albanians, Druses, and the wild Asiatic hordes generally, who are even now pouring in at intervals to fill the ranks of the army.

MOUZON.

The French canton of which Mouzon is the principal town is watered by the Meuse and the little river of Chiers. The land is very good for agricultural purposes in the deep valleys and broad prairies with which the department abounds; but the lofty mountains and the craggy rocks are almost destitute of verdure. Yet even these old gray hills are clothed here and there with splendid vineyards, where, beneath the cheerful influence of the southern sun, the grapes ripen rapidly and fully, and are esteemed the best in the neighbourhood. The old French proverb speaks of these vineyards in terms of flattery. "Heaven preserve to us," it says, "the justice of Omont, the bread of Sapogne, and the wine of Mouzon." Besides the vineyards on the mountains, the valleys, and wide-stretching prairies, the locality is famous for extensive forests—forests which some of our English poets have peopled with creatures of their imagination, and given by this new interest to the place.

One remarkable place is the old city of Beaumont, fortified in 1112 by William "of the white hands," archbishop of Rheims, who succeeded in securing for the people of the city certain privileges and immunities, which were afterwards known as the laws of Beaumont. Charles VII., king of France, obtained possession of Beaumont at the same time that Mouzon fell into his hands; and in 1379 Mouzon was considered the greatest of all the provinces of Champagne.

Douzy, on the banks of the Chiers, given to St. Remi by Clodoald, son of Clodimir, is the property of the bishops of Rheims. There they possess a palace and a park. In the thirteenth century the city was fortified, and surrounded by walls and a broad moat. At Douzy two church councils have been held; one in 871 and the other in 874.

Villiers, near Mouzon, formerly possessed a *château*, which, although strongly defended, was destroyed in 1536, for fear it should fall into the hands of the Leaguers during the civil disturbances which were then devastating France.

The lordship of Mouzon is of very ancient date. It was reckoned among the possessions of the famous abbey of St. Hubert, which was founded in the eighth century by the kings of France, and under their protection enjoyed a sort of independence till 1789. Every year, in the month of July, the abbot sent to the king a present of hawks and hounds. This presentation was invariably the occasion of a great festival. The king receiving them with great condescension, the men who brought them were most liberally rewarded, and alms were returned for distribution among the poor of St. Hubert.

Mouzon, described in the "Roman Itinerary" as Mosomagus, is the capital of the lordship, and formerly possessed a strong castle, which castle was burnt down by the Normans, and a monastery, or religious house, built on its site.

The church of Mouzon is one of the most important in the department of Ardennes. It was founded in the fourteenth century, and is remarkable for the regularity of its construction, the richness of the ornamental work with which it is adorned, and for the sculptured figures on the portal.

Independently of this church there was another, in olden times, dedicated to St. Genevieve, and situated in the environs of the city. The church afterwards became a convent of Capuchin friars, and the ground is now occupied by a municipal hall.

THE CHURCH OF MOUZON.

THE FALLS OF ITAMARITY, NEAR RIO JANEIRO.

The cataract represented in our engraving consists, says Sir W. G. Ouseley, from whose portfolio it is copied, of a succession of three waterfalls, subsiding into rapids, and then continuing its course as a turbulent rocky brook, working its way among the hills of the Serra de Estrella. The Falls of Itamarity are not near any high road, and have been seldom visited by Europeans. It is not possible to obtain a general view of all the falls. That which we present to the reader is taken from an insulated rock, standing opposite the second fall. The first fall has worked a basin in the rock, as in other similar sites, and, as usual, it is asserted by the natives to be of vast or fathomless depth. Below the isolated rock is a third fall of considerable size; but the rich and thick vegetation prevents much of it from being seen. On the morning that this sketch was taken, when a party visited the Falls, some negroes were sent on beforehand to cut away the underwood and parasites, and to fell trees in order to *improviser* a bridge for the nonce. The ligatures used in fastening the

THE FALLS OF ITAMARITY.

trees, and the sort of parapet railing, were made of the lianes or parasitical plants from the surrounding trees. They hang from the highest branches like ropes of various sizes, some little larger than whipcord, others of the circumference of a large cable; indeed, they are often thicker than a man's body, and frequently form spiral and intricate knots, like the writhings of gigantic serpents, à la Laocoon. The profuse variety of growth and rapid vegetation in this part of Brazil is scarcely credible to Europeans. A very few weeks, or rather days, after this path had been opened, and the bridge constructed to enable the party to visit these Falls, strangers might have passed close to them, only made aware of their proximity by the loud roar of the falling waters, the hoarse sound of which, deadened and rendered deceptive by the close growth of the forest, would be but an indifferent guide, and hardly enable them to find any approach by which to obtain a view of the Falls. The negroes and country people have alarming stories or traditions respecting vast crocodiles, differing from the common sort in their nature and habits, and unlike the alligators of the rivers emptying themselves directly into the bay of Rio de Janeiro, at the foot of these mountains. They are said to be infinitely larger and more voracious than their relations near the salt water. These monsters, they affirm, inhabit the deep pools formed occasionally in the course of the mountain rivers. Poisonous snakes are asserted to be often found in these waters. The present existence of these crocodiles seems very apocryphal; nor are serpents so often met with, even by naturalists anxious to enrich their collections, as is generally supposed. The name of these Falls, "Itamariti," or "Itamarity," signifies in the Indian language (probably that of the Guarani tribe) "the shining stones," or "the rock that shines," doubtless so called from the glittering appearance of the large mass of rock, the face of which is worn smooth by the water. "Ita" means stone or rock.

The old road over the Serra de Estrella, constructed when Brazil was a colony of Portugal, was, although much too steep according to modern ideas of engineering, infinitely better than the track dignified with the name of road, formerly leading to the Serra dos Orgaos. Being paved, it was at least safe and practicable. But the road recently opened to these heights is on vastly improved principles, and on a scale thought even unnecessarily large. The foundation and progress, however, of the new city of Petropolis, situated at the height of about 3,000 feet above the level of the sea, on this route, has doubtless called for the construction of a road wider and more convenient than those hitherto made in this part of the country. The emperor has built a summer residence here, near the highest part of the road, and the court and many of the wealthier citizens of Rio Janeiro have followed the example, encouraged by his Imperial Majesty's liberal allotment of land for dwelling-houses, hotels, etc. The idea of founding this mountain city as a retreat during the great heats originated with the late emperor, Don Pedro I., who made grants of land, absolutely or conditionally, to different noblemen of his court. He was not enabled, however, to carry into effect either his plan for a city or the construction of a new road to and through the mountains. To the reigning emperor belongs the credit of practically calling into existence this thriving and healthy settlement, of which the success is now beyond a doubt. Petropolis may now be regarded as like the Royal Sitios in Spain—Aranjuez, La Granja, etc., to which the court regularly removes at certain seasons. The temperature and climate are delightful, and the annual removal to this and to other Serras is sufficient to restore to health those who have suffered from the enervating heats of the summer in the low lands around the capital. European invalids especially derive great benefit during convalescence from a few weeks' stay in these picturesque mountains. Many foreigners, particularly Germans, have settled at or near this city. To the naturalist, and more particularly to the entomologist and botanist, a sojourn in these Serras affords endless interest and employment. A railroad is now opened from Rio Janeiro to the foot of the hills, which promises great advantages to the new settlement.

NATURAL PRINTING PRESS (NATURSELBST-DRUCK).

Under this term, Louis Auer, of the Imperial Printing-office at Vienna, has patented a process invented by himself in conjunction with Mr. Andrew Worring, overseer of the same establishment, for creating, by means of the original itself, in a swift and simple manner, plates for printing copies of plants, materials, lace, embroideries, originals or copies, containing the most delicate profundities or elevations not to be detected by the human eye," etc. A pamphlet giving a description of this discovery and a series of specimens has reached us. The examples consist of an impression from a fossil fish, from agates, the leaves of trees, several plants, mosses, algæ, and the wing of a bat. These are all printed in the natural colour of the objects they represent; and it is difficult to conceive anything more real than these productions. The general character of the process is told in the following pithy manner by Louis Auer, in the introductory paragraphs of his pamphlet:—

"Query.—How can, in a few seconds, and almost without cost, a plate for printing be obtained from any original, bearing a striking resemblance to it in every particular, without the aid of an engraver, designer, etc.?

"Solution.—If the original be a plant, a flower, or an insect, a texture, or, in short, any lifeless object whatever, it is passed between a copper plate and a lead plate, through two rollers that are closely screwed together. The original, by means of the pressure, leaves its image impressed with all its peculiar delicacies—with its whole surface, as it were,—on the lead plate. If the colours are applied to this stamped lead plate, as in printing a copper-plate, a copy in the most varying colours, bearing a striking resemblance to the original, is obtained by means of *one single* impression of each plate. If a great number of copies are required, which the lead form on account of its softness, is not capable of furnishing, it is stereotyped, in case of being printed at a typographical press, or galvanised in case of being worked at a copper-plate press, as many times as necessary, and the impressions are taken from the stereotyped or galvanised plate instead of from the lead plate. When a copy of a unique object, which cannot be subjected to pressure, is to be made, the original must be covered with dissolved gutta percha; which form of gutta percha, when removed from the original, is covered with a solution of silver to render it available for a matrix for galvanic multiplication."

This process is also applicable to the purpose of obtaining impressions of fossils, or of the structure of an agate or other stone. In all the varieties of agate, the various layers have different degrees of hardness; therefore, if we take a section of an agate, and expose it to the action of fluoric acid, some parts are corroded, and others not. If ink is at once applied, very beautiful impressions can be at once obtained; but for printing any number, electrotype copies are obtained. These will have precisely the character of an etched plate, and are printed from in the ordinary manner. The silicious portions of fossil, and the stone in which they are embedded, may in like manner be acted upon by acid; and from these either stereotyped or electrotyped copies are obtained for printing from. We learn that Mr. Bradbury, of the firm of Bradbury and Evans, has availed himself of this invention, and that he is now preparing a series of botanical specimens for publication—so that, very shortly, the public will be in possession of examples of this beautiful process. It is not a little singular that the workers in German silver and Britannia metal, at Birmingham, have for some time been in the habit of ornamenting the surfaces of these metals by placing a piece of lace, no matter how delicate, between two plates, and passing these between rollers. In this way every fibre is most faithfully impressed upon the metal. We are not aware, however, that any attempts to print from those impressions have yet been made at Birmingham.

BUTTERFLIES AND THEIR TRANSFORMATIONS.

or long since, few things in the natural history of animals ere regarded as more interesting and surprising than the ries of changes which insects undergo in their progress om the egg to their perfect state. This metamorphosis, as it called, was until very lately supposed peculiar to the class insects; and although the researches of modern naturalists ave shown that changes perhaps still more remarkable occur the lives of many of the lower forms of marine animals, e study of the metamorphoses of insects must always resent much to excite the curiosity and engage the attention the student of nature.

In few insects is this series of changes to be observed greater perfection than in the beautiful tribe of creatures of hich we propose to give some account in the present paper. none can there be a greater difference between the first id last states—the former, a soft, crawling caterpillar, evouring the coarsest vegetable food with an insatiable appe-te—the latter, a delicate, airy being, fluttering in the sunshine om flower to flower, and drawing its sole nourishment from ie honied juices laid up in those natural receptacles. Nor an we find an instance in which the intermediate or pupa tate is more distinctly marked—in which the appearance of eath is more completely simulated, than in these creatures—hence the butterfly has in all ages been regarded as a sort of mblem of the resurrection.

Of all our British butterflies, there is perhaps none more eautiful than the Swallow-tail butterfly (*Papilio Machaon*), epresented in all its stages, in the accompanying woodcut ig. 1.). This handsome insect, the only British representation of a group of which many magnificent species inhabit the unny regions of the tropics, is met with not uncommonly in he fenny districts of this country. The caterpillar, which eeds principally upon the fennel and wild carrot, is of considerable size when fully grown; it is of a beautiful green olour, with numerous black rings looking like bands of black elvet, alternately plain and spotted with red. The body, s in all caterpillars, consists of twelve segments besides the ead, and the creature crawls upon sixteen feet—three pairs f short, jointed legs, which are afterwards converted into he long slender legs of the butterfly, being attached to the hree segments immediately following the head, and five airs of soft membranous feet, which disappear in the perfect nsect, supporting the hinder part of the body. This caterpillar presents a singular character, which serves to distinguish it at once from all other English species, although it s common to all the foreign insects immediately allied to he swallow-tail butterfly; it is furnished with a pair of ittle filaments, capable of being protruded and retracted at leasure from a tubercle situated immediately behind the ead; these form a Y- or V-shaped organ of a red colour, which secretes a fluid of a disagreeable odour, and it is supposed that the caterpillar employs them to frighten away any nsect enemies, such as ichneumons, which may chance to disturb its equanimity by their unwelcome intrusion.

When the caterpillar is full-grown it prepares to change into its second, pupa or chrysalis, state. For this purpose it seeks some suitable spot, where, during the period of deathlike lethargy through which it is now to pass, it may be protected as much as possible from the weather and the assaults of its enemies. Its choice made, it spins a small web of silk, in which it entangles the hooks of its hindmost pair of feet, which are situated quite at the extremity of the body. Many caterpillars are content with attaching themselves by one end in this manner before undergoing this important change; but the chrysalis of the swallow-tail butterfly appears to entertain some objection to swinging freely at the mercy of the wind, and the caterpillar accordingly, directed by unerring instinct, proceeds to form a loop of silk round its middle, by which, when changed into a helpless pupa, it will be kept snugly moored to its resting-place. This effected, it bursts and throws off its skin by various movements of the body, and appears in a form apparently as different from that which it is eventually to assume as from that which it has just quitted. Nevertheless, in the horny case which now encloses all the parts of the future butterfly, the positions of many of its organs are already to be recognised; we see the elevations of the surface of the chrysalis, which are afterwards to be occupied by the wings, the antennæ, and the legs; and as the creature approaches maturity, something even of the colours may be discerned through the integuments. The chrysalis of this insect is of a greenish colour, with a black band on each side. At the end of the appointed time the butterfly emerges from its case; at first soft and weak, with folded and imperfect wings, which, however, soon expand; and at length the creature springs into the air, to sport for awhile with its fellows in the bright sunbeams, to leave behind it the germs of a future generation; and having fulfilled all the ends for which it was called into being, to die, after a short but apparently happy existence, and leave its place to be occupied by others. In beauty of colour and elegance of marking, the swallow-tail yields to none of our British butterflies. Its principal colours are a beautiful sulphur yellow and a deep velvet black, the latter, however, being frequently powdered in the upper wings with single yellow scales, in the lower with similar scales of a pearly blue colour. The lower wings are also furnished with a black tail and marked with a beautiful red eye-like spot on the inner apical angle. Our figure of the English swallow-tail represents the butterfly soon after its emergence from the chrysalis and before the wings have attained their full development; but the form of the tail and the position of the eye-like spot in the hinder wings are well shown in the accompanying figure of a very nearly allied butterfly, the *Papilio Podalirius* (fig. 2.), a native of the southern countries of Europe, and long reputed a British insect.

Another very handsome insect, allied to the preceding, is the Apollo butterfly (*Parnassius Apollo*, fig. 3.), which may be found by some of our summer tourists in the Alpine districts of the continent. The ground colour of this charming insect is white; the fore-wings have each three or four black spots, whilst the hinder wings are adorned above with two, beneath with three, red eye-like spots, generally surrounded by a black ring, and furnished with a small white pupil. It is found in all the mountainous parts of Europe, and even in Siberia; but although it has been said to be an inhabitant of the highlands of Scotland, its occurrence in Britain is more than doubtful. The caterpillar of the Apollo butterfly also possesses the singular forked organ at the back of the neck, but this is wanting in all the following species.

A very pretty little butterfly, which is found in many parts of England, and is generally distributed on the continent, is the Marbled-white butterfly (*Arge Galathea*, fig. 4.). It is met with in meadows in the neighbourhood of woods, where the caterpillar feeds upon the common cat's-tail grass. Contrary to the usual practice of its relations, the chrysalis of this butterfly does not attach itself to any object, but lies upon the bare ground. The butterfly is yellowish white, spotted with black.

Several species of the genus *Hesperia* are found in this country, where they are known to collectors by the name of "Skippers," from the curious jerking motions of the animal during flight. They inhabit woods and gardens, and although their stout bodies and strong wings indicate considerable power of flight, they rarely fly to any distance, but take their rapid, jerking course from one resting-place to another. The species represented in fig. 5 is generally distributed on the continent, but is not met with in this country. Like most of its allies, its appearance is very plain; the general colour being brown; but the lower surface of the hinder wings is greyish, with about a dozen large white spots, each surrounded by a black border.

Of these butterflies the caterpillars are naked; but a great number are clothed with hairs or spines, which in some cases

serve as formidable weapons of defence. In the genus *Vanessa*, to which the well-known and beautiful Tortoise-shell and Peacock butterflies belong, the caterpillars are covered with spines, which are frequently curiously toothed. One species of this genus, the *Vanessa Antiopa*, or Camberwell Beauty (fig. 6.), is remarkable from its appearing in certain seasons in profusion in almost all parts of the country, and afterwards occurring sometimes for many years only in individual specimens in different localities. The cause of this singular phenomenon is still unexplained; but it is remarkable that several other species of the genus *Vanessa* are in the habit of appearing occasionally in vast numbers in particular localities, giving rise, from their depositing a red liquid on various objects before rising into the air, to the numerous accounts of bloody rain which are to be met with in old writers. The Camberwell Beauty is a very handsome insect; the wings are of a deep rich chocolate brown

colour, surrounded by a white or pale yellowish border; within this the wings are black, with a row of bluish spots.

The caterpillar of the White Admiral butterfly (*Limenitis Sibylla*, fig. 7.) is also armed on the back with spines; but these, instead of being long and toothed, are short and forked, and the animal is also clothed with stout hairs. The butterfly is of a blackish colour, with an irregular white band running through all the wings. It is one of the most graceful of British butterflies in its manner of flight, but is by no means common. The caterpillar feeds on the honeysuckle; it is of a green colour, with the head, legs, and spines of a rusty red; the chrysalis is green spotted with gold. Nearly allied to this species is the Purple Emperor butterfly (*Apatura Iris*), one of the most beautiful of the British species. The wings are black, with bands and spots of white arranged somewhat as in the white admiral; but the black surface in certain lights reflects a most brilliant mazarine blue or purple colour, which adds greatly to the beauty of the insect. From the great height at which it usually flies it has obtained the name of the Purple High-flier, and its great power of wing renders its capture by no means an easy matter. With this charming insect we shall take leave of our readers, assuring them that they will find in the study of the transformations and habits, even of our commonest English butterflies, a source of interest and amusement which perhaps they would little suspect.

RAMBLES IN DOWNSHIRE: PORTAFERRY, AND A TALE OF '98.

"Old Portaferry in sweet County Down."—*Old Song.*

It was a splendid morning on which I reached Belfast to start by rail for Portaferry. Often had I heard of that lovely place, but, somehow or other, never had I before wended my way thither. Honest, light-hearted, brave seamen had I met frequently in various places, and coming from all parts of the world, who spoke fondly of Portaferry as their home. I longed to see it, to view its romantic scenery, to wander along its shore, and sail over its waters, on which, as is well known, some of our most intrepid and skilful mariners in childhood learnt to love the sea and were trained to brave its dangers.

Away we sped from amid the bustle and din and smoke of the busy town—the noble Athens of Ulster—as on the wings of the wind. I was alone in the carriage for a time, but just before starting two others entered—a mother and her child. She was a widow, young and in sad mourner's garb. How early had Death entered her home, and buried her affections in the grave of him she loved! Her little girl was about four years of age. She was a lovely child, fair as a lily, with bright blue eyes, and flaxen hair waving in golden curls about her face. Afterwards I heard their history. They were

highly respectable natives of the South. Several years ago the family had come from the South in straitened circumstances. During the fearful visitation of cholera in 1849, Mr. P—— fell its victim. The heart-broken widow, with her only child, continued to reside in the locality. Periodically the mother and her little daughter, I was told, visited her husband's grave. During the spring and summer months they strewed flowers on it; and while the widow sat by her dead one's tomb for hours, the child would be seen running among the graves, plucking the wild flowers and chasing the insects hovering about them, little aware of the heavy sorrow crushing her mother's heart, and of the terrible loss she had sustained in that hour—how faintly remembered by her!—when she was lifted up to gaze for the last time on the coffined dead, and was told she was fatherless.

We parted at Newtonards. God bless that widow and her fatherless child! From the railway carriage I was transferred to a seat on a one-horse car. Beside me there sat a young seaman. He was returning from a trip up the Mediterranean in a swift London clipper. He was a merry-hearted fellow. He had all the cut of a crack seaman. "His skipper," he said, "was a drunken old brazen nose, and he had quit his command right heartily." He had made, he informed me, twenty pounds by his voyage.

"You have a good deal of that sum home with you, no doubt?" I said.

"Just six pounds," was the reply. "London made a death on most of my shiners. No matter. I have what will do me for a week or two. There's no one now depending on me. The old people, for whom I used to save all, are away."

"Your parents are dead, then?" I said.

"Aye, aye, sir. The old man went off last. I would have liked to have seen him before they *hopped* up his white head under the sod. But I was on the sea. I came home, but the old home was no more open to me. I'm goin' now only to see my old neighbours and playmates. Hillo, my hearty!" addressing the driver, who sat on the opposite side, "give us a song, old boy. The road won't be so dreary, if we have a stave."

"Me sing!" exclaimed our whip. "You might just as well expect a song from a turnip. I never, all my life, could sing or whistle. Give us a stave yourself."

"Here goes then;" and in a manly, and not unmusical voice, the seaman sang "Pat's Farewell to Green Erin;" a song he had learnt, he said, in an emigrant ship. I just remember the first verse:—

> "'Twas on a fine May morning
> All in the month of *June*,
> That we set sail for Ameriky
> In the noble ship 'Neptune,'
> Our captain was a sailor brave,
> And fearless hearts the crew;
> And with sails all spread our gallant ship
> O'er the *roullin'* billows flew."

The same song I have often heard. The tune is a fine national one, however otherwise may be the sentiment and versification of the ballad. It was, as many know, a peculiar favourite of the Irish emigrants.

As the song ended we took up another passenger, a curious-looking genius. He was a regular prig, on the wrong side of sixty, and dressed out most ostentatiously. One would have fancied him prepared for a wedding. And it turned out, in fact, that he was wearing his marriage garments. Certainly, he was no beauty; nor, one would have thought, likely to have taken any woman's fancy. He was an Englishman—a cockney. He had been in the navy—a marine, probably. But he spoke of "Commander" this, and "Admiral" that, as having been his "pertikler friends—sworn brothers." Sir Charles Napier especially he claimed as his other self. They were, according to his vapid representations, kindred spirits, fast and bosom friends. I thought to myself: Oh! if the veteran Charlie heard your gammon just now, old Puff, how he would tatter your frizzed, greasy wig (his cranium bore an odious one), and rattle his stout cane over your toggery.

"You're a stranger here, I presume?" I said, addressing the old coxcomb.

"Why yes, sir; and yet here, Fate has it, I am to settle down. I have been over the world, and over the ocean too but I must say—Hireland for me! I've been here only ten days, and I've found a wife. I must say—the Hirish girls for me! Splendid creatures they are—oh, splendid! I was married yesterday. In fact, I'm just now out of the bridal chamber; and say what people will against matrimony, I must say, I don't rue."

"That's right, and I hope you never will," I could not but remark.

"I feel sure I shan't. No, I shall never rue. A fine, charming creature she is; and so fond of me! I must say, I am really 'appy! I am going to Portaferry to look for a little snuggery where we can live, and, as the Missus sings, 'enjoy love in a cottage with roses.' I shall turn hagriculturist, I think; and we shall rear all kinds of things. 'My dear,' I said to the Missus this morning, we shall live as 'appy as kings and queens. I shall beat up about Portaferry for a small cottage and farm; and we shall grow everything, and rear up——' "

"Lots of youngsters, I hope you told her," interrupted my sailor friend, who had been vastly enjoying the colloquy.

"Why, I did'nt just say so," said the bridegroom, attempting to look rather shy; "but I must say, when the dear little ones *do* come, they shall be welcome. But here's Portaferry."

I parted from both my companions, wishing the bridegroom all happiness, and receiving a squeeze (something like a crush in a vice) from the brawny hand of the warm-hearted sailor.

Portaferry is an old town. Its name is derived, some have supposed, from Porth, signifying terrible, and Ferry, that is, the terrible Ferry. Others, however, say that the very early name of the place was, the Port of the Ferry, and that in course of time, that was abbreviated into one word—Portaferry. The situation of this ancient town is beautiful. It lies on the shore of Lough Strangford—not far from the entrance of the Lough. On the other side of the ferry, and directly opposite (a distance of a mile), is the pretty village of Strangford. Standing on the shore, to the right, stretches the far-famed Lough, in which it is said there are as many islands as there are days in a year. Looking in this direction, a great variety of interesting objects attract the eye. At the time when first I saw these objects, I had an enchanting view of them. The evening was still and beautiful; the sun, amid golden splendours, was setting in the west; the waters of the Lough were as a sheet of glass; several boats were moving slowly towards, or were coming from among the islands, their snow-white sails flapping about the masts (there was hardly a breath of wind); while the richly cultivated fields and distant hills seemed covered with lustre. There is seen first the ancient ruins of Audley Castle (of which more anon); further on is the entrance to the Quoile, the river leading to Downpatrick (where St. Patrick's dust reposes); beyond, about five miles distant, appears the village of Killileagh, known as the residence of one of the most profound living scholars, Doctor Edward Hincks, and formerly the residence also of Dr. Henry Cooke, now of Belfast, the most eminent of our brilliant Irish orators and divines. My attention was next turned to the picturesque scenery directly opposite Portaferry and surrounding Strangford. Beyond that village is Castleward, the favourite residence and estate of Lord Bangor. A capital story is told of one of the late Earls of Bangor, in connexion with his Downshire property. It was believed that his mind had become disordered, and the matter came before the Lord Chancellor, who had the earl summoned to meet him in Dublin. The chancellor, to test the earl's state of mind, spoke to him of his property:—

"Would you sell your estate in Down?" inquired the chancellor.

"Certainly, yes; certainly, my lord," was the reply, "if I get my price for it."

"What might that price be?" interrogated the chancellor, fancying he was satisfactorily drawing out his man.

"Then, I'll sell it, my lord—I'll sell my ancestral estate willingly at just one price——"

"And that is?" interrupted the chancellor.

"At the rate of fourpence a load for every part of the estate—the purchaser binding himself to draw the whole away."

The chancellor was overmatched. All his questions were met as ably. The earl returned home in triumph, free of all the meshes of Chancery.

Beyond Castleward there is a fine range of mountains, bearing different names. Close to Strangford, on the left hand, is the summer residence of Mr. J. Blackwood Price, one of Ireland's best and most popular landlords. To the left is Old Court, the seat of Lord de Ros. The house is built mainly after the Elizabethan style. The grounds about it are very beautiful, but contracted. His lordship was in England during my visit. Some time ago he suffered the loss of one of his daughters, a lovely and most accomplished young lady, and universally beloved by all classes.

But the most interesting locality about Portaferry is the really romantic domain of Major Nugent, the highly esteemed and popular proprietor of the town. It is open to the inhabitants and to all strangers. It is one of the loveliest spots I have visited in any country. The grounds are extensive, and kept at all seasons in admirable order. While there I felt as in fairyland. From parts of the domain are to be obtained glorious views for many miles distant. Here you have the finest views of the lough, and of all the interesting objects on both sides of its shores. Seated, on the second evening of my visit, on one of the green slopes from which we looked down on the lough, I asked my companion if there were any traditions about the old castle of Portaferry, which stands in the town, almost close to the shore, and which is much dilapidated.

"I don't know of any," she replied. "There are five old castles in this county, all in sight of each other, and which have existed, it is said, since the days of King John. The only tale I have heard is about Audley Castle during the Rebellion of '98."

I begged her to relate to me the tale, which she did most kindly, and I give the story in her own words, as well as I can remember them. The tale may bear the title—

THE REBEL OF AUDLEY CASTLE.

A TALE OF THE IRISH REBELLION OF '98.

Some days before the celebrated battle of Ballynahinch, a numerous band of rebels, all Ardsmen, advanced on Portaferry, resolved to take the town and sack it. They were to have been under the command of Charles Maxwell, a young man holding a small property in the Ards, and of respectable connexions. He had heartily thrown himself into the revolutionary movement; and his high character, his position in society, his great popularity with the peasantry, his energy, and his well-known brave and chilvalric spirit caused him to hold a high command under the general-in-chief of the rebel forces, with whom he was intimately acquainted. Maxwell was absent on urgent business connected with the rebellion, when the Ardsmen were induced by unwise counsels to assemble from all parts to advance on Portaferry. They were too precipitate; in the absence of Maxwell they were not under proper command; and, although they made a desperate assault on the town and sacrificed many lives, they were bravely repulsed by the yeomanry under Mr. Nugent, aided by the king's cutter, stationed at Portaferry, commanded by Captain Hopkins, who had anchored his vessel close to the Quay, and swept the streets with his cannon, slaughtering many of the rebels.

Maxwell arrived at the close of the conflict, collected as many as he could of the flying rebels, spent several days increasing their numbers, and finally marched his band to Ballynahinch. In the fiercely-fought and disastrous battle which ensued there between the rebel forces and the royal army, he bore a distinguished part; and when, after a terrible conflict, the former were put to utter rout, Maxwell, slightly wounded, escaped on horseback, and sought security near to Annalong, a small fishing village at the foot of the celebrated Morne mountains. Although unaware of any watch having been on him, yet had he been anxiously observed all the day by one who took no part in the conflict, although in the ranks of the rebels, and who bore towards him most bitter enmity. When in the thick of the conflict, Maxwell, who fought like a lion, and ever led the charges of his men, was beaten back and several times apparently cut down, the spectator referred to was unable to repress his exultation. With muttered execrations he saw Maxwell escape in safety, and following him cautiously in his flight for hours, he traced him to his hiding-place.

Two days afterwards this man might have been observed holding a close conversation with Captain Hopkins, on board the royal cutter, at Portaferry. Within an hour the cutter lifted anchor and made out to the channel.

Once across the Bar, her course was directed towards Annalong, and shortly after eleven o'clock at night she crept in close to the shore, and was anchored near the village. The object of her commander was to make a prisoner of Charles Maxwell; but he was disappointed. A half-witted creature, called Andy Moore, had been gathering shell-fish along the shore until darkness set in. He observed the royal cutter hovering about the offing, and aware of the fugitive rebel being concealed in the neighbourhood, and having been warned to be on the look-out, he at once suspected the cause of the cutter's appearance. He fled to the house, gave the alarm, and before the cutter had come to at Annalong, Charles Maxwell was away up the mountains, having Andy Moore as his guide. In this way he escaped; and, still accompanied by Moore, on the second night after his flight from Annalong, they reached Audley Castle. Maxwell was drawn to the locality of Strangford by a love affair. He was engaged to a beautiful young girl, the daughter of a most respectable farmer in the neighbourhood; and he wished to see her before leaving the country, perhaps for ever.

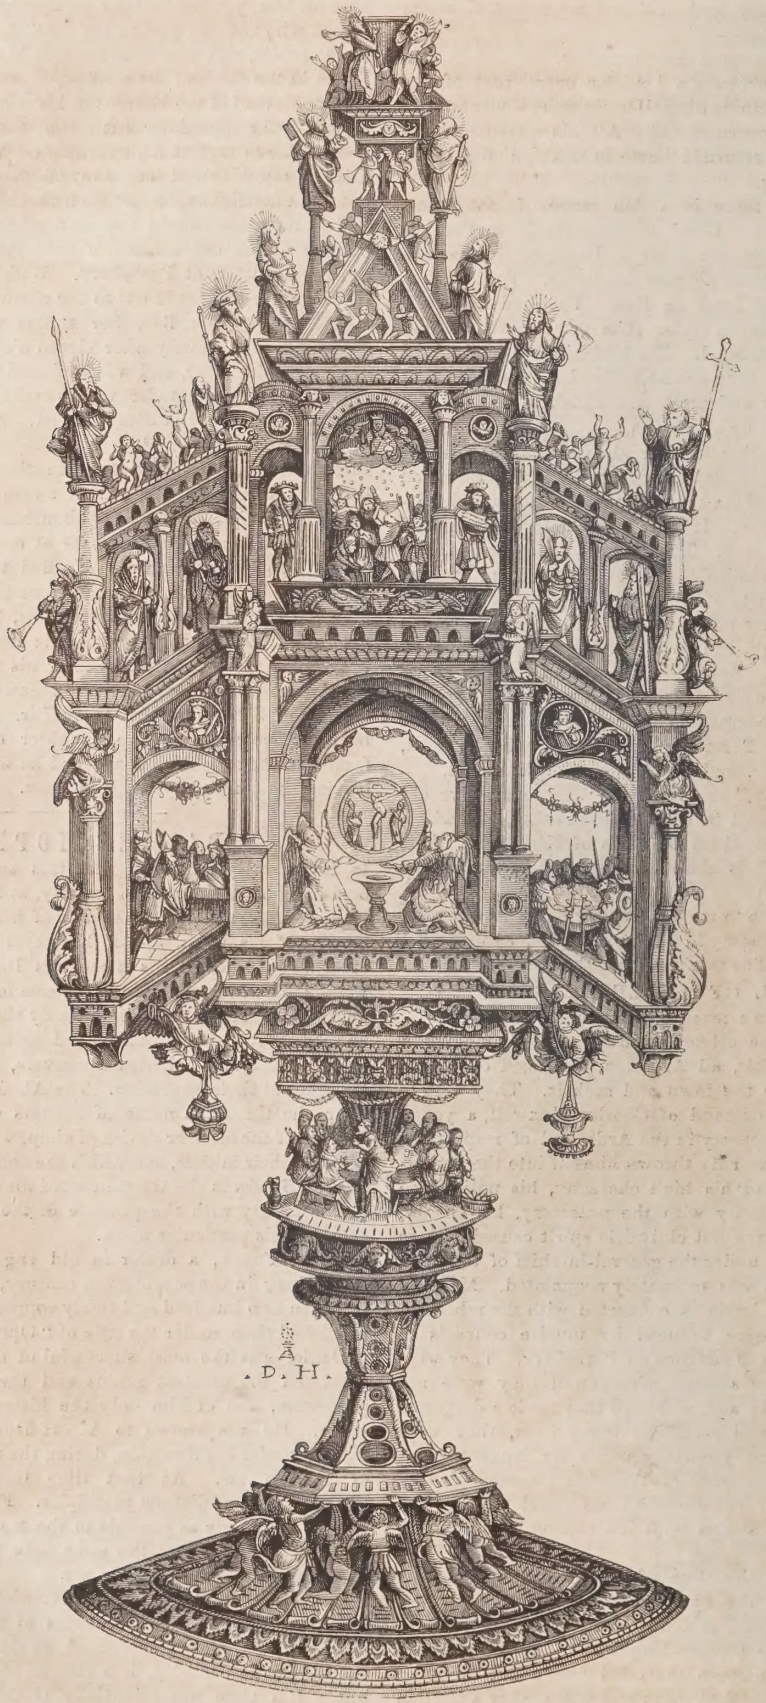
DANIEL HOPFER.

It is generally supposed that this artist was born at the beginning of the sixteenth century, at Nuremberg, the birthplace of Albert Durer. The date of his death is as uncertain as that of his birth, and it has never yet been satisfactorily ascertained whether his name was Daniel or David. Most writers, however, give the preference to the former, and from many circumstances it seems likely that they are right. He had two brothers, Jerome and Lambert, who, like himself, were skilful and talented engravers, and followed all the branches of their profession. The Abbé de Marolles bestowed upon the three the name of Masters of the Candlestick, on account of the mark or device of a hop, which was always placed between their initials, and which the abbé mistook for a candlestick. *Hopfen* is the German word for hop; and the Hopfers, in conformity with the practice of the day, adopted as their emblem this particular mark.

David Funck, a dealer in old engravings, who lived at Nuremberg in the seventeenth century, and who possessed no less than two hundred and thirty copperplates of these artists, published them under the title of "Opera Hopferiana."

Daniel was the most successful of the three brothers; he possessed the greatest genius and the greatest love for his profession, and of him only the history of art takes cognisance. He was known to Albert Durer, and for some time worked under his direction, during the most flourishing period of German art. At that time German engravers were governed by two distinct principles. First, they attempted to adhere as closely as possible to the teachings of their purely German school, but at the same time to unite with this the elevating influence of Italian art.

The merit of Daniel Hopfer consisted in uniting, in his own performances, the excellences of these two schools. To say that he perfectly succeeded would be erroneous; to say that he did so partially, is a statement which his works bear out. His taste was essentially Gothic; and many of his figures are incorrect. In ornamental work he was chiefly conspicuous. One of the most perfect and beautiful of his productions is, an engraving which represents our Saviour warning his apostles of false prophets, who are indicated by



SILVER VESSEL ENGRAVED BY SAMUEL HOPFER.

Pharisees and the ecclesiastics of the Roman Catholic Church: this seems clearly enough to show that Hopfer was a Lutheran. To sacred subjects he nearly always adhered; and they are remarkable for vigour and elegance.

SPANISH SCENERY.

For many years, one great obstacle to progress in Spain has been the non-existence of roads, rendering mules and muleteers indispensable. So severely is this defect, the consequence of bad government and internal dissensions, felt, that in certain districts wine, and good wine, is consumed on the spot at one-halfpenny per quart, for want of the means of conveyance. Mules can only carry small loads, especially when these loads are to be conveyed along the break-neck gullies so common in Spain. Muleteers, then, still exist; and perhaps they are the only Spaniards who still carry the guitar on their backs. The sentimental age of serenaders has passed away everywhere, except upon the stage and in the novels of certain modern publishers, who like revivals of the antique. Figaro and Almavira are mere fanciful portraits, which no more existed than Fra Diavolo or the Charles II. of Sir Walter Scott. The muleteer alone, who often follows the most difficult and solitary roads, who often wants amusement, has kept the habit of thrumming away at his old guitar. Half lying down upon his mule, as M. Giraud shows us in his sketch of the *Sierre Neveda*, whether climbing a hill or descending a slope, he sings his couplets as he moves—those *cantarillos*, which he generally improvises and addresses to his absent fair, or even to his mules.

A SKETCH OF THE SIERRE NEVEDA.—FROM A PAINTING BY M. EUGENE GIRAUD.

The accompanying picture by M. Giraud represents a well-known scene in the Sierre Neveda. A *mozo de mulas*, a kind of muleteer, leads the little caravan, or guides it by his songs.

The slope is so rapid, and the path so narrow—we cannot dignify it by the name of a road—that we are surprised and tremble almost to see what liberty the animals are allowed. The bridles hang on their necks; and yet the abyss is there—an abyss of some hundred yards in depth, into which the slightest false step would drive them. But in the land of high mountains it is so; the animal guides the man. The mules are so accustomed to these perilous roads, that they know far better how to place their feet than do their conductors. Besides, the mule is obstinate and self-willed. If you use the spur, it stops; if you stroke it, it lies down; if you pull the reins, it gallops off: it is better to leave it alone.

The saddle is generally composed of two or three variegated blankets doubled up, and sometimes of a well-stuffed cushion to disguise the sharp back of the brute. On each side, instead of stirrups, are pieces of wood to rest your feet on. The head of the animal is almost concealed by ornaments. The guide goes before on a mule, or accompanies that animal on foot, his guitar in his hands, his gun on his shoulder, and his powder-horn close at hand. Such a journey is exceedingly amusing.

PEERS AND M.P.'S.

PARLIAMENTARY ORATORS AND ORATORY.

The era of the Reformation was favourable to eloquence. It everywhere gave an impulse to the human mind and taught men to speak. Unfortunately, we have but the faintest records of that distant day. Erasmus, however, was a friend of More, and he has left his testimony to that great statesman's powers. Speaking of Sir Thomas More, Erasmus says:—"His eloquent tongue so well seconds his fertile invention, that no one speaks better when suddenly called forth. His attention never languishes; his mind is always before his words; his memory has all his stock so turned into ready money, that without hesitation or delay it gives out whatever the time and the case may require." When Pym led the house, the true tones of the orator were also heard. The speeches of the noble-hearted Eliot also do credit to his fame. Of one that has come down to us, no less a critic than Hazlitt says:—"There is no affectation of wit in it—no studied ornament—no display of fancied superiority; the speaker's whole heart and soul are in the subject—he is full of it—his mind seems, as it were, to surround and penetrate every part of it—nothing diverts him from his purpose, or interrupts the course of his reasoning." Some slight notion of the great Bacon's parliamentary success has been preserved by one of the most competent judges of that age:—"There happened in my time," says Ben Jonson, "one noble speaker, who was full of gravity in his speaking. His language, where he could spare or pass by a jest, was nobly censorious. No man ever spoke more neatly, more precisely, more weightily, or suffered less emptiness, less idleness, in what he uttered. No member of his speech but consisted of his own graces. His hearers could not cough or look aside from him without loss. He commanded where he spoke, and had his judges angry and pleased at his devotion. No man had their affections more in his power. The fear of every man who heard him was lest he should make an end." Still, however, much of this oratory was rough and rude, interspersed with more scriptural allusions and classical conceits than would suit the refined taste of the present age. Yet some fine things were said by the Eliots and Hampdens and Martens, whose names figure in the annals of those days.

Surely also we must not forget the orator whose maiden speech was of the flat Popery preached at St. Paul's Cross by Dr. Alabaster, and of whom Sir Philip Warwick wrote thus:—"I came one morning into the house well clad, and perceived a gentleman speaking (whom I knew not), very ordinarily apparelled, for it was a plain cloth suit which seemed to have been made by an ill country tailor; his linen was plain and not very clean, and I remember a speck or two of blood upon his little band, which was not much larger than his collar; his hat was without a hatband; his stature was of a good size; his sword stuck close to his side; his countenance swoln and reddish, his voice sharp and untunable, and his eloquence full of fervour." We need not add, that this man with the swoln and reddish countenance and the sharp and untunable voice, was Oliver Cromwell, who spoke to some purpose at a later day. In the next age, the plotting and restless Shaftesbury seems to have borne away the palm. But, after all, we have to pass a long period before we reach oratory in the highest acceptation of the term, which seems to have come to us from the accomplished and versatile St. John. Yet of his speeches we have no records whatever. All that we know is, that the bitter Dean of St. Patrick—who hated every body and every thing, and who cursed the day of his birth—speaks of him in the highest terms, speaks of him as producing oratorical effects unequalled in his times. We know that that opinion was the general opinion of the age. We know that the younger Pitt, when discussing with some friends as to what he would wish, supposing it possible to restore what was wished, said, while one remarked that he should prefer one of the lost orations of Demosthenes, and another wished for the lost books of Livy, another for a Latin tragedy, that, for his part, he should prefer a lost speech of Bolingbroke. With Bolingbroke the list of lost orations is closed. From his time we have records of the parliamentary debates, at first very obscure and very imperfect, but gradually becoming more copious and correct, till in our time reporting has arrived at such a pitch, that we have everything that can be given—all but the tone and figure, which, alas! no reporter can ever give.

First in our list, then, stands the well-known name of Walpole. He was the first prime minister who sat in the House of Commons, where for years he reigned supreme. Walpole, who took his seat for Castle Rising, excited by the fame his ancient rival Bolingbroke had acquired, was not long before he made his *debût* as a debater. The subject he spoke on is not known. "At the same time," says Coxe, "another member made a studied speech, which was much admired. At the end of the debate, some persons casting ridicule on Walpole as an indifferent speaker, and expressing their approbation of the maiden speech made by the other member, Arthur Mainwaring, who was present, observed in reply: 'You may applaud the one and ridicule the other as much as you please; but depend upon it, that the spruce gentleman who made the set speech never will improve, and that Walpole will, in time, make an excellent debater.'" The prophecy was correct. Walpole grew to be the greatest man in that house. That Walpole despised all affectation and all refinement, all the resources of the oratorical art beyond its great origin and fountain—strong sense, clear ideas, anxious devotion to the subject in view, carrying the audience along with the speaker—may well be supposed from the manly and plain, the homely and somewhat coarse character of his understanding. Eminently a man of business, he came down to parliament to do the business of the country; and he did it. He excelled in lucid statement, whether of an argument or of facts; he met his antagonist fearlessly, and went through every part of the question; he was abundantly ready at reply and retort; he constantly preserved his temper—was even goodnatured and gay in the midst of all his difficulties,—and possessed his constitutional good humour, with his unvaried presence of mind, in the thickest fire of the debate. He was a lively speaker, and was a constant favourite with the house, which it was his vocation to lead. We cannot judge of his speeches from the scanty records that have come down to us. This is especially true of that celebrated one which eventually drove Bolingbroke abroad. Some of his speeches remain distinguished by a highly ornamental and figurative manner, as where, in his speech on the Peerage Bill, he spoke of the ancients having erected the temple of honour behind the temple of virtue, to show by what avenues it must be approached; whereas, we were called upon to provide, that its only avenue should be, an obscure family pedigree, or the winding-sheet of some worthless ancestor. Some

idea of his more animated efforts may be formed from the admirable exordium of his speech in reply to Sandys:—"Whatever is the conduct of England, I am equally arraigned. If we maintain ourselves in peace, and seek no share in foreign transactions, we are reproached with tameness and pusillanimity. If we interfere in disputes, we are called Don Quixotes, and dupes of all the world. If we give guarantees, it is asked why the nation is wantonly burdened. If guarantees are declined, we are reproached with having no allies."

The Opposition had some powerful men in it. Pulteney, Windham, Shippen, Sandys, were all men of weight; but not orators in the highest acceptation of this term.

A greater man than Walpole was, however, to appear upon the stage. "We must muzzle that terrible cornet of horse," said Walpole, when for the first time the tones of the elder Pitt rang through the house. That terrible cornet was not, however, to be muzzled at that time. His figure, when he first appeared in parliament, was strikingly graceful and commanding, his features high and noble, his eye full of fire. His voice, even when it sank to a whisper, was heard to the remotest benches; and when he strained it to its full extent, the sound rose like the swell of an organ of a great cathedral, shook the house with its peal, and was heard through lobbies and down staircases to the Court of Requests and the precincts of Westminster Hall. He cultivated all these eminent advantages with the most assiduous care. His action is described by a very malignant observer as equal to that of Garrick. His play of countenance was wonderful; he frequently disconcerted a hostile orator by a single glance of indignation or scorn. Every tone—from the impassioned cry to the thrilling aside—was perfectly at his command. His power was boundless. It is related that once, in the House of Commons, he began a speech with these words, "Sugar, Mr. Speaker," and then observing a smile to pervade the audience, he smiled, looked fiercely round, and in a loud and angry voice pronounced the word "sugar" again, three times; and having thus subdued the house, he turned round and disdainfully asked, "Who will laugh at sugar now?" He was the father of long speeches. Lord Brougham says: "He was anything rather than a concise or short speaker—he was prolix in the whole texture of his discourse, and he was certainly the first who introduced into our senate the practice adopted in the American war by Burke, and continued by others, of long speeches—speeches of two and three hours, by which oratory has gained little and business less." Unlike Demosthenes—of whom Plutarch tells us, that he would never speak off-hand, however often called up in public assemblies—Lord Chatham was essentially an off-hand speaker. Whenever he prepared a speech it was a complete failure. "No man," says a critic, who had often heard him, "ever knew so little what he was going to say." Yet his *hits* were most felicitous. Lord Brougham has preserved several of them. We give a few. His remark during the debate on confidence in ministers, in 1706, is well known. He said their characters were fair enough, and he was always glad to see such persons engaged in the public service; but turning to them with a smile, very courteous but not very respectful, he said:—"Confide in you? Oh, no—you must pardon me, gentlemen—*youth* is the season of incredulity—confidence is a plant of slow growth in an aged bosom." Some one having spoken of the obstinacy of America, and said that she was almost in open rebellion, Mr. Pitt exclaimed: "I rejoice that America has resisted. Three millions of people, so dead to all the feelings of liberty as voluntarily to let themselves be made slaves, would have been fit instruments to make slaves of all the rest." His indignant and contemptuous answer to the ministers' boast of driving the Americans before the army—"I might just as well think of driving them before me with this crutch"—is well known. Perhaps the most celebrated passage of his speeches is his allusion to the maxim of English law, that every man's house is his castle:—"The honest man may in his cottage bid defiance to all the forces of the crown. It may be frail—its roof may shake—the wind may blow through it—the storm may enter—the rain may enter—but the king of England cannot enter!—all his force dare not cross the threshold of the ruined tenement."

Next in position to the elder Pitt is Charles James Fox. Fox, said old Sam Johnson, "is a most extraordinary man: here is a man"—describing him in terms which Boswell was afraid to give—"who has divided the kingdom with Cæsar; so that it was a doubt whether the nation should be ruled by the sceptre of George III. or the tongue of Fox." Gibbon says Fox discovered powers for regular debate which neither his friends hoped nor his enemies dreaded. His force as a professed orator was conspicuously displayed in Westminster Hall on the trial of Warren Hastings; but the triumph of his talents is to be found in those masterly replies to his antagonists, in which cutting sarcasm, logical acuteness, and metaphysical subtility, were so combined as to surpass all that modern experience had witnessed. Johnson was his bitter foe, and yet Johnson was compelled to speak of him in terms we have quoted. We next give the testimony of a friend: "Fox as an orator," said Godwin, "seemed to come immediately from the forming hand of nature. His eloquence was as impetuous as the current of the river Rhine. Nothing could arrest its course. Though on all great occasions he was throughout energetic, yet it was by sudden flashes and emanations that he electrified the heart and shot through the blood of his hearers. I have seen his countenance brighten up with more than mortal ardour and goodness. I have been present when his voice has been suffocated with the sudden bursting forth of a flood of tears." The following anecdote will set the intuitive quickness of Mr. Fox's parts in a strong light. On the day of the debate on the Test and Corporation acts, Dr. Rees waited on Mr. Fox, with a deputation, to engage his support in their cause. He received them courteously, but though a friend to religious liberty, was evidently unacquainted with the strong points and principal bearings of their peculiar case. He listened attentively to their exposition, and with an eye that looked them *through and through*, put four or five searching questions. They withdrew after a short conference, and as they walked up St. James's-street, Mr. Fox passed them booted, as if going to take air and exercise. From the gallery they saw him enter the house with whip in hand, as if just dismounted. When he rose to speak, he displayed such a mastery of his subject, his arguments and illustrations were so various, his views so profound and statesman-like, that a stranger must have imagined the question at issue, between the high church party and the dissenters, to have been the main subject of his study. Fox's test of a speech was, "Does it read well?" If so, it was a bad speech. Unfortunately, this is the case; and, unfortunately, no man suffered in this respect more than Fox himself. We have his speeches to read; they seem to us, comparatively speaking, poor. We are not fascinated with them as we are with those of Burke. We miss all that made those speeches a terror to his foes, when they were delivered in a crowded and admiring house. To speak of him justly as an orator, says Sir James Mackintosh, would require a long essay. Everywhere natural, he carried into public something of that simple and negligent exterior which belonged to him in private. When he began to speak, a common observer might have thought him awkward; and even a consummate judge could only have been struck with the exquisite justness of his ideas and the transparent simplicity of his manners. But no sooner had he spoken for some time, than he was changed into another being. He forgot himself and everything around him. He thought only of his subject. His genius warmed and kindled as he went on. He darted fire into his audience. Torrents of impetuous and irresistible eloquence swept along their feelings and convictions. He certainly possessed above all moderns that union of reason, simplicity, and vehemence, which formed the prince of orators. He was the most Demosthenian speaker since the days of Demosthenes. "I knew him," says Mr. Burke, in a pamphlet, written after their unhappy difference, "when he was nineteen; since which time he has risen by slow degrees to be the most brilliant and accomplished debater the world ever saw."

JAPAN AND THE JAPANESE.

It is a treat for the Dutch to go into Nagasaki, though they are always so encumbered with police and guards as to be able to see scarcely anything. And yet it is a change, and one gladly embraced by men so secluded and solitary. They wander through the town, they banquet in the temple, and visit the tea-houses. They at all events by these journeys enable us to indulge our curiosity relative to the town.

Nagasaki is on a hill side, regularly built, with pleasing gardens to all the houses, which are low, with one story and a loft. The height of the houses is determined by law, and they

A kind of hut contains all the valuables not in immediate use, the stock of a tradesman, his books, pictures, etc. These warehouses are built in the same way as the houses are, but are coated with clay, and have copper shutters, while a large kettle full of mud is ready to coat the sides with in case of accident. Fires are very common, and in several fearful conflagrations these store-rooms escaped entirely without injury.

Beyond the town the scenery is beautiful, hill and dale, sea and land, lending their several charms. The people appear

THE ROAD TO YEDO, JAPAN.

are constructed of wood and mud, with chopped straw. This has a coat of hard cement over it. The windows have paper in the place of glass, with wooden shutters. There are also Venetian blinds. A portico stands out in the front of large houses, where umbrellas, shoes, and even palanquins are deposited, as mud boots are left in Constantinople. The back of the house projects in a triangular form into the garden, to ensure light and air. The view into these long gardens is pleasing, and even curious, from the effort in such a small space to make rocks, mountains, waterfalls, trees, etc., with a little family chapel.

thoroughly to appreciate this, as may be seen from their selecting the most beautiful sites for their temples. As the Turks revel often in cemeteries, so do the Japanese in certain halls of their temples, where banqueting goes on to an extent which is sometimes very disgraceful.

There are, however, tea-houses, which are licensed for drinking and music, and are the scenes of orgies even more disgraceful than those which take place in the temple gardens. Here it is that the learned Japanese Aspasias hold their courts. In Nagasaki, a town of 750 inhabitants, there are 750 tea-houses.

Religious ceremonies sometimes diversify the scene. That on the festival of the god Sawa, the patron of the town, is the most curious. It lasts several days. His temple is adorned with flags; the people are in their holiday clothes; the altar is gorgeous. A procession is a very noisy affair, but at the same time absurd; and the whole thing is, like the

JAPANESE ARCHERS.

JAPANESE ARCHERS.

civilisation of the country, in striking contrast with Christianity, and it may here be remarked, that there is really *no* civilisation

extant now, except in Christian countries. A hunting procession is something equally ludicrous and novel.

A volcanic eruption occasionally diversifies the monotony of life led by the factors. These and the earthquakes explain the character of the houses. Siebold gives the following description of a scene of terror and desolation:—At five o'clock on the afternoon of the 18th of the first month, the summit of the Wunzen suddenly sank, and smoke and vapour burst forth. On the 6th of the following month, an eruption occurred in the Brivonokubi mountain, situate on its eastern declivity, not far from the summit. On the 2nd of the third month, a violent earthquake, felt all over Kiusiu, so shook Simabara, that no one could keep his feet. Terror and confusion reigned. Shock followed shock, and the volcano incessantly vomited stones, ashes, and lava, that desolated the country for miles around. At noon on the 1st of the fourth month, another earthquake occurred, followed by reiterated shocks, more and more violent. Houses were overthrown, and enormous masses of rock, rolling down from the mountain, crushed whatever lay in their way. When all seemed quiet and the danger was believed to be over, sounds like the roar of artillery were heard in the air and underground, followed by a sudden eruption of the Myokenyama, on the northern slope of the Wunzendake. A large part of this mountain was thrown up into the air; immense masses of rock fell into the sea; and boiling water, bursting through the crevices of the exploded mountain, poured down, overflowing the low shore. The meeting of the two waters produced a phenomenon that increased the general terror. The whirling eddies formed waterspouts, that annihilated all they passed over. The devastation wrought in the peninsula of Simabara and the opposite coast of Figo, by these united earthquakes and eruptions of the Wunzendake, with its collateral craters, is said to be indescribable. In the town of Simabara every building was thrown down except the castle, the cyclopean walls of which, formed of colossal blocks of stone, defied the general destruction. The coast of Figo was so altered by the ravages, as to be no longer recognisable. Fifty-three thousand human beings are said to have perished."

The journey to Yedo to visit the *ziogoon*, or military chief of the empire, is a duty similar in character to that of the pilgrimage to Mecca. It was allowed to the president of the factory by Gongen-Sama, the usurper, as were many other privileges, which the Dutch lost by asking for them to be renewed. They were not aware that to ask the son's consent to a renewal was an insult, as a thing given once was given permanently.

The journey is the more tedious, that beds, provisions, etc., have all to be taken, while the retinue of the Dutchman is at least two hundred. He travels in a palanquin of the first class, and is in fact treated in all things like a native prince. It takes seven days to cross Kiusiu; then comes a short sea voyage, sometimes twice as long as the first part, the travellers always putting up at an island for the night. The whole time from Dezima to Yedo is seven weeks, which gives a very quiet idea of Japanese travelling. The roads are in good condition, the accommodation on the journey ample, while there are some sights well worthy of being seen.

Siebold appears in the first instance to have been struck by a Buddhist temple of the Ikko-sen sect, at Yagami, where the party dined the day they left Nagasaki. "It presented," we are told, "a rare instance of a Buddhist temple, that may be called exempt from idols, containing only a single image, designed to represent the one only god, Amida. The bonzes of this sect are the only Buddhist priests in Japan allowed to marry and to eat meat." Their faith, Siebold considers to be pure monotheism.

Another curiosity is a camphor-tree, spoken of by Kaempfer, in the year 1691. It was then celebrated for its size, hollow from age, and supposed to measure six fathoms in circumference, though from its standing on a hill it was not then actually measured. It was visited by Siebold in 1826. He found it still healthy and rich in foliage, though 135 years older. He and his pupils measured it, and he gives fifty feet as its circumference, adding, that fifteen men can stand in its inside.

A coal mine was one of the most curious of all the objects seen. It was admirably worked and very productive; so that, when opened to commerce, this country will have the means of supporting steam navigation. A river full of gold-dust, and a mountain covered by snow having been passed, the route became more varied. Soon after leaving Foesi, the Dutch deputation begins the toilsome ascent of another mountain or ridge, which must be crossed. It is called Fakone, and is said likewise to offer splendid views of mingled fertility and savage nature. At a spot presenting the most admired of these, an establishment is prepared for the reception of travelling grandees, where tea, confectionary, and other dainties are served up by beautiful damsels. Upon this mountain a second guard is stationed, for the prevention of unlawful ingress and egress into and out of Yedo; and a curious anecdote is told of a trick put upon this Fakone guard, and of the combined artifice and violence by which the extensively fearful consequences of that trick were obviated.

"An inhabitant of Yedo, named Fiyosayemon, a widower with two children, a girl and a boy, was called to a distance by business. He was poor; he knew not how to provide for his children during his absence, and resolved to take both with him. Accordingly, he dressed his daughter in boy's clothes, and thus passed the Fakone guard unsuspected. He was rejoicing in his success, when a man, who knew what children he had, joined him, congratulated him on his good luck, and asked for something to drink. The alarmed father offered a trifle; the man demanded a sum beyond his means; a quarrel ensued, and the angry informer ran back to the guard to make known the error that had been committed. The whole guard was thunderstruck. If the informer spoke truth, and the fact were detected, all their lives were forfeited; yet to send a party to apprehend the offenders, and thus actually betray themselves, was now unavoidable. The commanding officer, however, saw his remedy. He delayed the detachment of reluctant pursuers sufficiently to allow a messenger with a little boy to outstrip them. The messenger found Fiyosayemon and his children refreshing themselves at an inn; he announced the discovery made, and the imminent danger; offered the boy as a temporary substitute for the disguised girl, and told the father that when the falsehood of the charge should have been proved by both the children appearing to be boys, he might very fairly fly into such a rage as to kill his accuser. The kind offer was, of course, gratefully accepted. The wilfully dilatory guard arrived, surrounded the house, seized upon Fiyosayemon and the children, and gladly pronounced that both the latter were boys. The informer, who well knew Fiyosayemon's family, declared that some imposition had been practised, which the accused indignantly resenting, drew his sword and struck off the informer's head. The delighted guard exclaimed, that such a liar had only met his desert, and returned to their post; while the father, receiving back his daughter instead of the substituted boy, went his way rejoicing." *

The approach to Yedo is represented in our engraving (p. 428). We have also given some representations of archery as practised in Japan (p. 429).

The town of Yedo is paved with stone, with regular-built houses, shops, vast crowds, touters at the doors crying out the goods, and very much reminding one of London in its activity and bustle. It is an immense place, with, some say, 500,000, others 800,000 of inhabitants. The imperial palace takes three hours to walk round it. It is a vast town in a town, with harems, houses for functionaries and servants of all kinds, and is surrounded by a ditch. No one can give much account of the town, because of the strict seclusion in which all travellers are kept. The visit to the ziogoon appears to be a very tedious ceremony.

* Titsingh's "Japanese Annals."

ROUND COUVERETTE FOR AN EASY CHAIR OR SOFA.

"Let your" thread "be long, and your" hook "be fine,
And your hands both firm and sure;
And time, nor chance, shall your work untwine,
But all, like a truth, endure."

MATERIALS.—Brooks's Great Prize Goat's-head Crochet Cotton, No. 24. No. 3 Penelope Hook.

1st round: 9 ch., unite; 3 ch., this forms 1 l. stitch; under this circle work 24 l., that is, including the 3 ch., which reckon as "1 l.;" in fastening off this round, simply insert the hook through the 3rd loop of the 3 ch., draw the cotton through, cut it off, draw it down at the back, and tie it in a neat and secure knot.

2nd: Be careful not to begin in any row in the same place where the previous row was terminated. 2 l. into every loop of last row; there should be 48 l.

3rd: 1 l. into every loop, with 1 ch. between each.

4th and 5th: 1 l. upon every l., with 2 ch. between each.

6th: Commence upon a l. stitch, * 2 l. into 1 loop, 5 ch., miss 2 loops, repeat from * 3 times more, then 3 ch., miss 2 loops, 10 l., 3 ch., miss 2 loops, repeat.

7th: *2 l. into the 3rd loop of the 5 ch.; 5 ch., repeat from * twice more, then 10 l. on l., repeat.

8th: 3 d.c. stitches, the 1st into the 2nd loop of the 5 ch., after the l. stitches, 5 ch., repeat from * 3 times more, 12 l. the 1st into next loop, repeat.

9th: *3 d.c. the 1st into the 2nd loop of the 1st 5 ch., 5 ch., repeat from * twice more, miss 1 loop, 18 l. the 1st in 2nd loop.

10th: D.c. into the centre loop of the 5 ch., 5 ch., d.c. into centre loop of next 5, 3 ch., 24 l. the 1st on next d.c. stitch, 3 ch., repeat.

11th: 3 d.c. the 1st into 2nd loop of 5 ch., 3 ch., 1 l. on every l., with 1 ch. between each, 3 ch., repeat.

12th: 1 l. on l., 1 ch, repeat over the l. stitches, then 3 ch., 3 d.c. on the 3 d.c., 3 ch., repeat.

13th: 1 l. on l., 1 ch., repeat this over the l. stitches, 7 ch., repeat.

14th: The same.

15th: 1 l., 2 ch. over the l. stitches, then 3 ch., 1 l. into 3rd loop of the 7 ch., 5 ch., miss 1 loop, 1 l. into next loop, 3 ch., repeat.

16th: 7 sq., 6 l., 14 sq., 3 ch., d.c. into centre loop of 5 ch., 3 ch., repeat.

17th: 6 sq., 12 l., 13 sq., 3 ch., 1 l. on d.c. stitch, 3 ch., repeat.

18th: 6 sq., 12 l., 4 sq., 9 l., 2 sq., 3 l., 3 sq., 3 ch., d.c. on d.c., 3 ch., repeat.

19th: 6 sq., 12 l., 3 sq., 12 l., 2 sq., 3 l., 3 sq., 3 ch., d.c. on d.c., 3 ch., repeat.

20th: 6 sq., 6 l., 1 sq., 3 l., 2 sq., 15 l., 1 sq., 3 l., 4 sq., 3 ch., d.c. on d.c., 3 ch., repeat.

21st: 6 sq., 6 l., 1 sq., 3 l., 1 sq., 6 l., 1 sq., 6 l., 1 sq., 3 l., 5 sq., 3 ch., d.c. into centre loop of 1st 3 ch., 3 ch., d.c. into centre loop of next 3 ch., repeat.

22nd: 3 sq., 6 l., 1 sq., 12 l., 1 sq., 3 l., 1 sq., 6 l., 8 sq., 5 ch., 1 l. into centre loop of centre 3 ch, 5 ch., repeat.

23rd: 2 sq., 12 l., 1 sq., 3 l., 2 sq., 12 l., 9 sq., 5 ch., d.c. into centre loop of 1st 5 ch., 5 ch., d.c. into centre loop of 2nd 5 ch., 5 ch., repeat.

24th: 2 sq., 3 l., 2 sq., 6 l., 1 sq., 6 l., 1 sq., 6 l., 10 sq., 7 l., d.c. into centre loop of 2nd 5 ch., 7 ch., repeat.

25th: 3 sq., 9 l., 1 sq., 12 l., 1 sq., 15 l., 6 sq., 5 ch., d.c. into centre loop of 7 ch., 5 ch., d.c. into centre loop of 7, 5 ch., repeat.

26th: 7 sq., 12 l., 1 sq., 3 l., 2 sq., 9 l., 5 sq., 5 ch., d.c. into centre loop of 5, 3 ch., 5 l., with 1 ch. between each, under the next 5 ch., 3 ch., d.c. into centre loop of 5, 5 ch., repeat.

27th: 3 sq., 12 l., 1 sq., 6 l., 1 sq., 21 l., 1 sq., 3 l., 3 sq., 5 ch., d.c. into centre ch. of 5, 3 ch., 11 l. the 1st into 3rd loop of 3 ch., 3 ch., d.c. into 5, 5 ch., repeat.

28th: 2 sq., 9 l., 1 sq., 6 l., 2 sq., 6 l., 1 sq., 12 l., 3 sq., 3 l., 2 sq., 5 ch., d.c. into centre of 5, 3 ch., 13 l., the 1st into 3rd loop of 3 ch., 3 ch., d.c. into centre of 5, 5 ch., repeat.

29th: 2 sq., 6 l., 1 sq., 24 l., 7 sq., 3 l., 2 sq., 5 ch., d.c. into centre loop of 5 ch., 3 ch., 15 l., the 1st into 3rd loop of 3 ch., 3 ch., d.c. into centre loop of 5, 5 ch., repeat.

30th: 2 sq., 15 l., 1 sq., 6 l., 1 sq., 6 l., 1 sq., 3 l., 3 sq., 6 l., 3 sq., 5 ch., d.c. into centre loop of 5, 3 ch., 8 l., the 1st into the 3rd loop of the 3 ch., 1 ch., miss 1 loop, 8 l., 3 ch., d.c. into centre of 5 ch., 5 ch., repeat.

31st: 2 sq., 12 l., 3 sq., 6 l., 1 sq., 6 l., 1 sq., 9 l., 5 sq., 5 ch., d.c. into centre loop of 5, 3 ch., 8 l., 3 ch., d.c. into centre loop of 3 ch., 3 ch., 8 l., the 1st or 2nd d.c., 3 ch., d.c. into centre loop of 5, 5 ch., repeat.

32nd: 3 sq., 6 l., 4 sq., 15 l., 1 sq., 3 l., 7 sq., 5 ch., d.c. into centre loop of 5, 3 ch., 9 l., the 1st into 3rd loop of the 3 ch., 3 ch., d.c. on d.c., 5 ch., d.c. into same loop, 3 ch., 9 l., the 1st on next l., 3 ch., d.c. into centre loop of 5, 5 ch., repeat.

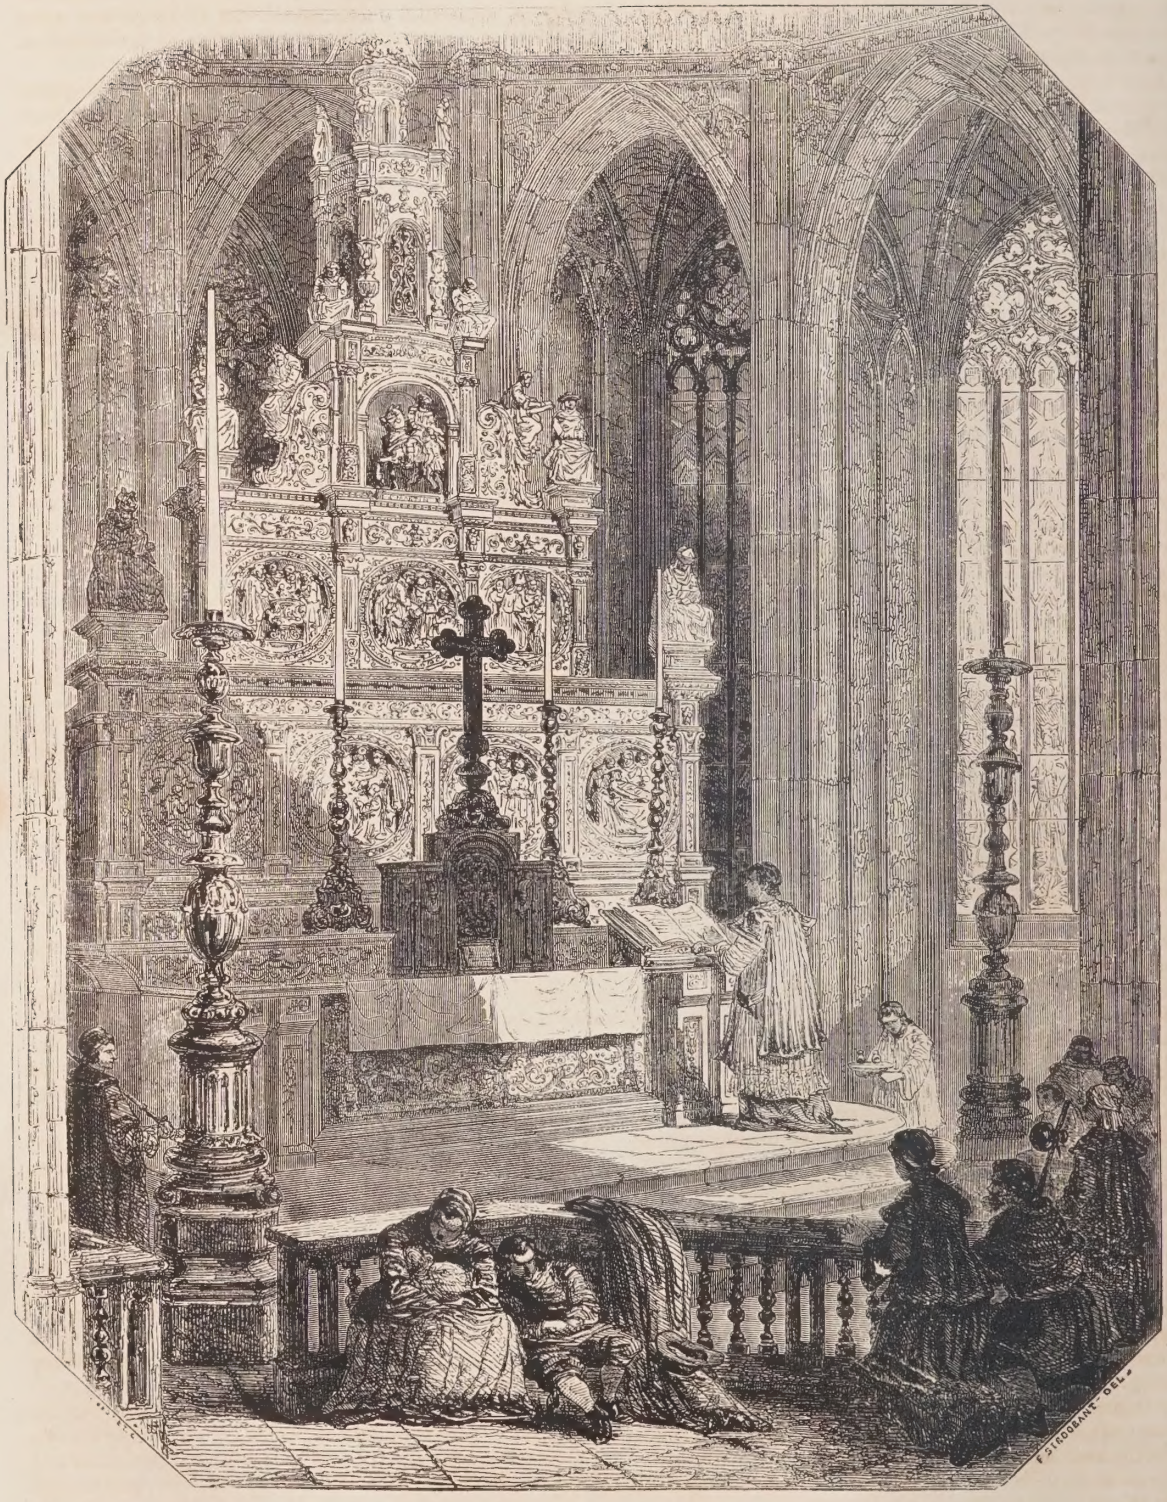
66th: A row of long stitches all round.

Fringe.—D.c. into a loop, make * 70 ch., rather loosely, miss loop of last round, d.c. into next loop, repeat from *.



HIGH ALTAR IN THE CHURCH OF NOTRE DAME, AT HALLE, BELGIUM.

HIGH ALTAR AT NOTRE-DAME, AT HALLE, IN BELGIUM.

How little it often requires to render a thing famous, and to cause a name to roll from mouth to mouth, and thus earn universal reputation! Such is the case with the little town of Halle, in South Brabant. Though the extent of this town is too limited, its population too small, its productions too insignificant, and its historical traditions too uninteresting to insure its name a place in a schoolboy's geography, it nevertheless attracts the attention of the world, causes the artist to turn out of his road to visit it, saves the engraver's etching point many an idle day, and adds to the graceful and elegant appearance of our magazines and of our albums. And why? Because artistic genius has worked out its inspirations, and left its trace behind it; because the architect, the sculptor, and the painter, have all been there to show the world, in the legacy they have left it—a cathedral—to what a height their different arts can arise.

From what we have just said, it may be concluded that Halle owes all its celebrity to its Cathedral. Seen from a distance, however, this structure, which was begun in 1341 and terminated in 1409, appears in no way imposing from the size of its proportions; and its exterior has nothing remarkable about it, with the exception of a tower, which is square as far up as two-thirds of its height, and then becomes octangular, the whole being covered with reliefs and embrasures. The architecture of the interior is most elegant, while the decorations are profusely elaborate. The vaulted roof of the nave, which is divided into three parts, is supported by pillars, the verves of which are gracefully arranged in clusters. The choir presents the most splendid appearance: bright coloured windows, open-worked niches, statues, statuettes, and a thousand other ornaments of various kinds, there meet the eye and produce the most wonderful effect. But the part that crowns all is the High Altar, which is a perfect *chef-d'œuvre*, its general arrangement being full of grandeur, while the details are executed in the most minute and delicate manner. In the upper part of it is seen an image of St. Martin, under whose protection the church was placed at the time of its foundation. At the end of the fourteenth century, however, the name was changed to that of Notre-Dame, in consequence of certain events, which we will now briefly relate. The Countess Alix, wife of Jean d'Avesnes, had presented one of the chapels of the church with a little statue which she had inherited from St. Elizabeth of Hungary. This statue, which was an image of the Virgin, had, it was said, already worked a great number of miracles. The faithful rushed in crowds to offer up their devotions to it, and, as the miracles continued, the fame of the statue became so great, that people began to designate the church by the name of the Virgin only, until it was finally placed under her protection.

While viewing this part of the church, the mind is lost in wonder at the immense amount of patience which must have been expended on the intricate details, on the tracery, on the open work, and on the sculpture executed there. The whole, which is as imposing a work as the hand of man will ever perfect, is made up of parts, each of which is a masterpiece in itself, that fascinate the eye and engrave the name of Halle on the memory of all who visit its cathedral.

Nearly all Catholic churches possess a treasure: that of Notre-Dame at Halle is perhaps the richest that exists in Belgium. It is placed under the protection of the first magistrate of the town, and it would be almost impossible to describe the jewels of all forms and materials of which it is composed. In the chapel of Notre-Dame is seen a splendid collection of crosses, lamps, coats of mail, standards, mouxtrances, chalices, and gold, silver, and ivory figures—all presents from kings and princes of every country. One of the most magnificent objects contained in this treasure is a silver-gilt mouxtrance presented by Henry VIII., king of England, a little time before he seceded from the church of Rome.

The miraculous statue is carried in a solemn procession which takes place once a year, on the first Sunday in September, the day of the *kermesse*, by twelve delegates from the neighbouring towns which were the first to place themselves under its protection. The inhabitants of Liege also come once a year in a procession to pay a visit to the church at Halle.

In one of the side chapels may be seen a Latin inscription, in which it is stated that Gustus Lipse, the author of a book written in honour of the Virgin of Halle, bequeathed his pen to Notre-Dame.

THE REBEL OF AUDLEY CASTLE.

A TALE OF THE IRISH REBELLION OF '98.

II.

THROUGH Moore's instrumentality the young lady got intimation of her lover's place of concealment, and visited him frequently. Upwards of a week elapsed, when one evening Moore, who had been away from early morning, reached the castle.

"Well, Andy, what's the news of the lugger?" Maxwell inquired. "Is she soon to be on the coast?"

"I was tould to tell you that she'll be in with to-morrow night's tide. She'll keep outside the bar, but her boat will be at the shore where you directed from eleven o'clock. We must part, captain, dear; but poor Andy will mind you when far away."

"God bless you, Andy! You've stood to me like a brother. If I get off and prosper, Andy, you won't want."

"Andy won't want," said the faithful fellow. "Andy never fears he'll want. The crows are fed, and so will Andy be fed; and they get their nests, and Andy won't want a bed."

"God grant it!" replied Maxwell. "Now, Andy, will you slip away when you've eaten something, and see Miss Alice? Tell her just what you have told me about my starting. Ask her to try and see me to-night. You can steal out and accompany her. But be on your guard. Don't let the servants suspect you come from this quarter; and if Miss Alice's cousin (the Spy) is in the house when you go, keep your eye on him, and don't let him see you speaking to her. Let them all think you're just looking your *bit* and *sup*."

The faithful creature reached the house to which he was sent, as a strolling beggar. He sat down by the fire, and his supper was soon put before him. The person he had been warned about—Alice's cousin—was in the house. He lived only a few fields distant. He was a tall, well-featured young man; but he had acquired dissipated habits, and was of a most violent disposition. His passions were altogether unbridled, and so that he could succeed in accomplishing his purposes, he cared not what means he employed. From his childhood he had exhibited two dark traits of character, which in manhood were fearfully prominent—namely, intense hatred to any who ventured to thwart his purposes, and extraordinary perseverance in seeking to do them injury. He was dreaded by all who knew his character. George Macoubrey—such was his name—had early resolved that Alice should be his wife, and he had all along everywhere made known his intention. He was constantly following after her; and on this account, as well as from his statements, it was generally supposed that they would be married.

Many wondered at her choice, and commiserated her lot, should she be united to a person so likely to make her life one of great wretchedness. The truth is, however, that Alice had always repulsed the attentions of her cousin. She had become deeply, although secretly, attached to Charles Maxwell, who was therefore an object of her cousin Macoubrey's most dire hate.

Macoubrey had long suspected that there was an attachment between Alice and Maxwell, and he had spoken to her on the subject, uttering the most fearful threats against his rival, should he dare, as he said, "to come between him and the girl that *must* be his wife." It was Macoubrey who had watched Maxwell at Ballynahinch, followed him in his flight, and then given secret information against him to Captain Hopkins in the manner already noticed.

Just before Andy Moore reached Alice's father's house, she had been asked by Macoubrey to speak with her in the garden. He seemed greatly excited when making the request. When they reached the garden, Macoubrey said:

"Alice, I want to ask you once more, will you consent to be my wife? I love you, and you know it, wildly. You'll be always near the old people; and I swear this night by—"

"Stop, George," said Alice, interrupting him; "don't swear. How often have I told you that I cannot do what you ask! From my heart I wish you well. But indeed I cannot consent to be your wife. Now don't be angry; don't be so excited."

"Excited!" exclaimed Macoubrey; "you drive me mad, Alice. Why won't you marry me? Have I not loved you always? Have I not always said you must be my wife? But I know why you won't be mine; you love Maxwell. Tell me, Alice—tell me, has he won your love?"

"George," said Alice, "I have no right to answer your questions. But I may now tell you the truth. Charles Maxwell you will probably not see again. You cannot now injure him. He loved his country; he has courageously fought for it; and now he is driven from its shores. He loved me, too, dearly, passionately. And, George, I may now tell you, I do love him—love him as I have never loved, and never can love another."

"Then the skulking vagabond shall die, Alice," cried Macoubrey, frantic with passion. "He shall die. He escaped at Morne; but he shall not escape me. I'll ferret him out. Nor will I have to hunt long or far. Ha! you tremble. If he's not here, yet he'll soon be about the neighbourhood. I'll watch him and his scouts."

Alice fled into the house. She had indeed trembled with terror while listening to her cousin's threats. At first she thought Maxwell's hiding-place was known to him. She was relieved a little, however, when she learnt from his latter statement that in this supposition she was mistaken. It was clear he did not know where Maxwell was. Still she was greatly excited and alarmed lest he should at once begin the search for his intended victim, and perhaps discover him before he had been warned to fly. She determined that night to give him warning. Shortly after she went into the house her cousin followed, and he had only entered when Andy Moore arrived.

"Where do you come from?" he inquired sharply, as Andy sat down by the fire.

"'Deed, sir, I'm just come from Down, where the folks are aye guid and kind to me."

"But where do you live?" said Macoubrey.

"Where do I *lieve?* 'Deed I'm like the swallows. I have no settled place, but wander about in all parts. It's lang since I could say any house was my hame."

Macoubrey ceased to interrogate Andy further. When he left the house, Alice seized on an opportunity of hearing from Andy his message. She then arranged to accompany him to Audley Castle when the family had all gone to rest and her absence would not be observed by the domestics.

We have said that Alice was a beautiful girl. She was also remarkable for a lovely disposition, characterised by great gentleness blended with resolute firmness. She was the eldest member of her family, and beloved by them all. Her parents were aware of her attachment to Charles Maxwell; and, from his high moral character, they were not opposed to it. Even his close and prominent connexion with the united Irishmen did not lead them to alter their opinion on this point, inasmuch as they, in common with many around them, strongly favoured the movement of the intended revolutionists. They deeply mourned the results of the fatal battle of Ballynahinch, and shared with their sadly-afflicted daughter in her intense anxiety about the safety of her lover. They learnt from Alice his arrival at Audley Castle, and were aware of her meeting with him there.

Alice, accompanied by Andy Moore (who had previously reconnoitered, to guard against any observing their movements), proceeded to the castle. It was a dark night, and they were obliged to move along but slowly and cautiously. Maxwell met them near the ruins.

"God bless you, dear Alice, for coming!" he exclaimed, speaking with deep emotion. "This is likely to be our last meeting. Andy has told you that I must be across the bar to-morrow night. The lugger makes direct for the French coast. Oh! how am I to part from you? My heart is crushed when I think of being separated from you—perhaps for ever."

Maxwell's feelings overcame him. The strong man, who had fought like a lion in the midst of death, was totally unarmed, and he wept passionately. Alice, too, was overwhelmed with sorrow, as she clung to him for support.

"But you'll often think of me," he continued, as he recovered somewhat from his emotion. "You'll remember that, wherever I am, till this poor heart of mine is cold in death, I am your own."

Alice had as yet only spoken a few broken sentences. An idea that had much occupied and distracted her mind since Maxwell's flight, now engrossed her thoughts. As he ended speaking, she said:

"Charles, we won't be parted. I will accompany you, if my parents do not object. Come with me this moment to the house. If they consent, the minister can come over from Portaferry, and marry us to-morrow night. I feel I cannot remain behind you."

It is needless to attempt to describe Charles Maxwell's joy as he listened to the heroic resolution of the noble girl. They had a long interview with her father and mother; at length they consented to the proposal of Alice, to be united to Maxwell and be the companion of his exile.

"God bless you both!" said the father. "It's hard to let you go from us, darling," addressing fondly Alice, "but it would be sin in us to keep you from him. Andy Moore can go across the ferry in the morning to get over the minister."

On the next evening the clergyman who officiated in Portaferry instead of the Rev. Mr. Dickson, who had been taken prisoner as a rebel, reached Alice's father's. As he left the shore at Strangford he was followed by George Macoubrey, who had noticed his crossing the ferry. While the clergyman directed his course toward the residence of his uncle, he became violently excited.

"He's going there," he muttered, "for no good. And he's to remain all night, I heard him say. I'll watch him. If that skulking villain Maxwell is about the neighbourhood, they may have a meeting when they think other people are in their beds. But they won't deceive me, if I should be cursed out of the country for what I do. Oh, how sweet is revenge, though only enjoyed by anticipation!"

The clock was just striking eleven as Maxwell and Moore reached the house. The servants had retired, but the family were waiting his coming. Moore, as a watch, remained outside in the darkness. He had crossed into an open shed to the right of the house, where he had been standing for perhaps half-an-hour, when he observed a man stealthily approaching the house and attempting to peer through the window of the lighted room where the party inside were assembled. The man then moved to the door, which he noiselessly opened and then entered. Not more than two minutes elapsed when he appeared again. Rapidly he passed the shed without noticing Moore, who saw it was Macoubrey; and as he listened for a moment he heard him rushing hastily in the direction of Strangford. Moore quickly entered into the house, and reached the room just as the marriage ceremony was begun.

"Fly! fly!" he exclaimed to Maxwell; "Macoubrey followed you into the house, and now he's flyin' like a madman to the town to raise the guard. They'll be here and on us unless we run smart for it."

Consternation overwhelmed the party; for a moment they knew not what to do. Maxwell cast his arms around his intended bride, as if to bear her off with him.

"Come, darling—come, my own Alice," he cried; "we can reach the boat in safety with God's blessing. In France you will become my wife, and till then——"

"No, Charles," said the father; "she is yours, and your wife she shall be, but not now—now you must be separated. She will remain till better days unite you; but, for God's sake, fly now—not a moment is to be lost."

Her mother used similar language.

"Father—mother!" exclaimed the agonised girl, "I cannot leave him. Let me go. Let my brother James accompany us till he sees us married, and he can return to you. But don't keep me from him: my heart will break if we're parted. I'll go with you, Charles—I'm ready."

The clergyman—who had been conversing hurriedly aside with James and Andy Moore, who left the room—here interposed:—

"It's a great extremity in which we are involved through that wretch, Macoubrey; but I think we may yet escape him, and overmatch his villanous treachery. Moore is off to act the decoy. He will lead the guard to Audley Castle, while James sets off slowly in that quarter with a light, to which Moore will attract the notice of the guard. I will accompany your daughter," he said. "For my own safety, perhaps, it is as well I should, for a time, cross over to France. Once we reach the cutter—which I hope we will without being intercepted—I will perform the interrupted ceremony. Now we must hurry forth."

We need not describe the farewell between the different parties. Maxwell and his noble-hearted companion, and the clergyman, struck at once into the fields in their rapid flight—moving away as far as possible from the way that Macoubrey and the guard might be advancing. It was a dark night, and therefore most favourable to their escape.

Leaving them hastening with trembling eagerness toward the shore, and in more imminent danger than even they anticipated, we shall follow the faithful and devoted Moore in his rapid pursuit after Macoubrey into Strangford. He reached the guardhouse just as Macoubrey, with two of the guard armed to the teeth, were leaving it.

"You're here, Maister Macoubrey!" he exclaimed in well-feigned surprise; "an' I thocht you were in your bed while I might be serving you, and makin' a trifle to my ain hand the night. Whar may you be after goin', sir?"

"You're the fellow I saw in my uncle's the other night? What do you want? Where have you been?" sharply interrogated Macoubrey.

"'Deed I'm the same you saw in your uncle's. A quiet man, and a maist kindly man he is, but weak in his way, and much overseen, I'm thinkin'. But it's the officer I want now, and I want him smart, too;" he said, pushing into the guardhouse. "I'm thinkin' I can tell him whar mair than the birds are lyin' the night—for a trifle."

Macoubrey, though boiling to be away, suddenly drew to Moore.

"The officer is not here," he said, "he's not returned from Portaferry; but here's his substitute," pointing to the man in charge of the guard; "tell him and me what you've got to say. Be quick now."

"Then if a body could tak' you to the den of as big a rebel as ever sconced from a hempen cord, what might he get for his trouble? Aye—an' I know whar's the boat that's to tak' him and the silly lass that's been made his wife the night. 'Deed"—giving a sudden start as if the thought had just struck him—"nae doubt they're makin' to his den this minute before they tak' to the boat."

"A hundred guineas is the reward for the man you speak of," cried Macoubrey. "But we know where he is, and will have the bird caged presently. Come along with us, and you'll not want reward."

They pushed on at a rapid pace into the country, Macoubrey, in silence, taking the lead. After about a quarter of an hour's walk Moore quickly drew up to Macoubrey.

"See you yon, maister? Don't you see the movin' light yonder?"

"What is it?" quickly asked Macoubrey.

"'Deed, it's the bridegroom and his bonnie partner; an' they don't think we're so near. Ha! ha! ha! it's to the auld castle they're hurryin' from her father's whar they've been married. I left the house as they were made man and wife. I heard everything through the floorin' of the room I was in, and then run for the guard. I'm thinkin' I'll surely be well feed for my wark this night. Will I, maister?"

"To be sure, to be sure you will. But let us into the fields, men, and after them," said Macoubrey, dashing at once into the direction of the supposed fugitives.

"Tak' a fool's advice, maister," said Moore, "and let us divide. You're weel armed, an' I've a guid freen in this soncy thorn of mine. Let these ither men gang away nearer the shore, lest the party yonder beat us in the race an' mak' off in the boat which is lyin' opposite the castle."

"The man speaks right, sir," said one of the guard; "it would be best for us to separate."

Accordingly they parted. Moore followed closely Macoubrey, who, frenzied to madness, dashed on, pursuing the light. He was about making a spring over a ditch, when in an instant Moore struck him senseless to the earth with a powerful blow from the huge staff he carried.

"You'll lie quietly there, you murderin' spy, afore you push on further the night. If I kilt you outright, you'd only be gettin' a good reckonin' for your villany. Noo I maun to warn maister James with the light."

He then drew from his breast a pistol and fired it—a preconcerted signal between him and Alice's brother. As the report reached the ear of the latter, he extinguished his lanthorn and swiftly returned to his father's house. Outside the house Moore waited for him.

"Maister James," said he, "all is right. You did your part bravely, and my soncy thorn did its part weel, too, by the villain that's lyin' ayont, and who'll lie there for a while. Gang to bed noo, and let a' be quiet when the guard may come. By this time our freens are safe, I hope, in the boat. I maun look to my ain safety too. I'm off to Annalong, and they'll be handy chiels that grip Andy Moore there."

The young man warmly wrung the hand of the faithful fellow as they separated.

Meanwhile, Maxwell and the companions of his flight reached the shore without interruption. Thanks to Moore, Macoubrey and the guard were far from their path. The boat lay waiting for them, and urged on by four powerful rowers, it sped fast towards the bar. All was darkness on the waters, and no noise was heard save the quick plash of the oars, or the whispers of the fugitives who sat close together in the boat.

Suddenly the steersman bent his ear eagerly towards the Portaferry side of the shore.

"Ease, men; ease a moment. Hist!" he exclaimed, in low tones.

A boat not fifty yards distant was fast approaching them. It was Captain Mathews in his barge, crossing from Portaferry to his vessel. He had run out a little way towards the bar on a tour of inspection and was now returning.

The advance of the lugger's boat was noticed by Captain Mathews, just at the time her crew were alarmed by the appearance of the cutter's barge. He hailed the boat as she shot ahead with redoubled speed.

"Boat ahoy! Who are you? Where are you going?"

"Say we're the 'Fanny,' making out to fish at the bar," said Maxwell to the steersman, who gave the answer accordingly. At the same time the oarsmen continued their vigorous efforts, and the boat, like an arrow, sped along. Now it so happened that the real "Fanny" had reached Portaferry just as Captain Mathews was leaving, and this fact, together with the haste of the boat to get out of his way, convinced him all was not right. He therefore again hailed the boat:

"Hillo, friend, I fancy you've mistaken your name. Pull up till I speak a word. Refuse to ease your oars at your peril, I say."

The boat sped on. The oarsmen pulled now for life and death. There was a sudden flash from the barge, and a report. Captain Mathews was firing on the boat. Instantly Alice lay down in the boat by the direction of Maxwell and

his companions, while shot after shot followed them in their flight. Fortunately the lugger's boat had got out of pistol-range. The chase had continued for more than half an hour, when Maxwell, who had been watching with intense anxiety for the appearance of the lugger, uttered a joyful exclamation:

"Hurrah, boys! there's our lugger. We're safe, thank God!"

A triumphant cheer burst from the lips of the exhausted oarsmen. In a few minutes after, the fugitives were on board the smuggler. Meantime the brave Captain Mathews held on the pursuit until he came within sight of the lugger. The skipper hailed him as he advanced:

"Hillo, Captain Mathews! do you hear? Advance another boat-length, and I'll blow you out of the water. We have old scores to settle; but to-night you're no fair odds against us, and we spare you."

Fortunately, there was no occasion to fulfil this threat. The anchor of the lugger was quickly weighed; her expanded sails caught the freshening breeze from land, and, dashing through the waters, she was soon far distant from her pursuer, and reached the French coast. On the day of landing, Charles and his affianced devoted bride were united in marriage He entered the French army, and afterwards became distinguished as a gallant and able soldier. General Maxwell and his wife still live, highly honoured, in the land of their adoption, and blessed in the midst of a happy and united family.

THE BANKS OF THE OHIO.

RAFT ON THE OHIO.

THERE is no parallel in European history to the tale of the growth and progress of such American states as Ohio, Indiana, and Kentucky, which have sprung up as if by magic. Less than ninety years ago, not a white man breathed within the limits of places which soon were to be covered with cities and the signs of cultivation. Wondrous have been the changes since that day. The rude exuberance of nature has yielded to the patient labour of the woodsman; peaceful flocks and herds are seen, where then were the wild animals of the forest; the busy hum of business is heard, where the yell of Indian warriors but yesterday seemed to awake the echoes. All is changed save the watercourses, the hills, and the traditions which still hover over the land like a mantle of romance and mystery.

The red-skins, the prowling Indians, who claimed a sovereignty over these dark deep forests—a sovereignty they strove to maintain by the exercise of every cruelty which the mind can conceive, by the display of a patience, an indomitable energy which might invest them with permanent interest but for their barbarism—are gone; and we can little regret them. It has been truly said, that "pity, which the Indian can feel at another moment as deeply, perhaps as benignly, as a white man, seems, and is, during the torture, entirely unknown—as much, indeed, as if it had never entered into his nature." His mind is willingly given up to the intoxication of passion, and cruelty, in its most atrocious and fiendish character, reigns predominant. The familiar of a Spanish inquisition has sometimes moistened the lips of a heretic stretched upon

the rack—the buccaneer of the tropics has relented over the contumacious prisoner gasping to death under his lashes and heated pincers; but it is said that there is no instance of an Indian when torturing a prisoner at the stake, the torture once begun, being moved to compassion, or to regard with any feelings but those of exultation and joy the agonies of his victim.

It is scarcely to be wondered at that, after a struggle of some fifty years—bloody, fearful, perilous, full of suffering and horror—they have disappeared; nor that this happy region should now, when it is smiling and prosperous, still retain, in memory of its early history, the strange appellation of the Dark and Bloody Ground.

Those were terrible days, when no man could go from home without expecting that, in his absence, the red men, who

FARM ON THE OHIO.

spared neither age nor sex, might come down like a wolf on the fold, and deal death on all hands; when, day after day, the colonists were compelled to leave the hoe and the plough, and, clutching the rifle, do battle for their homes and families from behind palisadoes and logs, or, uniting in large bodies, go forth and fight, with varied success—with fearful loss and slaughter sometimes, as at the Blue Licks.

There is scarcely one spot now inhabited and cultivated on the banks of the Ohio which has not its tale of woe and massacre to tell. To give a faint idea of what this part of America was in the early days of its settlement many tales of massacre could be told. One narrative will, however, suffice. It happened in 1787, at the house of widow Scraggs. This person occupied a double cabin in a very lonely part of the country. One room was inhabited by the old lady herself, together with two adult sons, and a widowed daughter with a baby at the breast; the other room contained two girls between sixteen and twenty, and one about eight.

It was eleven o'clock at night. One of the unmarried daughters was busy at the loom. All the others, one son excepted, were asleep. Some signs of strange import had alarmed him. Owls had cried to each other from the adjoining wood most mysteriously. The horses in the pound, near the house, had snorted and shown uneasiness, as if some terrific object were near at hand. The young man felt very much inclined to wake his brother, but he was not certain, and he waited. Suddenly, however, he heard steps in the yard, followed by several knocks at the door, with the usual expression, "Who keeps house?" in plain English. The young man immediately supposed that it was some benighted settlers, and advanced to the door to open it. But the widow Scraggs sprang from her bed, and declared from her long experience of the frontier that they were Indians. She then awoke her other son, and the two young men taking their rifles prepared to do battle.

The Indians now began to thunder with more violence, no longer concealing their true character. A shot from a loophole, prepared for the purpose, started them, however, to cover. But they soon found the door of the other cabin containing the three daughters, and upon this the rifles could not be brought to bear. Some nails from the yard fence enabled the red-skins to force the door off its hinges, and the three girls were at the mercy of the Indians. One, who was in bed, was secured; but the eldest, who had been working at the loom, fought with a knife, and killed an Indian, before

she herself was tomahawked. The little girl, meanwhile, who had not been noticed by the Indians, ran out into the yard, and might easily have effected her escape, had she taken advantage of the darkness and fled; but, instead of so doing, the terrified little creature ran round the house, wringing her hands, and crying out that her sisters were killed. The brothers, unable to hear her cries without risking everything for her defence, rushed to the door, and were preparing to sally out to her assistance, when their mother threw herself before them, and calmly declared that the child must be left to her fate, that the sally would sacrifice the lives of all the rest, without the slightest benefit to the little girl. Just then the little girl shrieked, then moaned, and then all was over. Then the crackling of flames was heard, with a fierce and terrible yell from the Indians, a cry of triumph at their having fired the division of the house inhabited by the daughters, of which they were masters.

The position of the colonists was now fearful in the extreme. The whole house, which was dry and inflammable, was in flames; and it became necessary to abandon it or perish. There was a chance of escape in the one instance, while in the other their fate was certain and terrible. The rapid approach of the flames cut short their momentary suspense. The door was thrown open, and the widow, supported by her son, tried to cross the fence at one point, while her daughter, carrying her child in her arms, and attended by the younger of the brothers, ran in a different direction.

The blazing roof shed a light over the yard but little inferior to that of day, and the savages were distinctly seen awaiting the approach of their victims. The old lady was permitted to reach the stile unmolested, but, in the act of crossing, received several balls in her breast, and fell dead. The son, more fortunate, by extraordinary agility effected his escape. The other party succeeded in reaching the fence unhurt; but in the act of crossing were vigorously assailed by several Indians, who, throwing down their guns, rushed upon them with their tomahawks. The young man defended his sisters gallantly, firing upon the enemy as they approached, and then wielding the butt of his rifle with a fury that drew their whole attention on himself, gave his sister an opportunity of effecting her escape. He quickly fell, however, under the axes of his enemies, and was found scalped and mangled frightfully in the morning. The elder brother, the married sister and her infant, were all that escaped; for those who went in chase of the girl of sixteen, taking unfortunately a bloodhound with them, gave the alarm to the Indians, who slaughtered the unfortunate creature. Not one of the Indians, however, escaped to tell the tale.

Few rivers exhibit more pleasing characteristics than the Ohio; the *Belle Rivière* as it is called by the French. In the early days its pellucid waters, smooth and glassy, glided amid endless forests, vast solitudes and cane-brakes, dangerous indeed to the traveller. But soon signs of life and civilisation were noted. Men in rugged coats and of wild mien landed at tempting spots and began to lay open the forest. The water began to be covered by men moving along in various ways. There was the Alleghany skiff, the *dugout* (formed from a single tree), the *pirogue*, the keel-boat, the covered sled, the flat-boat, and every other kind of transport which the ingenuity of man could devise. The broad-horn was one of the most original. It was a kind of floating house, as broad as it was long, with rooms for man and beast, for cattle and horses, and dogs and pigs. It had neither bow nor stern, neither starboard nor larboard, so that if it struck the shore and was pushed off, it was always ready for a start.

There was much travelling on the Ohio, and in spring the scene was delicious. Gigantic sycamores, the growth of ages, trees of varied leaf and hue lined the way, except where, here and there, some little receding cove, some little prairie, covered by wild flowers, varied the scene. There was not a living soul to be seen for hundreds of miles. And yet behind these trees, lurking in these beautiful prairies, were hordes of wild men, troops of savage beasts; and many a terrible adventure might be recorded, of which that river was the theatre. The roving bands of Indians were constantly hovering upon either bank of the Ohio, and were in the habit of decoying boats ashore under various pretences, and murdering or taking captive all who were on board. A sharp look-out was therefore kept, and if the smoke of a fire was seen ascending in thick wreaths above the trees, or floating in thin masses over the bed of the river, that spot was avoided. But the Indians were so cunning that all the precautions in the world did not suffice entirely to defeat them. They would set white prisoners on the bank, who, to save their own lives, would delude others to captivity and death.

Many traders ventured long journeys along the Ohio in boats, and escaped unhurt, but only by persevering in their determination to resist all temptation. But the Indians were not the only dangers of that wilderness of woods and waters. Inundations were common, and it was considered a good joke on the Ohio when Zeph Hagg told of his tying a boat to a tree, and awaking in the morning with himself fifty feet up in the air, the inundation having fallen and left the lofty tree bare. The inundations of the Ohio were very heavy sometimes. The gigantic trees on the bottoms, as they are called in the language of the West, stood midway in the waters; the banks of the river could nowhere be seen; and then, when the subsiding of the waters came, the scene was serious indeed.

It became then a matter of much difficulty to manage the broad-horns. The increased velocity of the current, the eddies, the whirlpools, the new currents caused by the force of the pent-up waters, made them unmanageable. If a village was seen, it could only be distinguished by the chimneys and roofs peering above the waters, while boats were moving to and fro, removing women and children and all valuables to the hills. Those who have witnessed the periodical inundations of the Nile will scarcely form a just conception of the overflowing of an American river bordered by immense forests.

Often a fleet of boats, encouraged by numbers, would go some distance inland, and anchor over some cane-brake or hollow, a good distance from the river, and then encamp on a little hill until the waters showed some sign of subsiding. This scene would present features quite novel to us. There would be seen boats, with pigs and sheep for New Orleans, cargoes of emigrants for Bois Brulé, loads of boards and planks, of cider and whiskey. A fair was knocked up on these occasions, and "a deal of traffic" was done; so that between fighting, drinking, gambling, and trading, the time would pass pretty swiftly. Sometimes they would have a dance, or they have been known to improve the occasion by hearkening to some zealous preacher about to establish himself in the dark backwoods. Then the wooden trumpets would sound, as a signal that the inundation was abating, and away these strange customers would go on their several journeys.

How the scene has changed! Look at that quiet farm-house represented in our engraving (p. 437). That spot was once a thick and tangled wood, the lair of the panther, the hiding-place of the Shawnee. But no more shall the sound of the war-whoop be heard in the land. Boats still float on the Ohio, but in peace and tranquillity. Village spires, thatched roofs, open fields, roads, cultivated grounds, and large and populous cities, now stand along the banks of the Ohio; and the sound of village bells, the lowing of cattle, and the bleating of sheep are heard, where the shriek and horrid cry of the dark man of the woods was once so frequently distinguished.

Instead of the broad-horn, the steamer now hurries up and down the stream, while merrily sing the boatmen of the Ohio, on the great wood-rafts which they thus convey to the large towns and sea-ports below. The change is pleasing, satisfactory, and agreeable. A fierce and terrible battle-ground has become the abode of peace and plenty; civilisation and her handmaid Christianity overspread the land, which now feeds and supports millions of men, instead of barely giving life to some few hundreds of yelling savages.

The fate of the red man is sad, but it is inevitable. Where

he has accepted civilisation, as in the case of the Cherokees, he is saved; he has government and education; he cultivates fields, and wanders no more; and his villages, once the scene of torture and violence, are inhabited by men who, once savages, are now civilised, with churches, preachers, books, newspapers—all the work of their own race. But when the red-skins stick obstinately to their traditions, defend every inch of land to the last—kill, scalp, burn, and destroy the colonists at every opportunity, and play, in fact, the part of wild and savage beasts—they must perish. The creation of new states, where the wearied millions of Europe may find new life and independence, cannot be checked because the Shawnees, Creeks, and Comanches wish to stick to their old habits. They may resist on the frontiers for a while, while fighting against only one or two men, like Boone, or Harrod, or Wurtzel; but they must soon yield as population progresses, and in the course of time their old land shall know them no more, and every fertile and likely spot of land on the great continent of North America be as safe, as civilised, as progressive, as rich, and as productive of men and things, as are now the shores of the "Beautiful River"—the banks of the great Ohio.

The state of Ohio is about as large as the kingdom of Portugal. It contains hills, mountains, plains, woods, forests. Its climate is colder in winter, and warmer in summer, than England. It produces Indian corn, wheat, rye, oats, barley, tobacco and cotton, English fruits, grapes, and wine. Bears and deer are numerous. Its population is nearly two millions. It was only permanently settled in 1788. Its capital is Columbus, on the Scioto river, on a spot which in 1812 was covered by trees. Its great city is Cincinnati, where a great trade is carried on; its excellent University of Athens is celebrated in America. It contains some ruins very much like those found by Stephens in Yucatan.

ORCHIDS.

The orchid tribe are, if we may so say, the most eccentric of all the vegetable kingdom. Almost everything about these plants deviates from the usual types and ordinary habits of vegetation. Some—and indeed the greater number—live as parasites on the bark of large trees in the forests of inter-tropical regions. These are called epiphyte orchids; the others, which derive their nourishment from the soil, are called terrestrial orchids.

The epiphyte orchids are the most beautiful ornament of those arches formed by the gigantic trees of the hottest countries in the continents of the Old and New World. The shade and moist warmth are particularly favourable to their mode of growth. In all the cold and temperate climates of the European continent, the oaks and beech-trees of our forests cover their bark with mosses and lichens; in tropical climates, on the contrary, trees of every variety of form and size are covered with orchids, forming, immediately after the rainy season, which takes the place of winter, lovely garlands rich in colour and delicious in perfume. These charms, of which nothing in Europe can give any adequate idea, last unimpaired for several months.

The splendid flowering of the orchid tribe is an object of admiration even to the savage tribes of the New World. When the Spaniards penetrated for the first time into the thinly-peopled districts of Central America, they were struck to see the huts in the villages covered with magnificent orchids principally belonging to the genius *Lælia*, the flowers of which are very much elongated; and this kind of decoration subsists at the present day. Many orchids are provided with particular organs which are neither branches nor roots, but are called aerial roots, because they strike out into the air in all directions and derive part of the nourishment of the plant from the atmosphere. The long duration of the flowering of orchids arises from the tardy action of the reproductive organs. Fertilisation is carried on very slowly; indeed it is often not fully accomplished at all. The corolla, which constitutes what is generally the coloured part of the flower, does not fade until fertilisation has been completed, and when this is not done the corolla may last two or three times the length of the ordinary time. Thus in European green-houses it is sometimes rather difficult to get orchids to flower; but when this is effected, all efforts are amply repaid by the extraordinary duration of their flowering time. When cultivated in hot-houses under the influence of a very warm and at the same time moist atmosphere, orchids rarely produce fertile seeds; yet instances of multiplication by seeds produced under such circumstances have occurred within a few years both in this country and in Ireland. The greater part of orchids can only be propagated by the separation of their rhizomes, which are bulbous stems rooting into the ground and each capable of producing a complete plant. When we consider the numerous difficulties and dangers involved in penetrating wild forests and unhealthy regions to obtain new orchids, it is not surprising that these beautiful plants should always fetch a high price in Europe. There are some wealthy amateurs in this country who pay enormous sums for them.

A year or two ago, Mr. Henderson, the horticulturist, succeeded in getting an orchid, of the genus *Cattleya*, to flower for the first time in Europe. A noble and wealthy duke went, according to custom, to inspect his conservatories, accompanied by a young lady of his family, who was passionately fond of flowers, and whose admiration was riveted by the new *Cattleya*, which surpassed anything of the kind she had ever seen. The duke, going to Mr. Henderson, pointed to the flower, and asked the price. In vain did Mr. Henderson protest that he did not wish to sell it at any price, that it was the only thing of the sort in Europe, and that he was unwilling to part with it to anybody till he had first propagated it. The imperturbable duke, holding out a pocket-book full of bank-notes, replied to all his protestations by simply asking the price. At length the horticulturist, weary of the contest, consented to accept a large sum and allow the duke's fair companion to carry off the plant. We do not feel at liberty to state the exact amount; suffice it to say, it was as much as it would take a clever workman several years to earn.

Though travellers had for many years spoken highly of the singular organisation, beauty, and fragrance of epiphyte orchids, it was not till thirty years ago that horticulturists in this country knew how to cultivate and propagate them with success. One of the first to overcome the difficulties in the way was the late Mr. Cattley, from whom the plant just mentioned derived its name. British skill and perseverance soon met with their due reward, and orchids are now raised by cultivation to a degree of perfection altogether surpassing that which belongs to their natural condition. While before 1820 scarcely any English garden could produce twenty distinct species of this tribe, some of the nurserymen near London can now exhibit more than a thousand. What cultivation has done for roses, dahlias, tulips, and other flowers, has been accomplished with equal success in the case of this remarkable and beautiful tribe. They have been rendered much more productive, so as to contain twenty or thirty blossoms on a cluster, while in their natural state they bore only two or three. They have also been made to assume much larger proportions, a richer fragrance, more glowing colours, and a more beautiful aspect altogether.

The plant represented in our engraving (p. 440) is, as the reader will see, an *Acinetum*, an orchid only lately introduced into Europe, and still rare even in the finest collections. Like many of the genera *Dandrobium*, *Stanhopæa*, and the *Aerids*, the flower-stalk of the *Acinetum* does not spring upwards from below, but in the contrary direction. In its native region its flowers hang in garlands all along the trunk of the tree on which the plant lives as a parasite.

One advantage of cultivating orchids is, that, as they flower at various seasons, the possessor of a moderate collection may

THE ACINETUM—A SPECIES OF THE ORCHID TRIBE.

expect always to have some in flower, no matter what is the time of the year. Hence it is not mere caprice that renders them objects of so much favour among opulent amateurs. They are worthy to be prized on several accounts, especially the care and skill required to preserve them in a flourishing condition.

SIR ROBERT PEEL.

STATUE OF SIR ROBERT PEEL, BY GIBSON, IN WESTMINSTER ABBEY.

It is seldom that an impartial estimate can be formed of the character of those who have played a prominent part on the arena of politics until a considerable time has elapsed after removal from the scene of their labours. They are viewed in their own day through the coloured glass of faction, and it is only when time has tempered the fury of the passion engendered by party zeal and antagonism that the real worth of their labours can be discerned and appreciated. But with

Sir Robert Peel the case is otherwise; his measures were of so thoroughly practical a character that common sense is sufficient to form an estimate of them; and this is, perhaps, the highest meed of praise that can be awarded to an individual who labours for the present generation as well as for posterity.

Sir Robert Peel was the eldest son of the first baronet of the name, and grandson of Mr. Peel, of Peel Cross, in Lancashire. The former was a cotton manufacturer at Bury, in that county, and realised a large fortune in business, chiefly by his success in bringing into operation the machine known as the "spinning-jenny." Having strenuously supported the political and commercial system of Mr. Pitt, and presented the government with the munificent gift of £10,000 for the purposes of the war with France, he was, in 1801, created a baronet; and in the following year he introduced a bill into parliament to ameliorate the condition of apprentices employed in the cotton and woollen trades. He was the largest manufacturer of cotton goods in this country, employing no less than fifteen thousand hands; and the fortune which he accumulated enabled him to place all his children in a position of affluence long before his death, which took place in 1830, at the age of eighty.

His eldest son, the subject of this memoir, was born Feb. 5, 1788, and received his education at Harrow and Oxford, at both of which places he was distinguished by the diligence with which he pursued his studies, and the invariable decorum of his manners. At the university he took the degrees of M.A. and D.C.L., and on leaving it, at the age of twenty-one, he was returned for the borough of Cashel, then a pocket constituency, and still notoriously corrupt. His father's wealth and the favour of Pitt caused the young M.P. to be selected to second the address on the opening of the session of 1810, the tendencies of which may be inferred from the political character of a ministry headed by Perceval, Liverpool, and Sidmouth. His talent for debating and his capacity for public business were soon perceived, and in 1811 he was appointed Under Secretary of State for the Colonies, the post now filled by his second son, Mr. Frederick Peel, member for Bury. In the following year he became Chief Secretary for Ireland, a post which he held for six years, his policy being in strict accordance with the despotic and bigoted government which then prevailed, and of which his colleague, Castlereagh, was the congenial representative.

In 1817 he was elected one of the members for the University of Oxford, a constituency to which the ultra-high church and extreme conservative views he then held were recommendations more valuable than any others; and in the following year he resigned the Irish Secretaryship, and undertook the chairmanship of the Bank Committee, in which capacity he introduced his bill for the resumption of cash payments, generally known as Peel's Currency Bill, though the chief merit of the project belonged to Mr. Horner. This measure has been much assailed, both in and out of parliament, during the period that has since elapsed, but its principles have been adhered to by every successive administration. In 1822 he succeeded Lord Sidmouth as Home Secretary, with a seat in the Cabinet, and being regarded as the champion of the anti-Romanist party, he, to a certain extent, divided the leadership of the House of Commons with the celebrated Canning. Among many other excellent measures which he brought forward during this period of his parliamentary career, his admirable and humane plans for the reform of the criminal code, which were carried in 1826, must not be forgotten.

Previously to this, in 1820, Mr. Peel had entered the matrimonial state with the daughter of General Sir John Floyd, who was second in command at the storming of Seringapatam; and by this lady he had five sons and two daughters, the eldest of the former, who succeeded to the baronetcy, having been for several years attached to the Swiss embassy. On the dissolution of the Earl of Liverpool's administration in 1827, and the succession of Canning, at that time the brightest star in the political firmament, to the premiership, Mr. Peel and five of his colleagues retired from office, through open and avowed hostility to the views entertained by that eminent statesman on the question of Roman Catholic emancipation. Canning, after a very brief enjoyment of the sweets of office, died in August of the same year, and was succeeded by the weak and equally short-lived administration of Lord Goderich; which again gave place, in January, 1828, to the stronger government of the Duke of Wellington. This cabinet must be regarded as representing the school of Sidmouth and Castlereagh, from which Canning was a seceder. Mr. Peel was appointed to the Home Office under the great duke, and almost immediately received from Lord John Russell, then an active leader of the Reform party, a signal defeat on the Test and Corporation Acts, the repeal of which the government, however reluctantly, were obliged to concede. Peel, indeed, opposed but a feeble resistance to Lord John's measure; and it is probable that he already saw the necessity to his future fame of a departure from those worn-out dogmas which had hitherto governed the country, and to which he had thus far closely adhered. In 1829 the Catholic Disabilities Bill was introduced by the government,—not apparently from changed convictions on the subject, but, as the Duke of Wellington stated in the Upper House, to prevent the horrors of civil war. In the House of Commons, Mr. Peel expressed himself in a similar manner:—"He should follow the example of the pilot," he said, "who did not always steer the same course to guard his ship from danger, but a different course under different circumstances as they arose, in order to save the vessel from the very dangers which the captain and the crew most dreaded."

The bill was carried, and the excitement produced by it throughout the country was immense. It was a rare and striking instance of a measure of justice and amelioration being brought into operation by a government in opposition to public opinion. The ultra-Protestants laboured to raise the spirit of bigotry, and relume the torches that fired the metropolis in 1780; they accused Peel of having betrayed them; and so great was the dissatisfaction expressed by his constituents at Oxford, that he felt himself called upon to resign his seat. He again presented himself as a candidate, however; but men's passions were too fiercely excited for the voice of reason to be heard, and he was rejected for Sir Robert H. Inglis, who kept the seat till the present session of 1854. By an arrangement with Sir M. Lopez, uncle of the baronet of that name who lately represented South Devon, he was returned for the close borough of Westbury; but his father dying in 1830, he succeeded to the representation of Tamworth along with the baronetcy, and continued to sit for that borough till his death. The outbreak of the French revolution gave such an impetus to the cause of parliamentary reform, that the ministry saw that resistance to the popular demand, weakened as the conservative party was by the divisions created by the Catholic emancipation question, would be ineffectual; and, to avoid facing it, the Duke of Wellington conveniently took occasion, from a defeat on Sir H. Parnell's question for a revision of the civil list, to retire from office.

Sir Robert now became the acknowledged leader of the conservative party, which arrayed itself for the great struggle of parliamentary reform. His opposition to the Reform Bill introduced by the Grey administration, which had succeeded that of the Iron Duke, was able and persevering, but fruitless; the popular cause triumphed, because the people were united and had confidence in their leaders. That confidence was betrayed, and partial success divided one section of the people from the other; for each class becomes conservative as it acquires its share of political power. Grey and Brougham took office in the zenith of their popularity, the latter in particular having enunciated opinions during the Reform agitation that he would now denounce as anarchical and subversive. These men have never been surpassed in violence of declamation while the field was yet unwon; but no sooner were they in possession of the Treasury benches than they began to prevaricate, to belie their solemn promises, and to initiate a reactionary policy. Retribution speedily followed: they were expelled from office in 1834, and Sir Robert Peel was sent for

from Rome to form a new administration. He had reconstructed his party on the basis of the altered constitution of the House of Commons; but ability and organisation did not prevent it from being outvoted on the first night of the session, on the election of speaker; and being thrice defeated on the Irish Tithe Bill, the Peel administration went out in April, 1835, and was succeeded by that of Lord Melbourne and the Whigs. In May, 1839, the ministry were defeated on the Jamaica Bill, and retired for a time from office; but Sir Robert having stipulated that her Majesty should dismiss the Whig ladies of her household, as necessary to his independent action, a feminine conspiracy was formed against him, which obliged him to resign the reins of government almost as soon as he had grasped them. Melbourne and the Whigs returned to office, exulting in the success which had resulted from the machinations of their ladies, but so damaged in reputation, that the conservative leader rose more rapidly in popular estimation as chief of the opposition than he probably would have done at that time as head of an administration.

The retrogressive tendencies and administrative incapacity of the Whigs speedily became so glaring, that when Sir Robert proposed his vote of want of confidence, in May, 1841, a debate of eight nights resulted in their discomfiture—the division giving them a majority of *one*, in a house of 625. Parliament was dissolved, and the Conservative party prepared for a hard struggle to regain the power of which the Reform Bill had deprived them since 1830. Their active efforts in the registration courts, the ruined fame of the Whigs, and the short-sightedness displayed by that party in proposing a fixed duty of eight shillings per quarter on corn, combined to give Sir Robert Peel a large majority in the new parliament; and he immediately availed himself of the advantages of his position to initiate measures which have been of great benefit to the country, and which placed him at once at the head of all the statesmen of the day. In his address to the electors of Tamworth, on his accepting office, he made some observations which shadowed forth his future policy, though their practical drift was not perceived at the time. He said: "If necessities were so pressing as to demand it, there was no dishonour or discredit in relinquishing opinions or measures, and adopting others more suited to the altered state of the country. For this course of proceeding he had been censured by opposite parties—by those who, upon all occasions, thought that no changes were required; as well as by those who, in his opinion, were the advocates of too violent and sudden innovations. He held it impossible for any statesman to adopt one fixed line of policy under all circumstances; and the only question with him, when he departed from that line, should be, Am I actuated by any interested or sinister motive? Do I consider the measure I contemplate called for by the circumstances and necessities of the country?" That Sir Robert was *not* actuated by interested motives is apparent from the fact, that three-fourths of his large property consisted of land; and that Free Trade *was* imperatively called for by the exigencies of the country must now be obvious to all. In 1842 he commenced the changes he had resolved upon by the most extensive revision of the tariff that had ever been made—a measure which gained him the confidence of the party of Cobden and Villiers, and the approbation of the country, in proportion as he lost that of his own party and a large section of the aristocracy. His administration divided upon the question of opening the ports to foreign corn, though famine was then threatening the country; and in December, 1845, the secession of Lord Stanley led to a resignation. Lord John Russell attempted to form a cabinet, but was prevented by disputes among his own followers, and Sir Robert was recalled, as the only hope of the nation, unless, indeed, her Majesty had sent for Mr. Cobden.

Shortly after the opening of the session of 1846, the minister announced his intention of complying with the prayer of the people by entirely repealing the obnoxious corn-law. This announcement created, among his followers and the landed aristocracy, as much confusion and dismay as the emancipation of our Roman Catholic fellow-countrymen in 1829. Again was the minister accused of deceiving and betraying his party and the country; but to all these charges and reproaches he replied with calm dignity, repudiating that inflexibility which is sometimes supposed to constitute consistency, and defending his measures on the ground of their imperative necessity. He persevered, in the most praiseworthy manner, against the bitter but unavailing opposition of the Protectionists; and his policy triumphed in both houses of parliament. Almost simultaneously with the abrogation of the corn-laws, Sir Robert resigned office, an anomalous coalition of Whigs and Protectionists having defeated him on the Irish Coercion Bill. The Whigs succeeded him in the government, and received his support in all of their measures that deserved it; but he always declared that, from that time, he had no wish to resume office. The last time he spoke in the house was on Friday, the 28th of June, 1850, on the foreign policy of the government. On the afternoon of the following day, while riding up Constitution-hill, his horse started and threw him over his head, falling heavily upon him. He was conveyed home, and medical assistance was immediately procured; but all the appliances of science were unavailing; he sank gradually, and expired July 2nd, lamented by all who had experienced the beneficial effects of his commercial and fiscal policy, or admired and respected him as an upright and gifted statesman, and a lover of truth and justice. The most accurate estimate ever expressed of his capacity is, perhaps, that in the Biography of Lord George Bentinck, by the Right Hon. Member for Bucks. According to that great authority, in person, Sir Robert Peel was tall and very good-looking; his forehead was high and broad, indicating mental faculties of no common order, and the general expression of his countenance was mild, grave, and dignified. Endowed by nature with a comprehensive and vigorous mind, his powers of application were aided by a memory remarkably retentive, and the communication of his ideas by a clear and fluent elocution. Method and tact were his in a large degree, two qualities invaluable to a parliamentary debater, in which character he has, perhaps, never been excelled. His memory had accumulated a vast amount of political information, in the use and application of which, and in adapting it to the immediate end in view, he was extremely happy. But successful as he was as a debater, he was far from being a first-rate orator; his style was lucid and fluent, but he had very little imagination, and his speeches were impressed with the manner of the lecturer rather than of the advocate. He had a fine voice, and, with more imagination and warmth, would have been one of the best speakers in the house; as it was, he was inferior as an orator to Canning, O'Connell, Disraeli, and other men of less ability.

What most strikes the observer in glancing over Sir Robert Peel's parliamentary career, is the fact that he was always in a state of transition. He was always learning, and as fast as new ideas became impressed upon his mind, he applied them in the administration, and converted them into realities. Hence the apparent inconsistency of his conduct as a politician. Though long the head of the Conservative party, his tendencies were, in many respects, more towards progress than those of many who stood in the front ranks of the Opposition. He was deficient in foresight, however; and this occasionally led him into error, and made his transitions more marked and palpable than they would otherwise have been. But as soon as he detected the fallacy that had led him astray, or became convinced that the altered circumstances of the country required a change of governmental policy, he shaped out a new course with promptitude and decision. The explosion of 1830 showed him that the system of Castlereagh and Sidmouth could no longer be continued; and from that time he acted more independently of his party than any leader had ever done before. His mind seemed to expand as he advanced; and as soon as he saw his way clear, he acted on his new convictions with a disregard of personal consequences which is rarely met with in the atmosphere of party.

SKETCHES OF DOGS BY LANDSEER.

The name of Sir Edwin Landseer is so illustrious, is in so many mouths, is met with in so many books, that the world forgets that he has family connexions as other men—that he had a father and mother just like common people—that he had a brother just as that steady-going, long-haired under-secretary, Mr. Frederick Peel. Yet, strange to say, such actually is the case, and we are guilty of no great breach of confidence in stating the fact. But the fame of the one brother had thrown that of the other, comparatively speaking, into the shade. Such invariably is the case. A man has no chance against his brother. Take another name—get the world to believe that you have no connexion with the artist over the way—and you may do something; but with the same name you have no chance. The one will be successful, and the other for that picture of "Spaniels at Play," which was the gem of the Exhibition last year, and which one young lady said was nice, and another was charming, whilst another termed it exquisite, and another said it was divine.

Thomas Landseer is the brother that the world does not make much of. It may be that, like Uriah Heep, he is "an 'umble individual"—that he does not aim high—that ambition does not run in his veins—that his blood is cooler than that of Edwin. One thing is certain, that he paints but little, that he follows his father's career, and contents himself with the calling of an engraver. Still he can paint and he does paint, and he has his brother's skill for painting animals. We have already given our readers two engravings illustrative of that fact; we now give them two more. Let us begin with

POLITICAL DOGS.

neglected. The world is a hard world. Its sympathies are sparse and difficult to be got at; it is frugal of admiration; it is getting old now, and, like all old people, it grows cynical and severe. Hence, if it can be got to admire one of a family, it stands to reason that it will have but little of its favour to accord to the rest.

Thus, by the side of his brother, Mr. Thomas Landseer is almost an unknown man. We don't read in the *Court Journal* that he has painted a pug for the Prince of Wales, or a poodle for the Princess Alice. We don't hear that he has been down to shoot with Lord Verisopht on his Norfolk estates, or that he was at the Marchioness of Broadstairs' delightful *déjeûner à la fourchette* last week; nor that that rich old banker, Mr. Jones Smith, has given him a cheque for a thousand pounds

POLITICAL DOGS.

Pardon us, good sir, for referring to them. The race is nearly extinct now. They have been banished with other vermin off the face of the earth. Men and dogs are now learning the wholesome lesson, that they can be bettered by no Society for the Universal Emancipation of Rascaldom, by no theory of government, but only by their own genuine and honest worth and will. But there were snarling, snapping, ill-conditioned curs, like those our artist has portrayed, that at one time thought otherwise. Ill born and bred, they were a terrible nuisance in their time, always wrangling and interfering, and minding everybody's business but their own. The whole lot, we'll be bound to say, are not worth a rap; not worth even

stealing, unless by a skilful artist, who could touch them up a bit; paint here a little black and there a little brown, crop their ears and caudal appendages; add here a little and there a little; give them a faint air of fashion, and so fit them for Regent-street. Otherwise they are fit for nothing; and when doctored for the market, are, like Peter Pindar's celebrated razors, only fit to sell. You can't trust them. They are as deceitful, fickle, untrustworthy, unprincipled, as it is possible for dogs to be. As to principles, they have not the faintest idea of them. All they care about is the pickings of place. Give them a bone, and they will rush to it from all sides. They realise, "where the carcase is, there will the eagles be gathered together." That wild and wondrous tale, told by sage nurses in our younger days, ere we had tasted of the world's wickedness and ways—whilst we yet believed that the London pavements were all of gold—that tale of

> "Old Mother Hubbard,
> Who went to the cupboard
> To fetch the poor dog a bone,"

which proceeds to tell us how

> "When she got there
> The cupboard was bare,
> And so the poor dog had none,"

could never have been true of your political dogs, who would have soon found out the destitute condition of Mother Hubbard's cupboard, and would have been off with the celerity of express trains to more hospitable and better-appointed quarters. The only exception we would make, would be in favour of that right honourable gentleman—we beg his pardon, we mean dog—upon his legs. He is a dog of substance and of weight; but he is in a hopeless minority, and the opposition have got Hansard to quote against him. But why? Has not a dog a fair right to change his opinions? Do we not alter every day and every hour, and can our creed always remain the same? Who is to stereotype a dog's political opinions? To say, "Hitherto shalt thou come, but no further; and beyond this shall canine intelligence never advance?" The attempt is preposterous. Times change, and we with them. As an illustration of this, take

THE PAUPER'S DOG.

Are there such dogs now? Candidly we confess there are not. But there were. The renegade Alp saw them:

> "He saw the lean dogs o'er the wall
> Hold o'er the dead their carnival;
> Growling and gorging o'er bone and limb,
> They were too busy to bark at him.
> From a Tartar's skull they had peeled the flesh,
> As ye peel the fig when the fruit is fresh."

But we don't see them now-a-days; they are gone with the political dogs, of which they were the cause. Reform is a question of eating and drinking. All rebellions, as Lord Bacon says, are rebellions of the belly. It is with your lean and hungry dogs as it is with your lean and hungry men; they are always dangerous to the state — always on the eve of rebellion — always plotting treasons, stratagems, and wars. At one time they were a common sight in our land. They were present everywhere as birds of evil omen, and the

THE PAUPER'S DOG.

cry and need of reform came from them. The workhouse and reform had a close connexion. It was the want of the one which helped to create the other. The man who could get no work was compelled to bury his poverty and his sorrow in the workhouse, and the poor dog, that had been the companion of his happy hours, had to starve, and moan, and die at its doors. The pauper's dog! What a miserable life! Always sorrow and want, like a dark shadow on his path, with now and then a faint ray of sunshine—but brief, and scant, and rare! He and misery were companions, and all around him were starved and wretched as himself. Howl, poor brute,—howl, with what power there is yet left in thy lean carcase. With thee are our sympathies. Not nature's laws, but man's perversion of them, have made thee the ill-fashioned thing thou art. Happily thy howlings have not been in vain: the pauper tribe is vanishing. Man, all the world over, has ample scope for his energies and powers. He has now breathing-space and vantage-gound; industry has triumphed, and he has come forth from his house of bondage. He is no longer in chains, but free.

PEERS AND M.P.'S,
OR,
LORDS AND COMMONS.

PARLIAMENTARY ORATORS AND ORATORY.

From Fox the transition to Fox's guide, instructor, and friend, till the impulsive nature of Burke led him to leave the party with whom he had always acted, is very natural. "The mind of that man," says Dr. Johnson, "is a perennial stream. No one grudges Burke the first place." When Burke entered parliament he burst at once into celebrity. He spoke, and fame at once gathered around his name. He had not, as some men, to woo the coy goddess through many arduous years. The first speech he could be prevailed upon to publish was that on "American Taxation." It is equal in beauty to any speech Mr. Burke ever composed, and in nerve and force—in all the essentials of eloquence—surpasses them. Of his elaborate speech on the subject of American conciliation, Mr. Fox said: "Let gentlemen read this speech by day and meditate upon it by night; let them peruse it again and again, study it, imprint it on their minds, impress it on their hearts. They would there learn that representation was the sovereign remedy for every evil." His speech respecting Lord Pigott's recall from India "excited," we are told, "such sudden and extraordinary bursts of approbation as were not warranted by the usual practice of the house." Of his speech in moving, in 1778, for certain papers relative to the employment of Indians in the American war, no memorial whatever remains; but a competent judge has said of it, that "he who had not heard that speech, had not witnessed the greatest triumph of eloquence within memory." Burke was the greatest master of metaphor the world has ever seen. As an orator he can never be ranked among the very first masters of the art. He was too philosophical and too imaginative for an orator, whose sole aim should be the conviction and persuasion of his audience. His speeches were precisely the same with his pamphlets. They all read well. Many of Burke's most celebrated auditors admit that the very speeches they had listened to with such doubtful interest in the House of Commons inspired them with the most enthusiastic admiration in print. The very fact that Burke's speeches are read with such interest now is an argument against his being placed in the first rank of orators.

Humour has been denied Burke; but that he had some is clear enough. One day, as Mr. Hartley was prosing, and the benches became emptier every minute, he unfortunately asked that the Riot Act should be read. Burke had long been expecting in agony the conclusion of his harangue. It was beyond mortal patience to endure it longer. Suddenly starting up, he exclaimed, "The Riot Act, my dear friend! the Riot Act! To what purpose? Don't you see the mob is completely dispersed?" Another instance of Burke's wit has also been preserved. On one occasion, seeing Lord North asleep—an indecorum of which that nobleman was frequently guilty—just as Burke was tracing certain Scottish tumults to the indifference of the government, he exclaimed, "Behold what I have again and again said; government, if not defunct, at least slumbers; brother Lazarus is not dead, only sleepeth." Yet Burke's wit sometimes failed him in the hour of need. In the new house which met after Mr. Fox's India Bill had been passed, on which occasion Burke delivered another of his celebrated speeches, when Pitt had reduced a formidable majority on the opposition side into a formidable majority for himself, Burke found himself among strangers, and met with a reception as humiliating as it was cold. No sooner did he rise to speak, than the house resounded with coughing and other equally disagreeable noises. So systematic and persevering were the attempts to put him down, that they often disconcerted and sometimes absolutely silenced him. On one occasion, he parenthetically remarked, that he could train a pack of hounds to yelp with more melody and equal comprehension. An amusing anecdote, illustrative both of the character of the opposition that was manifested, and the want of temper and coolness on his part to meet it, may be related here. He had just risen, on one occasion, with a formidable roll of papers in his hand, when a country gentleman had the impudence to get up and express the modest hope that the honourable member did not mean to read that large bundle of papers and bore them with a speech into the bargain? Burke was silenced; but it was not the silence of contempt, but indignation. He rushed out of the house, unable to utter a syllable. "Never before," said George Selwyn in relating the story, "did I see the fable realised—a lion put to flight by the braying of an ass." Erskine, who himself failed in the house, said: "Burke's delivery was execrable. I was in the House of Commons when he made his great speech on American conciliation—the greatest he ever made. He drove everybody away; I wanted to go out with the rest, but was near him, and was afraid to get out, so I squeezed myself down and crawled under the benches like a dog until I got to the door without his seeing me, rejoicing in my escape." When we read this and remember Fox's thick utterance and ungraceful figure, and Sheridan's Irish brogue, we are almost inclined to suspect the eulogies of those men which have come down to us; yet of Burke's wonderful power, at any rate, there can be no doubt—that fact is clear. Gerard Hamilton, when at variance with him, protested that Burke understood everything but gaming and music. Goldsmith, speaking of Johnson, asked, "Does he wind into his subject as Burke does?" Lord John Townshend, after hearing one of his early speeches, exclaimed, "Good God! what a man is this! How could he acquire such transcendent power?" Lord Thurlow is reported to have expressed an opinion, that he would be remembered with admiration when Pitt and Fox would be comparatively forgotten. Fox himself, on more than one occasion, confessed, that all he had ever read in books, all that his fancy had imagined, all that his reasoning faculties had suggested, or his experience had taught him, were not to be compared to one of Burke's speeches; and Dr. Johnson, than whom no man knew Burke better, said of him on different occasions: "Take up whatever topic you will, Burke is ready to meet you; if he were to go into a stable and talk to the ostlers for a short time, they would venerate him as the wisest of human beings;" and "no person of sense could meet him under a gateway to avoid a shower, who would not go away convinced that he was the first man in England." Gibbon says: "Mr. Burke's reform bill was framed with skill and introduced with eloquence. Never can I forget the delight with which that diffusive but ingenious orator was heard on all sides of the house, and even by those (Gibbon himself as a member of the Board of Trade was one of them) whose existence he proscribed."

We now turn to Burke's countryman, Sheridan—an inferior man, and to us, who can only read his speeches, an inferior orator. In his time, however, he produced unparalleled effects. Unlike Burke's, Sheridan's *début* was unsuccessful. "It is in me, and by —— it shall come out," said he to Woodfall, and for once he spoke the truth. He took pains; he altered his style; he dropped the tawdry rhetoric with which he commenced, and became flippant and smart. One of his best encounters was that with Mr. Pitt, in which the young and audacious minister for once got the worst. Mr. Pitt, says the parliamentary report, was pointedly severe on the gentlemen who had spoken against the address, and particularly on Mr. Sheridan. "No man admired more than he did the abilities of that right honourable gentleman, the elegant sallies of his thought, the gay effusions of his fancy, his dramatic turns, and his epigrammatic point; and if they were reserved for the proper stage they would no doubt receive what the honourable gentleman's abilities always did receive, the plaudits of his audience, and it would be his fortune *sui plausu gaudere theatri*. But this was not the proper scene for the exhibition of those elegancies." Mr. Sheridan, in rising to explain, said, that "on the particular sort of personality which the right honourable gentleman had thought proper to make use of, he need not make any comment. The propriety, the taste, the gentlemanly spirit of it, must

have been obvious to the house. But," said Mr. Sheridan, "let me assure the right honourable gentleman that I do now, and will at any time he chooses to repeat this sort of allusion, meet it with the most sincere good humour. Nay, I will say more—flattered and encouraged by the right honourable gentleman's panegyrics on my talents, if ever I again engage in the compositions he alludes to, I may be tempted to an act of presumption—to attempt an improvement on one of Ben Jonson's best characters, the character of the Angry Boy in 'The Alchemist.'" Sheridan's crowning effort was that celebrated Begum speech, whose effect upon its hearers has no parallel in the annals of ancient or modern eloquence. Mr. Burke declared it to be the most astonishing effort of eloquence, argument, and wit united, of which there was any record or tradition. Mr. Fox said, all he had ever heard, or that he had ever read, when compared with it, dwindled into nothing, and vanished like vapour before the sun; and Mr. Pitt acknowledged that it surpassed all the eloquence of ancient and modern times, and possessed everything that art or genius could furnish to agitate and control the human mind. Tributes of a less distinguished character are common enough. Sir William Dolben immediately moved the adjournment of the house, confessing that, in the state of mind in which Mr. Sheridan's speech had left him, it was impossible for him to give a determinate opinion. Mr. Stanhope seconded the motion. When he entered the house he was not ashamed to acknowledge that his opinion inclined to the side of Mr. Hastings; but such had been the wonderful efficacy of Mr. Sheridan's convincing detail of facts and irresistible eloquence, that he could but say that his sentiments were materially changed. Mr. Montagu confessed that he had felt a similar revolution of sentiment. Perhaps the best testimony to Mr. Sheridan's eloquence on that occasion is the following:—"The late Mr. Logan," says Mr. Bisset, in his "History of the Reign of George III.," "well known for his literary efforts, and author of a most masterly defence of Hastings, went this day to the House of Commons, prepossessed for the accused and against his accuser. At the expiration of the first hour he said to a friend, 'All this is declamatory assertion without proof;' when the second was finished, 'This is a most wonderful oration;' at the close of the third, 'Mr. Hastings has acted very unjustifiably;' the fourth, 'Mr. Hastings is a most atrocious criminal;' and at last, 'Of all monsters of iniquity, the most enormous is Warren Hastings.'" Such sentences as the following must indeed have told with tremendous power. Speaking of the Indian Company, Sheridan said:—"Alike in the military and political line could be observed *auctioneering ambassadors* and *trading generals;* and thus we saw a revolution brought about by *affidavits*—an army employed in *executing an arrest*—a town besieged on *a note of hand*—a prince dethroned for *the balance of an account.* Thus it was they exhibited a government which united the mock majesty of a bloody sceptre and the little traffic of a merchant's counting-house—*wielding a truncheon with one hand and picking a pocket with the other.*"

With one other great name we close this chapter—William Pitt. The heaven-born minister, as his admirers deemed him, had great advantages over his rivals, Fox, Sheridan, and Burke. While Fox was remarkably deficient in all the external qualities of oratory, Pitt was amply endowed by nature with a dignity which seemed to verify the statement of one of his friends, that he was born to be a minister. Like his illustrious relative, the immortal Chatham, his manner was as powerful as his tongue. When Erskine made his maiden speech, Pitt's coolness was too much for him, and the barrister broke down. Pitt, it is said, took a sheet of paper and a pen when Erskine rose, as if he expected to find in the latter a formidable foe. For the first few minutes he was all attention; in a short time his attentive air vanished, he threw down the pen and paper with a scornful smile, and shortly after left the house. Poor Erskine was unnerved by such treatment.

Pitt's *début*, in 1781, was very happy. As the son of the great Chatham, much was expected; and the young orator of twenty-two was equal to the occasion. In the progress of his speech, Sir W. Wraxall tells us, he gave vent to a kind of witticism in which he did not often indulge afterwards, but which derived its strength from a pride of manner and spirit that never quitted him. Lord George Germaine having some verbal communications to make to Welbore Ellis, who sat near him, they entered into a conversation in whispers, which irritated the young orator. Looking round the house, which was all ear, he said, in a tone more impressive than the manner of the reproof, "I shall wait till the Agamemnon of the present day has finished his consultations with the Nestor of the Treasury bench." The effect was electric; even the haughty and supercilious Lord George was cowed, and both he and Ellis sat down in confusion and became silent. As a speaker, Pitt possessed extraordinary powers. He was clear, fluent, and singularly correct in his diction, unimpassioned, and seldom rising into flights of eloquence. His argumentative powers were of a high order, and the clearness and precision of his mind fitted him admirably for those minute financial statements which formed an important part of his official duties. His voice, though wanting in variety, was sonorous and impressive in an extraordinary degree; his action, though awkward and ungainly at first sight, was not unpleasing nor unsuited to his discourse. If we doubt whether he was "the pilot who weathered the storm," we must all admit that he had the coolness and nerve requisite in the nation's pilot in those times of difficulty, of danger, and distress. "Pitt," said Mr. Windham, "could speak a king's speech off-hand." As an orator, he deserves far higher praise. Lord Brougham thus describes him: "With a sparing use of ornament, hardly indulging more in figures or even in figurative expression than the most severe examples of ancient chasteness allowed, with little variety of style, hardly any of the graces of manner, he no sooner rose than he carried away every hearer, and kept the attention fixed and unflagging till it pleased him to let it go, and then

> 'So charming left his voice, that we awhile
> Still thought him speaking, still stood fixed to hear.'

This magical effect was produced by his unbroken flow, which never left the hearer in pain or doubt, and yet was not the mean fluency of mere relaxation requiring no effort on the speaker, but imposing on the listener a heavy task; by his lucid arrangement, which made all parts of the most complicated subject quit their entanglements, and fall each into its place; by the forcible appeals to strict reason and strong feeling, which formed the great staple of the discourse; by the majesty of the diction, by the depth and fulness of the most sonorous voice and the unbending dignity of the manner, which ever reminded us that we were in the presence of more than an advocate or debater,—that there stood before us a ruler of the people." The speech on the war in 1803 is supposed to have been his best speech. In his reply Fox said, "The orators of antiquity would have admired, probably would have envied it." Of his printed speeches, that on the Slave Trade, in 1791, was the most admired. Wilberforce tells us, that its effects on Mr. Fox were manifest during the whole of delivery, while Mr. Sheridan expressed his feelings in the most hearty and even most passionate terms; and we have it from Mr. Windham, that he walked home lost in amazement at the compass, till then unknown to him, of human eloquence. A friend of Mr. Pitt's, in the "Quarterly Review," says of his oratory: "Every part of his speaking, in sentiment, in language, and delivery, evidently bore the stamp of his character. All communicated a definite and varied apprehension of the qualities of strenuousness without bustle, unlaboured intrepidity, and severe greatness. The deportment and bearing of Mr. Pitt in debate might not inaptly be compared to those of his countryman, Marlborough, in the field. His courage, always unconquerable, was never busy, impatient, or passionate, and seemed totally independent of the ebullition of mounting spirits or fermenting blood." Daniel O'Connell once heard Pitt, and he spoke of him as having the most majestic flow of language, and the finest voice imaginable.

THE FATES.

THE cuts we give are a specimen of that grim French wit which often lies behind so impenetrable a veil that we cannot comprehend it. The Bonnarts, during the reign of Louis XIV., published a number of full-length portraits of living personages under allegorical denominations. "The Three Fates," published about 1692, are supposed to be portraits of three well-known court ladies, to whom, as to the famed goddesses, some verses written under them were supposed to apply.

The Parcæ, or Fates, were, in the ancient mythology, goddesses who presided over the birth and life of mankind. They were Clotho, Lachesis, and Atropos, daughters of Nox and Erebus. Clotho, the youngest, presided over birth and held a distaff; Lachesis spun out the story of our lives; and Atropos cut the thread when our time was up. An ancient verse thus describes their attributes:—

CLOTHO.

"Clotho colum retinet, Lachesis net, et Atropos occat."

The power of the Parcæ was great and extensive, Jupiter alone having control over them; even he, as in the instance of Patroclus, being supposed to yield at times to their sway. In fact, the belief was, that they were the sovereign arbitresses of our fate, ruled our lives, and sent us to the shades below at will. By some they are represented as spirits of heaven, by others as something very different. Pausanias gives them other names — Venus Urania, the goddess of birth, Fortuna, and Ilithyia. A fourth was afterwards added—Proserpina, who divides with Atropos the honour of cutting the thread of life.

These goddesses, though supposed to be immutable, were reverently worshipped by the imaginative Greeks. Black sheep were sacrificed to them. They are represented as three old women, with the attributes given in our engraving. Singularly enough, they are considered by Hyginus as the inventors of five letters of the alphabet.

The rare engravings from which the above

LACHESIS.

ATROPOS.

are copied bear the following inscription: "Chez H. Bonnart, vis-à-vis Les Mathurins, ou Coq. Avec privil." They are found in the valuable collection of M. Hennin.

FREDERICK THE GREAT.

The history of the House of Brandenburg has been one of the most spirit-stirring in modern history. In a short space of time we find a little province figuring as one of the principal powers of Europe. This result was brought about by its princes. They were all energetic and determined men; one of them especially was conspicuous for the possession of these qualities—the one whose portrait we have given, and who, in the language of his time, was called the Great. Now men's judgments are better than they were. War we have learnt to think a fearful ill, and the men who create it we deem guilty of enormous crime. But the world did homage to the warrior generally called Frederick the Great. And in truth the title was not undeserved. He was something more than a soldier. He had sound economical views. He did much to improve his country. He had liberal and tolerant aims. He was a statesman as well as a soldier—a man of the pen as well as a man of the sword. He made his country great. Prussia had scarcely an existence till his time. It made great advances in civilisation under him. Though he was a despot and a soldier, Frederick felt that it was the duty of a monarch to make his people as happy as possible; and thus, in spite of arbitrary laws and army flagellations, a certain degree of liberalism made its way into the national heart. His father, notwithstanding his savage temper, had bequeathed to him well-regulated finances and an example of severe attention to business; but he had left the people half-barbarous still, as they had been in ruder ages, oppressed by ignorant government officials—in fact, but little better off than Russian serfs at the present time. The reform Hardenburg introduced in 1818, by which the peasantry of the country became proprietors of the

soil—a change which has been productive of unmixed good—was attempted to be introduced by Frederick. The age, however, was not ripe for it; but the fact shows that he was something better than a fighting monarch,—that he sought to win more permanent laurels,—to achieve a more enduring fame.

Frederick was born on the 24th of January, 1712, in the palace at Berlin. His mother was a daughter of our first George. Though his father was German to the backbone, he received a French education. His first governess was a Frenchwoman. He was initiated from earliest infancy into the French language as his mother-tongue. His food and dress were of the simplest kind. He was kept long in petticoats; and as he himself said, in the last years of his life, he "was brought up on beer-gruel." His constitution was extremely delicate; he was frequently ailing, and his parents, having already lost two infant sons, felt the greater anxiety on his account. The state of his health, no doubt, affected his disposition and manner. In his childhood he was remarkably quiet and dull. On entering his seventh year, Frederick was removed from the tuition of females. His tutors were commanded to make him a Christian, and to pay the strictest attention to his morals. They were commanded not to teach him Latin, but, on the other hand, were to make him master of French, German, and modern history, and, above all, were to excite in him a genuine love for the military profession, and to impress upon him that, as "nothing in the world but the sword can confer honour and glory on a prince, he would be despised by the whole world if he did not love it and seek in it his only glory." Everything that could be done to make him a soldier was done. The king formed a company of cadets, of which the young prince was commander, who was not exempted from any of the duties of his corps, he having frequently to stand sentry before the palace, with his musket and cartouch-box, like any other private soldier. The king strove in other ways to inspire his son with an interest for the military profession. Thus he had a large room in the palace of Berlin fitted up as an armoury, with all the instruments of war. At fourteen, the prince was a captain; at fifteen, major; at sixteen, lieutenant-colonel; and in these ranks he had to do the same duty as any other officer. Never had poor prince a more wretched time of it. His father's harshness and cruelty almost drove him mad. At one time he started for England, but was recovered and brought back. When he became marriageable, his situation was a little improved; but of course the match was a mere state affair:—he married the Princess Elizabeth, daughter of one of the petty German dukes, so numerous till the French Revolution; and when he became king, he never seems to have gone near her Majesty at all. But more attractions awaited Frederick elsewhere.

In 1734 he served in his first campaign, in connexion with the Austrians against the French, who had seized Lorraine and Bar. The prince gave excellent promise, but he seems not unreluctantly to have returned home to write poetry, and to study Bayle and Voltaire till 1740, when the death of his father summoned the prince to take his place. Frederick began his career well. The courts of justice needed a sweeping reform, and he introduced it. The judges were no longer elevated to their places by purchase—the torture was abolished as inhuman. But in the mean while, war, which he had learnt as a profession, was not forgotten—in a few months he was in Silesia, with an army of 28,000. The first great battle he won was at Mollwitz, where 7,000 Austrians were killed and wounded. At Chotersitzo, fought thirteen months after, he was again victorious. When peace was restored, the king found that the war had resulted in adding to his dominion a province comprehending nearly 13,800 square miles, with a million and a half of inhabitants, and yielding a revenue of 3,500,000 dollars. Before entering on his second Silesian war, Frederick found himself still further enriched by the peaceful annexation of East Friedland, in consequence of the extinction of the princes of that line. In 1744, we again find Frederick at war with Austria. The campaign was disastrous; but Frederick was not disheartened. He raised more money, and commenced afresh, and with better success—Silesia was re-conquered. But Austria burnt with revenge, and was determined to strike off his name from the roll of kings. In the hour of danger, however, Frederick was undismayed, and after sixteen months, the second Silesian war terminated as favourably for him as the first. The years of peace were not wasted by Frederick in idle and useless pleasures. His attention was steadily directed to the encouragement of those pursuits which render a state strong and flourishing—to the improvement of agriculture, manufactures, arts and commerce—and to the creation of a military adequate to any contingency. But the time thus devoted did not last long.

In 1756, Frederick again commenced his Austrian war. The battle of Prague was fought in the following year, as was also that terrible one of Rossbach. But, as years rolled away, Frederick found himself growing weaker. England refused further subsidies, and his forces had dwindled away. Greatly depressed by the ruin of his country, he spoke very little and took his meals alone. The reader need only turn to the poems which he wrote at this period to see how deeply he was impressed with the idea that it was impossible for him to escape the fate which Cæsar's victory at Thapsus brought upon Cato. Frederick, however, persevered, and triumphed; but the poison which he carried about with him at the time was found still unpacked after his death. It consisted of five or six pills in a narrow glass tube. But in 1762 peace was made, a peace that left all the parties precisely as they were; yet this second war had cost Frederick 180,000 soldiers, and the allied powers 850,000. This bare statement gives but a faint idea of what war does. Achenholtz, the historian of the war, and an eye-witness of the miseries it inflicted, says: "The sufferings of a great part of Germany were immense. Whole provinces had been laid waste, and even in those that were not, internal commerce and industry were almost annihilated, and this, too, in spite of the large sums which France, England, Russia, and Sweden, had scattered over them through their armies or by means of subsidies. Great part of Pomerania and Brandenburg was converted into a desert. There were provinces in which scarcely any men were to be found, and where the women were therefore obliged to guide the plough. In others women were as scarce as men. At every step appeared extensive tracts of uncultivated land; and the most fertile plains in Germany, on the banks of the Oder and the Wesel, looked like the wilds of the Ohio and Oronoko. An officer affirmed that he passed through seven villages in the Hessian dominions, and met with only a single individual—the pastor of one of them." Such are the results of war. It is time now that the world should refuse to call the man who brings about such results, great. On the 30th of March, 1763, Frederick returned to his capital, which he had not seen for above six years. Still Frederick was not unwilling again to have recourse to arms. In 1772 Maria Theresa was compelled to consent to the partition of Poland. The share of Prussia, though inferior in extent and population to that of the other two parties, was of immense importance, as it connected the province of East Prussia with the king's German dominions, and, by giving him possession of the mouth of the Vistula, rendered the trade of Poland tributary to him.

In 1779 Frederick again set his army in motion to prevent Bavaria from being swallowed up by Austria. The campaign was short, but it was not in vain.

Frederick died in 1781. With regard to his personal appearance, Dr. Moore, who saw him in his old age, says: "He was below the middle size, well made, and remarkably active. There was spirit and determination in his look. He had fine blue eyes and an agreeable countenance. He had a slight stoop, and his head was a little on one side—as was the case with Alexander the Great, as all children know well. He was fond of snuff, of lively repartees, of music, and of the company of philosophers, though he might have had a better companion than Voltaire. Frederick made Prussia great. He made himself a name. For years all England admired him. Still he would have done better had he been less fond of war, and more of a philosopher."

MOTHS.

The butterflies, of some of the principal forms of which, and of their transformations, we gave a short account in a recent article, furnish a very excellent illustration of the order of insects to which they belong. These insects are called *Lepidoptera*, or scaly-winged insects, from one of their leading characteristics, the possession of four filmy wings, thickly covered with minute scales, to which the beautiful colouring of the butterfly's wing is due. This, however, is not the only common character by which these creatures are at once united amongst themselves and distinguished from other insects: the great completeness of the metamorphosis which they undergo, from a crawling caterpillar to a creature whose life is spent almost entirely on the wing, with an intervening state of perfect repose, is another distinction, which, although by no means peculiar to the *Lepidoptera*, yet serves to separate them from several other orders of insects, in which the difference between the form of the creature on emerging from the egg and that which it is destined to acquire is much less. A more important character than the scaly covering of the wings is presented by the peculiar structure of the mouth, which in these insects consists of a long tongue rolled up in a spiral form between a pair of hairy organs, called *palpi* or feelers. Different as these delicate organs appear, at first sight, from the powerful jaws by which the caterpillar gnaws his destructive path through the produce of the garden and the field, the same parts, modified indeed in form, may yet be recognised in the perfect insect that existed in its crawling, worm-like, preparatory state. The strong biting jaws have become very small, although in most cases they are to be found concealed under the other organs of the mouth. But the second pair of jaws, with which the caterpillar masticates his food, have undergone a wonderful transformation—it is from these that the long spiral trunk has been formed. These, in the perfect insect, as in the caterpillar, are jointed organs; but in the former the terminal portion of each is drawn out into a long filament, furnished on its inner surface with two narrow ridges, which fitting exactly to those of the other filament, form by their union a long slender tube, piercing the trunk through its entire length. The lower lip of the caterpillar also shares in the changes undergone by all the neighbouring organs. In the preparatory state it is furnished with a pair of minute feelers and with a fine tube, the orifice of the silk apparatus, by means of which the creature, when ready to pass into the chrysalis condition, attaches itself to some point of support, or encloses itself in a silken bag, in obedience to the instincts implanted in it by nature. This tube, being of course useless to the insect in its last condition, is then no longer to be found; but the little *palpi* or feelers acquire an enormous development, and form the hairy bed in which the trunk is nearly concealed when coiled up in repose. The antennæ, also, which in the caterpillar are very small, are converted in the perfect insect into long organs of very various forms; and the organs of vision, instead of consisting of a few little black points on each side of the head, are developed into those beautiful globular structures which may be seen to constitute the great bulk of the head in any of our common butterflies.

The most striking general difference between the two great groups of *Lepidoptera*, butterflies and moths, is to be found in the form of the antennæ, which in the former are always clubbed at the tip, whilst in the latter they are thread-shaped or tapering, or sometimes thickened towards the end, but afterwards tapering to a fine point. Another distinction, which is of still more importance in a scientific point of view, is that, in the moths, the wings of each side are united during flight by a small bristle attached to the anterior margin of the hind wing, which passes through a little loop formed on the hinder margin of the forewing; this arrangement is wanting in the butterflies.

In the sphinxes, which from their great power of flight are generally known by the name of *Hawk-moths*, the antennæ are always thickened beyond the middle, but taper afterwards to a fine point. Some of these have trunks of great length, by means of which they extract the nectar of flowers, whilst hovering over them in the manner of a humming-bird. From this habit, and its size and general bird-like appearance when on the wing, one of the commonest of our native sphinxes has received the name of the Humming-bird Hawk-moth (*Macroglossa stellatarum*). A nearly-allied and very beautiful species is represented in the accompanying woodcut (fig. 1). This is the Drone-bee Hawk-moth (*Macroglossa fuciformis*), an insect only occasionally found in this country, but which appears to be common on the continent. The general colour of the body is a bright olive green, yellowish at the hinder extremity, where there is also a black tuft of hair on each side; across the middle of the body there is a dark brown band; the wings are transparent with a dark brown border, and the anterior pair have an olive-green patch close to the body. In the Humming-bird Hawk-moth, the wings are covered with scales throughout, but in form and habits the two insects very closely agree.

In the Death's-head moth (*Acherontia atropos*, fig. 2), which also belongs to the group of Hawk-moths, the trunk, instead of being very long, as in the preceding insects, is reduced to comparatively small dimensions, being scarcely longer than the head of the moth, whilst in the Humming-bird Hawk-moth it exceeds the whole body in length. The Death's-head moth is the largest of European moths, measuring sometimes upwards of five inches in expanse of wing; its general colour is a blackish-brown; the fore-wings are irregularly clouded with dull orange, and have a white spot near their middle; the hinder wings are dull orange with two brown bands. The body is banded with orange and black, and the appearance of the insect is rendered exceedingly remarkable by the very singular marking of the thorax. This bears a large dull orange patch, within which are smaller blackish spots, producing on the whole a by no means indistinct representation of the popular "death's head." This peculiar mark, coupled with the generally funereal character of the coloration of the insect, has on some occasions obtained for it an unenviable position in the popular mind, as its appearance in larger numbers than usual has been regarded, in some places, as portentous of an approaching pestilence. Singularly enough, in the year 1733, it appeared in great numbers in Brittany, simultaneously with a very fatal epidemic disease; and so completely did the weaker and more ignorant of the country people consider the insect as the cause of the distemper, that the sight of one was sufficient to produce the greatest fear in the beholder, who regarded it as the messenger of approaching death. The Death's-head moth possesses another curious faculty, which no doubt conspired with the symbols of death with which it is ornamented to raise a feeling of superstitious dread in the minds of those whose attention was called to it for the first time; when irritated or handled, it emits a little plaintive cry or squeak. This circumstance has long been known, but although several eminent naturalists have endeavoured to explain the mode in which the sound is produced, they do not yet appear to have arrived at any satisfactory conclusion on the subject. The faculty of emitting a sound is probably connected with a singular habit of this insect, which renders its multiplication in unusual numbers an object of real and well-founded dread to keepers of bees. The moth has a most gluttonous taste for honey, and is one of the most inveterate plunderers of bee-hives. The bees, on its entrance into their domicile, generally disperse immediately, as though in dread of the gigantic intruder, who is thus left to surfeit himself at his ease upon the sweet stores which these industrious creatures had laid up for their winter store. "It is singular," says Mr. Westwood in speaking of this circumstance, "that a creature, with only the advantage of size, should dare, without sting or shield, singly, to attack in their stronghold these well-armed and numerous people;

and still more singular, that amongst so many thousands of bees, it should always contend victoriously." It has been supposed that the thick fur with which the moth is covered prevents the stings of the bees from reaching its body, but it seems far more probable that it employs its power of emitting a sound, and perhaps some other means, to spread terror amongst the ranks of its assailants. The caterpillar of this moth is, as might be expected, of great size, measuring sometimes as many as four inches and a half in length, and two-thirds of an inch in thickness. Like all the other caterpillars of the Hawk-moths, it has a longish horn attached to the back of the eleventh segment. It has also, in common with most of its near allies, the habit of raising the anterior segments of the body, supporting itself by adhering to the branch on which it rests by the membranous feet of the hinder segments. In this attitude these caterpillars present to a fanciful mind a slight resemblance to the sphinx of the Egyptians, and this induced Linnæus to apply the generic name of *Sphinx* to the whole of these moths. The caterpillar of the Death's-head moth lives principally upon the potato, and the chrysales are frequently turned up in digging up potatoes in autumn. The moth generally appears in October, but rarely flies by day.

Another very beautiful species of hawk-moth, very common in this country, is the Lime Hawk-moth (*Smerinthus Tiliæ*, fig. 3), so called from its caterpillar feeding principally upon the common lime-trees. This moth has the fore wings much notched at the tip; it varies greatly in colour, but in the variety most generally met with the wings are of a fawn colour, with a broad band at the tip, and two spots, about the middle of the fore wings, olive-green. In this moth the trunk is even shorter than in the Death's-head moth.

The antennæ in the hawk-moths are generally more or less toothed like a comb on the inner surface; but this character is by no means so striking in them as in some other moths, in which the antennæ, at all events of the males, are toothed or pectinated on both sides; the little filaments forming the combs being frequently of such a length as to give the entire antennæ the appearance of a delicate feather. An instance of this is presented by the male of the insect here figured, the Gipsy moth (*Hypogymna dispar*, fig. 4), which occurs not uncommonly in some localities in England. In appearance the two sexes of this moth differ considerably from each other; the male is much smaller than the female, and is of a grayish colour, with some blackish lines and spots on the fore wings, whilst the female is white with dusky lines, describing much the same pattern as in the male. The caterpillar feeds on fruit-trees. A very common and beautiful British insect, nearly allied to this, is the great Tiger moth (*Arctia caja*), which is produced from the large hairy bear-like caterpillars, often seen feeding upon nettles and other hedge-side plants

FIG. 1.—THE DRONE-BEE HAWK MOTH (MACROGLOSSA FUCIFORMIS).

FIG. 3.—THE LIME HAWK MOTH (SMERINTHUS TILIÆ).

FIG. 2.—THE DEATH'S-HEAD MOTH (ACHERONTIA ATROPOS).

The *Chelonia pudica*, (fig. 5) is another very beautiful species, nearly allied to the two preceding. The ground colour of the wings is a pinkish white, the hinder wings, especially in the female, being of a delicate pink colour. The fore wings are nearly covered with a number of black spots, and the hind wings have two or three similar spots of variable size. The body is spotted or banded with rose colour and black.

FIG. 4.—THE GIPSY MOTH (HYPOGYMNA DISPAR)

FIG. 5.—CHELONIA PUDICA.

FIG. 6.—THE LAPPET MOTH (GASTROPACHA QUERCIFOLIA).

The feathered structure of the antennæ is also observable in the male of the Lappet moth (*Gastropacha quercifolia*, fig. 6), the caterpillar of which feeds on various trees. This and some allied species of moths have received from collectors the name of Lappet moths, on account of the curious fleshy appendages attached to the sides of the body of the caterpillar and which completely conceal the feet. These caterpillars

FIG. 7.—NEST OF PROCESSIONARY CATERPILLARS (CNETHOCAMPA PROCESSIONEA).

FIG. 8.—FIDONIA PLUMISTARIA.

are very hairy, and when handled the hairs penetrate the skin and produce considerable inflammation and itching. The moths are also called *Eggers*, from the chrysalis being enclosed in a very smooth, fine, egg-like cocoon. The Lappet moth (*Gastropacha quercifolia*), represented in the annexed cut, is rendered further remarkable by the curious position assumed by the hinder wings during repose; these, instead of being concealed by the upper wings, as is the case in other moths, project on each side in the form of rounded notched leaves, giving the creature a very singular appearance. The general colour of the insect is a deep reddish brown, marked with blackish lines. The silk-worm, with the manufactured produce of whose beautiful cocoon we are all familiar, is the caterpillar of a moth (*Bombyx Mori*) belonging to the same group as the Lappet moth; and many of our common moths also weave cocoons in which to pass their season of repose in the chrysalis state. But the most singular application of this power of silk-spinning is exhibited in the history of some moths, also nearly allied to the preceding, whose caterpillars live together in numerous societies, retiring, after feeding, to a capacious nest of tolerably firm texture, woven by themselves from the materials afforded by their own bodies. Some of these, as the Processionary caterpillar (*Cnethocampa processionea*, fig. 7), quit their nest, which is generally attached to oak-trees, in a regular and well-ordered procession; one caterpillar takes the lead, and is followed by others in single file generally for a space of about two feet; they then come in pairs for a time, then three, four, and five abreast, and so on, until they sometimes march ten or even twenty in a row. All the movements of the leader are faithfully copied by those who follow.

Another species, the Pine processionary (*Cnethocampa pityocampa*), attaches its nest to pine-trees, and both these insects have been said to occur in Britain, although upon very doubtful authority. The principal enemy of these moths is the larva of a large and very voracious beetle, the *Calosoma sycophanta*, which breaks into their nests and commits vast havoc upon the defenceless inhabitants; one of these savages is represented in our cut, just seizing his prey in the interior of a nest, which is supposed to be torn open. Occasionally, however, the tyrant pays dearly for his feast; for when gorged, he is no match for more active and hungry members of his own species, who, disappointed perhaps by the vacant nest of their expected prey, feel no scruples about taking it at second-hand by an act of cannibalism. Nearly allied to these, and especially to the silk-worm moth, is the gigantic Atlas moth (*Saturnia Atlas*), which inhabits the East Indies and China. This moth measures between eight and nine inches in expanse of wing; and other species nearly as large are found in several tropical countries. Many of these insects—some of which furnish a silk which is used in manufactures—have singular transparent spots in the centre of the wings, looking as though pieces had been cut out and replaced by fragments of talc.

Of the remaining groups of moths our space will not allow us to say much, and we shall only refer to one of the most interesting and numerous of them—the family of *Geometers*, the caterpillars of which are known to collectors by the name of *Loopers*. This name, as well as the scientific one (*Geometræ*), is derived from the singular mode of locomotion adopted by the caterpillars. These, possessing only a single pair (and that the hindmost) of the membranous feet on which other caterpillars support the greater part of the body, are unable to crawl like their more fortunate brethren; accordingly, in walking, they stretch the body out to its full length, when they attach themselves by the anterior feet, and then, drawing up the body in the form of a loop, bring the hinder feet close up to the others, attach them, and repeat the process until they have attained their desired position. Hence they appear to be constantly measuring the distance over which they travel; and from this circumstance the name of geometric caterpillars has long been applied to them. They have also a singular habit of adhering to a branch by their hinder feet, and stretching out the rest of the body in such a manner as to present a very close resemblance to a dead twig: and thus, no doubt, they often elude the vigilance of their enemies. The moths produced from these caterpillars, one of which is represented in the annexed engraving (fig. 8), are of a much slighter make than those already described; their bodies are slender, their wings soft and weak, and their flight irregular and fluttering. They are mostly truly nocturnal insects, very few of them being ever seen in the day-time. Space, unfortunately, forbids our entering upon the history of the vast numbers of smaller moths which form the concluding groups of the *Lepidoptera;* but their economy presents much to attract the attention even of the most careless observer; and the singular habits of the leaf-rolling and leaf-mining caterpillars will afford a never-failing source of interest to any one who will take the trouble to study them.

AMERICAN SCENERY—SAVAGE AND CLASSIC.

There is, if we do not dream, something more than poetry in the prophecy of the hills and rivers. There is an educational power in the substantial forms of a country, far surpassing that of the finest sculpture. It is only the Peter Bells that see hills and woods and rivers in our earthly patrimony, and no more. Of only such a one can we say—

> "A primrose by the river's brim
> A yellow primrose was to him,
> And it was nothing more."

We are free to confess that the scenery of a country is nothing less in our estimation than the furniture of man's temple home. Instead of being the circumstances, or conditions, or even the complements of the national character, it forms at once its elements and model. No people has ever been so creative and independent as to rise above its suggestions and studies. Scenery has an intellectual import and mission. It is a grand and harmonious assemblage of substantial symbols, through which the Almighty instructs men, and the imagery of which forms all that is grand, beautiful, and permanent, in the languages, traditions, and literature of the world. The mountains have been the nurseries of religious myths and liberty: the sources of rivers have fostered the gratitude of natural piety in all ages.

The free influences of nature have not waited for the tardy awakenings and recognition of the soul. They antedated consciousness and all human education. They came to the cradle, they floated about our homes, and bathed the awaking heart in mystery and sweetness; and when we were able to walk alone against the winds, and drink in the wonder and the joy that live in the face of inanimate things, they aided us in giving birth to the beauty and grandeur of human conception. They became part of our being. Nature, we feel, has a varied language, which is admirably indicated by Sydney Smith.

"I, for one," says he, "strongly believe in the affirmative of the question, that nature speaks to the mind of man immediately in beautiful and sublime language; that she astonishes him with magnitude, appals him with darkness, cheers him with splendour, soothes him with harmony, captivates him with emotion, enchants him with form; she never intended man should walk among her flowers, and her fields, and her streams, unmoved; nor did she rear the strength of the hills in vain, or mean that we should look with a stupid heart on the wild glory of the torrent, bursting from the darkness of the forest and dashing over the crumbling rock. I would as soon deny hardness or softness, or figure, to be qualities of matter, as I would deny beauty or sublimity to belong to its qualities." This is a truthful utterance of a great man—one that is to have a meaning beyond the graphic indications of the words by which it is known, in the experience of the American people.

The influences and instructions of nature, the lessons of her

scenery, as thus viewed, are far superior to art. Her schools are more charming and effective than those of the state. Her galleries of the picturesque far transcend, in all the elements and combinations of beauty and power, those of the nations. Like the approach of spring, so happily sung by Schiller, she forbids all familiarity, preserving a sacredness and dignity, while she teaches, caresses, and bestows gifts upon all classes of men—the sullen and gloomy Indian as well as the delighted white man. The secret of all this is strangely overlooked. We speak of mind as being the most powerful agent to influence mind, and wonder how it is that we feel on the top of a mountain such lofty emotions. We forget or strangely overlook the fact, that the Infinite is influencing us in natural scenery, and, in the presence of mountains and lakes and rivers, lending, through the sense of the Infinite, something of His own grandeur to the soul.

Instances that illustrate and confirm what we have said cannot be wanting to any well-informed mind. The character and literature of the Goths, their history and religion, are imbued with the spirit of northern regions—storms, mists, and the dread ocean mingle in all. The Greeks found the elements of their civilisation in their native valleys and on their native hills. The climate that hung upon Olympus and Pelion, and shaded the groves of Academus, yielded to their minds the clear medium through which they pictured oreades on the distant hills and created gods out of remembered heroes. Their philosophy and poetry both partook of the sharpness and distinctness of their scenery, its variety and lovely magnificence. As seen from the Parthenon, it is the physical counterpart of all that Greece has been. "There is no mixture of light and shade, no half-concealing, half-revealing, as in the symbolical cathedrals of the Christian faith. There are no rays of divine darkness, running along the side of the rays of light, and sinking into the ground beneath, the altar of the East. All is open to the unbounded blue ether above, and the vertical rays of a noon-day sun, and the trembling visitations of the unimpeded moon-beams—a very house of light, unstained by painted glass, undarkened by vaulted roofs, unintercepted by columns and arcades, and with the instantaneous perception, unmarred by the cruciform shape." Here is the source of the Hellenic religion and song as known to us. If any additional evidence were wanted to illustrate or confirm the influence of national scenery upon national character, it is furnished in the language, traditions, and character of the American Indians, in which aged forests have left their impressions as manifestly as in the colour and temper of the red-man. Evidences may be gathered up on every hand. The Atlantic slope, the snowy cotton-fields of the South, and the grand West, have given their distinctive features to the American people; each division has its own type of character.

A few instances of the influence of scenery in the formation of individual character will bring the subject more immediately within the reach of all. Artists, poets, and philosophers, have freely acknowledged it; and, indeed, if they should be so ungrateful to the Creator as to deny it, all that we should have to do, to brand them as the ungrateful guests of the Almighty, would be to reclaim the imagery and the thoughts they borrowed from the earth. "There is," says Beerus, "scarcely any earthly object gives me more—I do not know how I should call it *pleasure*—but something which exalts me, something which enraptures me—than to walk in the sheltered side of the wood, or high plantation, in a cloudy winter day, and hear the stormy wind howling among the trees and roaring over the plain. It is my best season for devotion." Solger, long accustomed to inland scenes, gives us a fine illustration of the influence of scenery on the mind, in speaking of his first sight of the sea. "Here," says he, "for the first time, I felt the impression of the illimitable, as produced by an object of sense, in its full majesty." The works and characters of Humboldt and Audubon are rich in such illustrations. Goethe, whose whole character and writings wear an inland impress, and seldom, if ever, afford an instance of a well-defined sense of the infinite, was conscious of the formative power of scenery and its distinctive influence. "Perhaps," says he, "it is the sight of the sea from youth upwards, that gives English and Spanish poets an ascendancy over those of inland countries."

Musing on the influence of physical scenery in the formation of national and individual character, we find ourselves looking out over the New World. The savage and classic scenery of America, and especially that of the United States, awaken mingled emotions in our minds. They have a goodly heritage; but few, if we except artists and poets and moralists, are prepared to acknowledge it in its scenic aspect, and lend themselves to its cultivation. The division of labour, the multiplication of inventive skill, and the isolation of men in the absorbing pursuit of one idea or one aim, abandon it to neglect, or, worse still, subject it to the despotism of their utility. Business is engrossing, and daily commits wholesale robberies on the hearts and homes of men. Railroads are marring the picturesque, and mills are drying up their cascades and cataracts. The falls of Paterson are nearly effaced. Even Niagara has been threatened in their daring progress. The terror of his power alone guards his majestic reign.

But what is American scenery? The fact that it is destined to play an important part in the history of that people, and, by the constitution of things, must lend its forms and meaning to their thoughts, invests it with an enduring interest. The historian who forgets this, and stops at the landing of the Pilgrims, the Saybrook Platform, or even the landing of Columbus, as their first historic antecedent, stops short of one of the grandest in their history and character, the physical scenery of America. The character of New England is greatly indebted to New England soil. This is pre-eminently true of the West. Its recognition by statesmen and educators would be a new compromise, and form one of the finest conservative elements in the unity of the country; its improvement by government would be a national benefaction, far surpassing the favours conferred on certain localities by special grants. They need some measure by which the savage and classic scenes of their country shall appear in a national gallery, and be preserved as the true archives of the nation—divine archives.

We return to the question—*What is American scenery?* Its diurnal and seasonal dress wins attention. The howl of winds in the clear winter-sky, the magic verdure of spring, the glowing heats of unclouded summer weather, and the play of dissolving autumn tints in its dreamy haze, as they succeed each other and crown the varied year, give to the broad and bold land-and-water features of the country an unusual richness in picturesque effect.

In such a contemplation, we feel that there is little in the name American. It has not for the people, as Anglo-Saxons, even a historic antecedent. The name is little; the significance of the thing is all. It is unquestionably a grand national inheritance. American scenery is a bold and varied language of substantial forms; and in order to understand it and translate it into the speech of man, it is necessary to examine its structure, distinctive objects, and their disposition in the local landscape and national territory.

American scenery is not the complement of Asia and Europe, but the excellence of both. Its composition is a simple but grand arrangement of the distinctive features of the Old World. The scenery of Asia, like the vast outline of that almost unbroken mass of the earth, presents a massive but little varied unity. Europe, on the other hand, exhibits an endless variety. Europe, by this characteristic, as seen in its contour and relief, performed a noble part in the diverse development of the human race. American scenery repeats the distinctive features of both, and in happy accordance. The structure of the continent is eminently simple, but imposing; its contours and reliefs are favourable to the most extended enterprise, and the disposition of its parts such as secures the union of beauty and utility in an unusual degree. Fertility allies itself to natural loveliness: the farmer plants and reaps in companionship of a friendly grandeur.

The distinctive features of American scenery, as a whole, are,

DELAWARE WATER-GAP. A RIVER SCENE.

in our opinion, the unity of its variety, and the variety of its unity. None of those elements, so necessary to the idea of excellence, is permitted to reach an extreme. This feature, so peculiarly North American, forces upon us the not unnatural thought, that the country is admirably adapted to become the home of a people whose civilisation is to be

PRAIRIE NEAR THE ARKANSAS RIVER.

ESOPUS CREEK.

distinguished by its care of the individual, and the restoration of liberty and union to the human family. Here it is necessary to take into consideration the vastness of the scale on which this feature is exhibited—a scale extending from the Atlantic slope to the sea-board of the Pacific; and in all its range—whether we consider the northern chain of lakes, the mountain ranges, the wonderful scenery of the Potomac, the head-waters of the Mississippi, the peninsula of California, the far-reaching region extending between the Rocky Mountains and the Pacific, or the wonders that line the banks of the far-off Columbia and the Willammate, wandering for hundreds of miles through an unsubdued but fertile wilderness—it presents a singular unity and variety of all that is necessary to constitute the territory of the greatest of nations.

But it is not the contemplation of the whole that benefits the soul by awakening a well-defined admiration, so much as the nearer study of its distinctive parts. The lakes, rivers, mountains, forests, and prairies of North America are the theme of an ever-renewing wonder.

The American lakes are generally regarded as one of the distinctive features of that country. Their magnitude is such as excites the astonishment of Europeans. They lie along the northern frontier like a chain of inland seas. They spread out their waters on the bosom of the middle states, deep and broad enough for contending armaments. Their magnitude, however imposing, is by no means their most effective feature. Their haunts are more impressive to the mind—the mountain and forest scenery in which they echo to the voice of stormy winds, or, burnished by the unmitigated summer-noon, gleam like silver plains through the umbrageous forests that encircle them. Schroon lake, dear to the fine arts, lies embosomed in wild and picturesque haunts. The bases of the Adirondacks are beautified by lakes, quiet and lovely in their leafy solitude. Lake George is a household word of picturesque beauty. Its bold and jutting shores, rampart hills, pure waters, garniture of islands rising like emeralds on its breast, and its bold relief in an atmosphere singularly subject to change and the agitations of violent storms, furnish us with a true picture of loveliness and its antithesis.

American rivers exist in harmony with her lakes. Some of them are vast; others are beautiful; all, with few exceptions, picturesque. They flow for the most part through the fulness of forest scenes, and, in many cases, enliven the almost oppressive terror of mountain gorges by the dash of their waters. Their banks are crowned, in some places, with bluffs, rising occasionally to the magnitude of mountains; in other places they are lined by the waving grass of the far-reaching prairie; and in most places ennobled by wild dispositions of rocks, or the solemn forest. The head-waters of the Mississippi are rich in studies for the artist. The Hudson has already been made glorious in tradition and song and on the canvas. Cooper has spoken of one river as "the mighty Susquehannah, a river to which the Atlantic herself has extended her right arm to welcome into her bosom." Buneau, a tributary of Bear river, runs through a fearful chasm for the distance of some hundred and fifty miles—a chasm more than 2,000 feet deep, and only a part of a country that is little less than an indescribable chaos. The scenery of the main river, in the language of Irving, is truly grand. "At times," says he, "the river was overhung by dark and stupendous rocks, rising like gigantic walls and battlements; these were rent by wide and yawning chasms that seemed to speak of past convulsions of nature. Sometimes the river flowed glossy and smooth, then roaring amid impetuous rapids and foaming cascades. Here rocks were piled up in most fantastic crags and precipices; and in another place they were succeeded by delightful valleys." We add only another instance of river scenery. We only indicate it, and in the language of Jefferson. "The passage of the Potomac through the Blue Ridge is, perhaps, one of the most stupendous scenes in nature."

The river scenery, which we have indicated, although noble and richly diversified, yields, in many points, to the scenery of the creeks. In saying this, it is necessary to add, that the creeks are not European creeks, but rivers in almost any other country than America. The scenery through which they flow, and of which they form the life-like current, are exceedingly varied and pleasing. Now we stop to gaze upon rocky bluffs rising up in front of receding woods, and then ascend an eminence to behold the stream winding through rich valleys and approaching hills. This hour, we are admiring the outline of islands and the pleasing contour of the banks; and the next, looking up the rocks and wood-girt avenue of water to the cascades that sparkle and foam in the distance. As an instance of rich and beautiful creek scenery, we may mention Esopus creek. The accompanying engraving is a view of that creek, and was taken from a study by E. W. Durand, a young artist of great promise, as one who is to give a truthful and vigorous rendering of the lessons of nature.

The mountains of America are, in many respects, the most varied and striking objects in its scenery. They are not, as a whole, so grand in their outline and effect as the mountains of Southern Europe, but they are richer in studies and the details of the picturesque. Their sides are thick in choice recesses, where the artist may find rocks and trees and cascades in imposing dispositions.

The chasms are often terrible, the defiles vast, and the wooded sides always impressive, especially under the influence of an autumn atmosphere. The Cattskill raises its blue height some three thousand feet, full of wild and wonderful scenes. The White Mountains furnish many noble rocky views. The Alleghanies are never monotonous. The Rocky Mountains abound in all the elements of savage scenery. The Adirondacks, with their cone-like peaks, jagged ridges, wooded sides, echoing along which is heard the sound of numerous cascades; and the lakes that repose in wooded solitudes at their bases, form a noble feature in our northern mountain scenery. The Adirondack Pass—a gorge between two mountains, filled with huge rocks surmounted with green trees, and the precipice rising on one of its sides to the height of a thousand feet—is a wild and dreadful scene.

Rocks form a feature in the scenery of America, which the lover of nature and the artist cannot very well overlook. They appear solitary or associated, wild or beautiful in the mantling mass of centuries. We do not speak now so much of the solid pyramidal pile, or the crags that range the upper summits of the mountains, as those that guard the gorges and passes of mountain chains, or lie deep within the woods that clothe their sides. There are almost endless recesses in American mountains, and in these, unseen and untold studies for the artist. The gnarled and knotted roots of the maple, big with age, spread out their folds among huge fragments of the rent peaks, now clothed with lichens or moss in their fall, or washed by the playful cascade fringed with inimitable green. Among our fallen rocks, thus beautified and rendered picturesque, there are innumerable haunts and walks of wisdom. There is another class of rocks which the genius of the people, and especially the Puritan descendants in New England, have ennobled by associations.

The prairies are, perhaps, the most distinctive feature of the scenery. They are altogether unlike the steppes of Russia, dreary and cold; the gloomy brown heaths of Great Britain; and the slanos of South America, ever subject to the dreadful dominion of floods or torrid heat. The grassy, the timbered, and the undulating prairies of the West, are vast desert gardens, where the wild flowers flaunt in gaudiness, and unnumbered animals find a playground.

> "These are the gardens of the desert, these
> The unshorn fields, boundless and beautiful,
> For which the speech of England has no name—
> The prairies. I behold them for the first,
> And my heart swells, while the dilated sight
> Takes in the encircling vastness. Lo! they stretch
> In airy undulations, far away,
> As if the ocean, in his gentlest swell,
> Stood still, with all his rounded billows fixed
> And motionless for ever. Motionless!
> No, they are all unchained again."—*Bryant.*

THE UNCLE'S RETURN FROM ABROAD.

Some years ago, before this country was so thickly interlaced with trunk lines and branch lines of railway running in all directions, there lived in a small village, not far from Liverpool, a farmer's widow named Stedman, who had been visited with heavy misfortune. Her eldest son had been lost in a shipwreck, leaving four younger brothers and sisters to her care. This unhappy event had postponed and apparently broken off the marriage of her daughter Constance, while it had injured the prospects of her son Martin, who was obliged to leave school before his time in order to work on the farm.

But amid the anxiety and depression into which the family were plunged, a ray of hope suddenly burst forth. A letter, written at Liverpool, announced that a brother of Mr. Stedman's, who went abroad twenty years before, had just arrived in that port, with some natural curiosities from India. The letter gave rise to all sorts of conjectures. Though it contained no precise information, Martin thought he detected, in the easy style in which it was worded, undoubted evidence that his uncle had come back with his pocket well-filled and his heart well-disposed towards the family. "Ah," said the widow with a sigh, "if my poor Walter had been alive, he would now have had a valuable friend." Martin was sure he should have no difficulty in obtaining the post of steward to a neighbouring nobleman through the powerful influence of his rich uncle; for the letter said he would be with them the following day with all he possessed, which, as Martin read it, meant that he would take care not to forget them.

Preparations for the arrival of the expected nabob were commenced forthwith, on a scale of unusual liberality. Scarcely were they completed when one of the children, who was on the watch outside, ran in, crying out,

"He is come! he is come!"

"Who?" shouted the rest.

"Uncle Stedman, to be sure," was the answer; and at the same moment a clumsy, uncouth-looking man stood on the threshold, with a green parrot on his left hand, and a sort of monkey fastened to his right.

The little children ran in terror to hide themselves behind their mother, who herself could not help shrieking with alarm. The rest of the family were stupified with astonishment.

"What!" said Stedman, smiling; "are you afraid of my little menagerie? Come, shake hands—you have nothing to fear. Yours is a dusty road, and I have had rather a long walk to find you out."

"You don't mean to say you have walked all the way from Liverpool?" replied Martin. "What have you done with your luggage?"

"Luggage! you don't suppose a man like me goes about with more luggage than he can carry on his back."

"But your letter said you had come to reside permanently among us, with all that you possessed."

"Well, you see all I possess," cried Stedman, "my monkey and my parrot."

"What! is that all?" shouted the whole family.

"With a light heart and a good conscience, I want nothing more. But as I am rather hungry after my walk, and I see you have plenty to eat, I will begin at once, if you please, without any ceremony."

Thereupon he commenced operations with a degree of zest that was anything but gratifying to the widow and her family, who looked at each other in mute astonishment. In the course of conversation, which Martin carried on with his uncle during his hearty meal, the latter stated that he had spent twenty years in India, and had now come home without any other possession than a good temper and a good appetite. The effect of this announcement was immediately visible in the look and manner of every member of the family. One of the little ones having been chased round the room by the mischievous monkey, the mother ordered it to be sent to the stable; and the parrot having ventured on to the table, to pick up what he could get from the dishes, Martin exclaimed that this sort of thing could not be tolerated any longer. Constance and Julia said nothing, but went off out of the room.

The uncle, left alone with Martin who scarcely disguised his sullen disappointment, after emptying his glass for the third or fourth time, stuck his elbows on the table, and looking his nephew quietly in the face, said: "There seems to be a sort of north-east wind in your house. You all look very coldly upon me, and nobody has yet said a kind word. Is this the way you receive an uncle who has been absent for twenty years?"

Martin replied rather sharply, that they had given him the best reception they could with their slender means.

"But at any rate," said his uncle, "you need not have looked quite so sour and behaved so coldly. However, enough upon this disagreeable subject; but mind what I say, you will repent of this by-and-by.

With that he cut another large slice of meat, and began eating again, as though he had not tasted a morsel. Martin was struck with his last remark, which he turned anxiously over in his mind. "My uncle would never," thought he, "have adopted this free-and-easy manner with us, if he really possessed nothing more than this nasty monkey and that screeching parrot. He is only playing a trick to put us to the test. We must immediately try if we cannot retrieve our fault. Full of these thoughts he ran to his mother and sister to communicate his surmise. They both hastened back to the room with smiling looks, and began to pay the uncle all sorts of kind attentions. The latter, gazing attentively upon Constance, who had taken a seat opposite to him, said in a pensive tone: "Ah, how much you are like my poor brother George. This is not my first acquaintance with you. Your name has often been mentioned in my hearing."

"By whom?" replied the astonished girl.

Before her uncle could answer, a voice was heard crying, "Constance!" She turned round in amazement, but saw no one

"Ah! you don't know who it is that is calling you," said her uncle.

"Constance! Constance!" repeated the strange voice.

"It is the parrot!" exclaimed Martin.

"The parrot!" answered his sister; "but who could have taught it my name?"

"Somebody who has not forgotten it," slily rejoined her uncle, at the same time winking his eye in a very knowing way.

"Was it you, uncle?"

"No, my dear; but a young man born in this village."

"What, Mark?"

"I believe that is his name."

"Have you seen him, then, uncle?"

"Yes, I came home in the same vessel with him."

"And he has spoken——"

"Of you," said her uncle, divining her thoughts, "and often enough, as you see, for the parrot to remember your name."

Constance blushed with delight, and her mother could not conceal her satisfaction, for she had always favoured the proposed match between Mark and her daughter. They were still more gratified when they heard that the young lover was only detained at Liverpool by necessary formalities, and would, in all probability, be with them the next day. Constance could no longer restrain herself; she flew to her uncle's arms in a transport of joy.

"Well, now we are friends, I suppose," said he, smiling. "That you may not be tired of waiting for your beau, I will give you my parrot, which will talk to you about him."

She again kissed her uncle with a thousand thanks, and took the bird, which jumped upon her shoulder and said plainly: "How do you do, Constance?"

The whole family roared with merry laughter.

"You have made one happy, at any rate," said the widow.

"I should be glad to do the same for you," replied her brother-in-law, in a serious tone; "but I am afraid of awakening a painful recollection in your mind."

"You mean with regard to my son Walter," said she, with all a mother's promptitude and fondness.

"I do," he rejoined. "When he was shipwrecked, we were unfortunately separated. If we had happened to have been on board the same vessel, who knows but I might have saved him again, as I did once before?"

"It is true, you did once save him. I ought never to have forgotten it."

"Never mind about that; it was no more than my duty. But this time it was impossible to repeat the service. When our ship came up, Walter's had been wrecked a fortnight. All I was able to do for him was to find out where he was buried, and erect a frail memorial over his grave. I managed, however, to find out where his watch was; and here it is for your acceptance."

With these words he offered her a handsome silver watch,

"No," was the reply, "certainly not. I have brought him up and kept him ever since he was born. He is my servant and companion wherever I go. I would not sell him for ten times his value. But who wants to buy him?"

"A nobleman's son, who was passing just now, saw the animal, and was so pleased with it that he desired me to purchase it, and take it to him."

"Tell him I won't part with it for any money."

"But consider, uncle, what disappointment you are causing by this refusal. The nobleman has promised to make me his steward, and I should be very sorry to disoblige his son."

"Yes, indeed," said his mother; "if Martin can only obtain that situation, he is made for life."

"Then take him, and welcome; only be sure and say I hope they will use him well."

THE UNCLE'S RETURN FROM ABROAD.

which she seized with passionate eagerness, and kissed again and again. All the female members of the family wept. Martin himself was deeply moved, and his uncle was obliged to cough in order to conceal his emotion. The coldness and restraint which was before exhibited, completely melted away. He assured them he had come back as poor as he went out, and that, in telling his nephew they would one day repent of their coolness, he merely meant they would regret having unkindly treated a good-natured relative. Yet both mother and daughter continued to lavish upon him those attentions which they had previously paid from mere motives of interest. Just as he was about to bid them adieu, Martin, who had gone out for a minute or two, came back and asked him whether he would sell his monkey.

Martin ran off with his prize, and presented it to the young lord, who prevailed upon his father to make the appointment of which he had long spoken. The joy of the whole family, on hearing this intelligence, may be easily conceived. To atone for her fault, the widow candidly confessed the interested views by which she had been influenced when she first received her brother-in-law's letter. He laughed outright at the joke of their expecting so much from him, when he had brought only two useless animals.

"You are mistaken," said Constance, mildly; "you have brought three invaluable treasures; for, thanks to you, my mother has now a memento of her lost son, my brother has a good situation, and I," she added, hesitating and blushing, "I have—hope."

THE MOSQUE OF SANTA SOPHIA.

One of the most celebrated buildings in the Turkish capital is the Mosque of St. Sophia. Everybody there goes to see it. Some are stricken with astonishment, and come away deeply impressed with the grandeur of the whole design, and the solemnity of the venerable place; some are disappointed—they have thought it greater and grander than it really is, have pictured to themselves a realisation of old Arabian stories, a building that seemed as if it had been erected at the spell of the wonderful lamp—and the reality being surpassed by the ideal, they come away to grumble, and to jest at white-washed walls and Moorish carpets. But whatever may be the result of the visit, the visit is sure to be made. St. Sophia's Mosque is the lion of the place, and really well deserves its proud position.

THE MOSQUE OF SANTA SOPHIA.

The original structure was built by the Greeks, and is the largest and most magnificent church ever erected by them. After the emperor Constantine had seen the blazing cross in the air, had shaken off his paganism, and adopted the creed of Christians, and had found that by the cross he conquered, he determined to build at the capital, which had been christened with his name, a splendid structure in honour of the new faith. So he erected a basilica, and dedicated it to the wisdom of God. After this, one or two emperors added to the edifice; but it fell into bad repair, as it was not properly cared for. When the Arians, in a riot about Chrysostom, set it on fire, it was suffered to remain in ruins, and even after Theodosius had begun to see to its restoration, the work again fell into neglect. There was more sedition, and another fire, and then came the terrible event of the circus, in which about thirty or forty thousand people perished.

The erection of a really splendid building—a building such as Constantine intended, Constantius contemplated, and Theodosius dreamt of—was reserved for the emperor Justinian, who determined, so say the chroniclers, to "erect the most magnificent monument that had been raised since the creation." East and west, north and south, the emperor looked for help. Every country was to be put under tribute; every land was to send some decoration; the emperor would search the world for its treasures and have but one altar for the offering. The church of St. Sophia was to rival Solomon's temple; the satraps of Asia and the governors of provinces were to make careful search for marble for columns, and sculptures of every kind which might prove useful in the new building. "Art," says Mr. Christie in his paper on Mosaic work—to which we are indebted for some of these particulars—"was then at a low ebb; they had lost the art of design; they were obliged to steal their brooms ready made; and soon the spoils of temples, baths, and porticoes, which ornamented the Asian and European continents, and even isles in the sea, poured into Byzantium." Ephesus sent the spoils of her beautiful temple of Diana; Baalbec surrendered the glories of its Sun temple; heathen magnificence poured out its treasures before the Christian temple; and along with the trophies of ancient art came workmen from all parts of the world, ten or twelve

thousand men were engaged, and two Greek architects set to work to build the last great wonder of the world—more marvellous than an Egyptian labyrinth, durable as Pharaoh's pyramids, gigantic as the walls of Babylon—more sacred than the tomb of Mausolus or the Jupiter Olympus, and more astonishing than the brazen Apollo—the colossus of Rhodes. It was said, an angel had communicated to the emperor the exact size of the building, had given him an actual, tangible, mathematical ground-plan; so he devoted himself to the work with great earnestness, pressed on the labour with becoming expedition, had a gallery especially erected, from which he might behold the busy scene at his ease. But not content with this, he took an active part in the erection. Peter the Great worked bravely in our dockyards—a timber for a throne, an adze for a sceptre—and in this Justinian somewhat resembled him. His royal hands were busy with the rest; his body clothed in a linen tunic, with a napkin round his head.

When the foundation had been cleared, there was a high and solemn feast. Thousands and tens of thousands of people assembled. The patriarch invoked a solemn blessing on the work, and the emperor put the first mortar to the stone, and so the work began.

There was to be a splendid dome, the final achievement of all architectural glory. It was to surpass everything that ever had been seen, to be for ever the one unapproachable model of all excellence; the admiration of the world was to be aroused, perhaps envy—but impotent envy—that might hope in vain to equal or approach this high triumph of art. How carefully every brick was to be made! how watchful were the emperor's confidants to be that nothing was omitted in their manufacture which could in any possibility contribute to their durability and beauty! This was why Troiloes, Bazilius, and Coleoquintus started for Rhodes to superintend the brickmaking. Every brick bore this inscription:—"It is founded by God; God will give help." Between every layer of bricks sacred relics were placed; and at intervals the workmen ceased their labours, and prayer and praise were offered. All this went on for a long time; no expense was spared, enormous sums were spent, barbarians were spoiled, coffers were emptied, taxes vexatiously increased, salaries omitted to be paid, lands and houses sold, property seized, even the leaden pipes of the city fountains melted down. Money must be had, and there was a woeful want of it. Tertullian, with respect to the prodigality of dress, says:—"A great estate is drawn out of a little pocket; a weak, slender neck can make shift to carry about whole woods and lordships; vast sums of money, borrowed of the banker, and noted in his account-book, to be repaid every month with interest, are weighed at the beam of a thin slender ear; so great is the strength of pride and ambition, that even the weak feeble body of one woman shall be able to carry the weight and substance of so many pounds taken up at usury." Something like this was the condition of the church of St. Sophia. The lamps that swung in the church, with their delicate golden chains, and the elaborate ornamentation of the six thousand candelabra of purest gold, all represented so much shameful pillage, so much fair land pledged, so many woods and palaces sold out and out. Every lavish expenditure was prodigally flung around the building, and £200,000 were paid before the walls were a yard high.

After sixteen years the Basilica was finished. It was a high day in Byzantium. After the fashion of the "good piece of flesh," 2,000 oxen, 10,000 sheep, 600 deer, 1,000 pigs, 10,000 hens, 10,000 chickens, with 30,000 measures of wheat, were distributed to the people. In great pomp the emperor rode on his car of state to the Hippodrome, and then marched to the temple. As he drew near, the doors were thrown back, and as the long magnificent vista met his gaze, the walls and roof covered with gold and mosaics, and so many lamps and candelabra that the place seemed one vast sea of fire, he cried out: "Glory to God, who has thought me worthy of this work! I have conquered thee, O Solomon!"

As a specimen of the magnificence of the place, it may be mentioned that the holy table, or communion table, was, by the emperor's order, made of something which they esteemed more precious than gold. It was a mixture made of pearls and diamonds, of gold and silver, of tin and copper, all of which were melted together. Cedrenus says, the altar was made of gold and silver and every sort of precious stone, of wood, of metal—in fact, of everything that could be produced by sea or land, and every material that the universe could furnish. The ground on which it rested was laid with plates of gold, and the table itself was supported by four golden columns. Forty large columns—a mysterious number, says Von Hammer (hence "The *Forty* Thieves")—separated the nave on the south and north from the aisles. The pulpit was of precious marble covered with gold and jewels.

When the Turks—so goes the legend—took possession of Constantinople, and the old streets of Byzantium echoed to the cry, "God is God!" the Sultan Mahomet II. entered the church of Santa Sophia on horseback. The Christians were at worship, a priest was celebrating mass, surrounded by deacons and acolytes, when the pavements of the church rang to the hoofs of the horse, and the Turk with his broad scimitar dashed into the holy place. The Christians, panic-stricken, fled, and the priest escaped by a door in one of the galleries; as he disappeared, there was a noise like thunder, and the door was supernaturally closed by a stone wall. The Turks add, when the Christians retake Constantinople, this gate will re-open of itself, and the priest will appear to finish his mass.

The modern condition of the building, although remarkable in general effect for beauty, is marred and spoiled by latter-day inventions. The beautiful marble pavement is concealed under immense carpets; the mosaics which decorated the walls are pitilessly whitewashed once in two years; a beautiful figure on the cupola is taken away, and a verse from the Koran put in its stead—"God is the light of heaven and earth." While the inside of the church has undergone these alterations, the exterior has been strengthened with enormous buttresses and piers. A crescent surmounts the cupola. In the mosque is the superb tomb of the emperor Constantine, for which the Turks have the highest veneration. The dome of the mosque is 113 feet in diameter, and is built in arches sustained by pillars of marble.

The mosques are the principal curiosities of Constantinople, and that of St Sophia is the principal mosque. Franks are permitted to enter its stately walls on obtaining an order or licence for so doing—not otherwise. The traveller applies to his ambassador, the ambassador delivers the name of the applicant to the diplomatic agent, and a firman is granted, the required sum, varying from three to twelve pounds, has to be paid—this, of course, will be considered sufficient for a party of thirty or five-and-thirty persons—and in company with the deputed official you start for the mosques and the other sights of the city. The mosque of St. Sophia is in the form of a Greek cross. It is about the same length and breadth as St. Paul's Cathedral. The present dome did not form part of the original structure, that having been thrown down one-and-twenty years after its erection. Besides the chief dome there are two others of considerable dimensions, and six smaller ones. The principal dome is of an elliptical form, "much too flat to be externally beautiful, its height not exceeding one-sixth part of the diameter. Twenty-four windows are arranged around it, and it rests upon four strong arches." Four minarets, but each of a different shape, have been added by the Mahommedans. The building has been outwardly so patched and propped up in different ages that it has lost whatever beauty it may have originally possessed, and is now a heavy, unwieldly, and confused-looking mass. It is entered on the west side by a double vestibule about thirty-eight feet in breadth, which communicates with the interior by nine broad doors ornamented with bas-reliefs. The interior is spacious and imposing, not being broken by aisles or choirs—the building is said to contain 170 columns of marble, granite, *verd antique, etc.*"

The mosque of the Sultan Achmet, and that of Solyman the Magnificent, are preferred by many travellers to the mosque of St. Sophia. Many of the mosques, like the latter, have formerly been Greek churches. Their incomes are very large.

THE MOLDAVIAN HELEN.

The poet very properly asks, "What laid old Troy in ruins?" To this question but one answer can be given—a woman did it all. What mischief has the sex not done in its time! To please a woman Alexander set fire to his capitol, and Anthony made war with the conqueror of the world. To avenge the wrongs of a woman, monarchy was abolished in Rome; and at a later day they usurped the wealth and power of Spain. Anne of Austria frowned on the libertine addresses of Buckingham, and the result was a war with France. The Duchess of Marlborough ruled Queen Anne, and in consequence we won the laurels of Blenheim and Ramilies. Mrs. Masham became Anne's favourite, and the protestant succession was in such jeopardy, that if Anne had not suddenly died, the Revolution would have been nullified, and James III. would have ascended the throne from which his father had been righteously expelled. Women, then, have done considerable damage. The author of the "Frontier Land of the Christian and the Turk" has given us a new instance of this old saw.

"Moldavia," writes a native historian, "like the Troad, offered the spectacle of a bloody war fought for a princess; she was as beautiful as Helen, and more innocent." The lady thus referred to was Roxandra, the daughter of Basil Luper, Prince of Moldavia, about the middle of the seventeenth century, and of a Mahommetan slave of Circassia, whose marvellous beauty had captivated the Christian prince. The daughter was still more beautiful, and five kings and sovereign princes of Eastern Europe disputed her hand. The father preferred the great warrior, Prince Coributh of Poland; but the daughter declared she would consent to no matrimonial arrangement till she had first seen and spoken with her betrothed. Soon after, she was at the church of the Three Saints on Palm Sunday, when it is the practice for every one to carry the branch of a tree. A youth of noble mien, in the disguise of a humble merchant, approached and gave her the branch he held in his hand, at the same time gallantly saying, what every polite young man would under the circumstances, that the fatigues of his long journey were amply repaid by a glance of her bright eyes. The lady, of course, after such a flattering speech, took the branch—it was the least she could do—and on looking at it, she found on it a piece of paper bearing these words: "He, who burns to win thee, swears to succeed or die." The fair Roxandra concluded this burning youth could be no other than Prince Coributh, and gave him a smile which sent him away happy. Poland was then at war with the Cossacks, and being beaten, was compelled to sue for peace; but the Cossacks required, as the first condition for treating, the delivery of Prince Coributh into their hands. The young prince escaped into Moldavia, where he assumed the name of Argyrius. Here, under this assumed name, he became known to Prince Luper, who took him into great favour, and became known to the beautiful Roxandra, to whom he made love without declaring his real name, and by whom he was rejected on the ground that she would never marry any one but Prince Coributh. Meanwhile the Cossack hetman, after humbling the pride of Poland, returned to the Ukraine to consolidate his power, and to demand the hand of Roxandra for his son Timush. The young lady would not hear of a Cossack husband. The hetman grew furious, and invaded Moldavia: Luper was compelled to yield. But now the scene again changes. The war broke out again; Coributh returned to his country, and by his presence gave new courage to his troops. Fortune was unfavourable to the Cossacks, who were driven back to the Ukraine. The Prince of Moldavia then considered himself at liberty to retract his promise to marry his daughter to the hetman's son, Timush, which she implored him to do; and he now offered her hand to the victorious Coributh, whom she professed to love. The Polish suitor advanced with a numerous and warlike retinue to claim his bride. Timush armed his Cossacks to avenge the breach of faith of the Moldavian prince. The rivals met on their way to Jassy; a long and bloody battle ensued, and Coributh was killed. Bitter were the tears Roxandra shed, and still more bitterly did they flow when Timush summoned Luper to keep his word and to give him his daughter's hand. Roxandra, on her knees, besought him not to do so. Her heart was in the grave with Coributh; she never, never, could be another's. On the other hand, the boyards, fearing the country would be ravaged by the Cossacks, called on her father to save his country by sacrificing his child. The prince was in a terrible dilemma—he knew not what to do. He wished his country well, but he loved his child. At length, however, the crisis terminated, and he resolved to sink the father in the prince. Palm Sunday again came round, and the reluctant bride again went to the church of the Three Saints in procession, and prayed for a miracle to come to her assistance. As she reached the church, she was shocked by seeing those horrid Cossacks again—the very men that had slain the loved one of her heart. Timush advanced from amongst them, and presented the branch he held to the princess, who was considered a patriotic, broken-hearted victim, and who did not dare to raise her eyes from the ground. He said,

"I have won thee, and I claim thy hand."

It was the voice of Coributh, of her brave, and beautiful, and lost one. She looked up and saw, instead of a fierce and savage Cossack, the handsome youth on whom she had bestowed her heart a year ago, who, in the humble guise of a merchant, had made so lasting an impression upon her susceptible bosom.

"You are Coributh," she exclaimed.

"I am Timush," was the reply.

Timush or Coributh, she married him. It seemed that all along it was with Timush she had been in love. Coributh she had never known, not even when he was at her father's court; for he had kept his name secret, in the hope that he would soon return victorious in his real character. The story goes on to say, that when the remains of the Polish prince lay in state before interment, and the features of Argyrius were recognised, she wept for her friend thus suddenly cut down, but less bitterly than she had done for her lover. It is to be hoped that she had no reason to regret his loss. It is to be hoped that Timush made her a good Cossack husband, and that she made him a good wife. If Moldavia had had its Homer, the world would have been familiar with her charms. As it is, her name has long been buried in the forgotten past. All that we know of her is, that she was beautiful, and that for that beauty men fought and died. Nor is it necessary that we know more; imagination will do all the rest.

MICHAEL ANGELO AND JULIUS II.

Painters have never wearied of subjects connected with the history of their own art, which the more they study it, the more their minds are elevated and made capable of rendering their ideas with truthfulness. Sometimes the story selected is a great historical scene in the history of a great painter and of his great patron. In the present instance, however, the picture is an historical imagination, in which a real event, in the life of Michael Angelo, is developed by the painter's ingenuity into an episode of romance. We have already* described the circumstances of the quarrel that took place between Pope Julius and the great artist, who afterwards wrought the sculpture at that pontiff's tomb. We have noticed the scene of their reconciliation, to which a lively writer of French fiction has added a story about his holiness ordering a prelate to be thrown out of the window for daring

* Works of Eminent Masters, vol i. p. 334.

to insinuate an animadversion on the conduct of the very man, who, until that moment, had been in disgrace. However, whether Julius did or did not permit himself to be hurried into this excess of anger, or whether his threat was not altogether an affectation, it is certain his method of patronising art was entirely peculiar to himself. If the artist of the picture we have engraved has not adhered to historical exactness—which, as an artist, who is a poet, or ought to be one, he was by no means bound to do—he has delineated faithfully the characteristic features of the pope, of the painter, of the holy Roman dignitaries assembled round the board, of the attendants, and even of the chamber in which the incident took place. There sits the vain Julius, the haughtiest, the most discontented, the most pretentious, and one of the least noble of the Medici family. Age has heightened the force of his passions; he is angry when any one expresses an opinion before he has spoken, even though that opinion be consistent with his own; he reverses an unuttered determination, lest he should seem to be influenced by others. His large handsome face is lustrous with the fierceness of his mind, and he bends on Michael Angelo the look of an imperious master satisfied with his vassal's submission. At his feet we see the poorest spectacle that human nature can present—of genius kneeling at the feet of power; of a free, aspiring, generous man, humiliating himself, in a servile attitude, before a pretender to infallible authority. The ecclesiastics and statesmen who sit around gaze on the drama enacted before them.

It was the custom of Julius II., as of all his family, to be excessively patronising to men who consented to yield them complete submission. This, which has been called magnanimity, was, as it appears to us, the most ungenerous policy. He used to visit *incognito* the studios of various painters, ascertain their sentiments towards his own person, and treat them accordingly. In public dispensations, also, his conduct was animated by a similar spirit. One pope had given a gorgeous roof to a particular chapel; another had filled a gallery with rare and precious sculpture; another had added a splendid wing to the papal palace in Rome; some had employed artists to raise monuments and memorials of their reigns, on a scale of imperial magnificence, in the hope that their works would never be eclipsed; and it was a maxim with all the Medici, that they should never be eclipsed by the past or by the future. Accordingly, the chisel of the sculptor, the brushes and the colours of the painter, were encouraged lavishly to adorn the public edifices of the Italian capital with the triumphal trophies of art. But Julius II. and his successors were pre-eminently fortunate in having the command of such a painter as Michael Angelo. He was the star of their reigns;

POPE LEO. X. AND MICHAEL ANGELO.

and we doubt if any victory, material or spiritual, obtained by Clement, bestowed such lustre on the period of his rule as the execution of "The Last Judgment." Julius was, perhaps, less sensible of his privilege than Clement, or, at least, was too vain to confess his appreciation of it; for he trifled with the painter, and wasted his heart by empty promises, when he might have been encouraging him to proceed with works that would have conferred immortal honour on the artist's and the patron's name. It is said that he once reproached him with the ambitious character of a painting, the design of which he had conceived. "I paint the portrait of my mind," replied Michael Angelo. He also doubted sometimes whether there was not too poetical a tinge in his delineation of sacred subjects; but this was not one of his serious thoughts, for, with all their errors, the Medici were never ignorant or tasteless enough to be bigots to mere mechanical reality.

SWORD PRESENTED TO GENERAL CHANGARNIER.

GENERAL CHANGARNIER'S SWORD.

Some men win honours, some men have honours thrust upon them. Of the latter is General Changarnier, one of those young African soldiers of France who were brought home in 1848 to serve the Republic, in company with Lamoriciere, Cavaignac, and others. For a time he took no very important part in public affairs; but at last both he and most other soldiers of fortune of the hour saw hope of advancement and of war in the advent of Louis Napoleon Buonaparte. When the latter was elected president, Changarnier placed his sword at his disposal.

The republican party took alarm. It was believed that if Louis Napoleon were allowed to last four years he would betray his oath, and overthrow the government the people had fought for. A large section thought that the time was come to move. The secret societies were re-organised. But this was a great mistake. The fearful June insurrection, which was got up by the Buonapartist and Legitimist parties, to destroy sympathy with liberty, had cost Paris so dear, that there was not a shadow of a chance for an insurrection. The blood of the 20,000 slain in June, 1848, was yet scarcely cold; and though dissatisfied, and fully aware of the intentions of Louis Napoleon, the masses were not disposed to do battle again. A certain party of leaders thought otherwise, and determined to hurry on the catastrophe. Small meetings were held in different parts of Paris, arms were collected, an organisation commenced, and at last a day was fixed.

But the insurgents insisted upon having well-known men at their head. On other occasions they had fought, won the battle, and returned to their homes, leaving men who were quietly at home to reap the benefit. This time they wished those they fought for to come and place themselves at their head. Ledru Rollin was asked to do so. He told the men of the barricades that the time was not yet come. The old insinuation of coward was at once hurled at him, and in an unfortunate impulse of pique and anger, Ledru Rollin resolved to appear as the man of the insurrection before it commenced. The co-operation of a certain portion of the artillery of the national guard was certain, with Colonel Guinard at its head.

On the 13th June, then, Ledru Rollin and one or two other deputies, followed and supported by some national guard and artillerymen, marched through the streets to a public building in the centre of the district usually the first to make barricades. It was intended that the members of the late Provisional Government should sit at the *Conservatoire des Arts et Metiers*, while the insurrection thundered around. But there they sat; not a barricade rose, not a mob collected, which was the less surprising, that barricades are seldom commenced, except under great excitement, at any time but dawn. The people were not prepared to do battle with the future emperor; and after a short time, the representatives sitting at the *Conservatoire des Arts et Metiers* were compelled to disperse ingloriously and seek safety in England.

Meanwhile General Changarnier was winning his sword. A great crowd had collected on the Boulevards, when it was known that there was an insurrection afloat. Near the Rue de la Paix were congregated a mass of men, women, and children, talking of the rumours afloat; some regretting the news, some hoping there was going to be a battle, but all talking, as in the pit of a theatre between the acts. Suddenly up charged the valiant general Changarnier, at the head of a brilliant staff, and a regiment of guards and lancers. The crowd were alarmed at the wild way in which the cavalry rode about, and the chairs which line this part of Paris, were hastily cast across the street to stop the horses, and the crowd fled. The general and his officers and men charged, and cleared "the barricade," as it was described in the *Moniteur;* after which they galloped in all directions, taking many prisoners, and alarming several old women and some nursery maids and children very much. Having executed this manœuvre, the general and his army of observation rode round to the head-quarters of "the insurrection," which, however, was nowhere to be found. Nevertheless, it was declared that the general had that day saved society, and the sword portrayed in our engraving was presented to him as a memorial of the exploit. The subsequent career of General Changarnier is familiar to all. He is well known to be a royalist, and when he saw that Louis Napoleon meant to cut the Gordian knot of dispute, by taking the crown himself, he left him. When the *coup d'état* of the second of December burst upon the amazed and deluded Paris public, General Changarnier was arrested and sent into exile, there to ruminate on the proverbial gratitude of princes.

MARRO, THE HINDOO GROOM.

It has been justly observed, by more than one recent writer on India, that the Europeans do not treat the natives of that country with anything like the kindness and benevolence which should characterise the conduct of men leaving a highly civilised community to live amongst a semi-refined, but extremely observant and imitative people. Much as the religion of the Hindoos leads them to put their faith in caste, and to neglect or ignore all higher feelings and aspirations than those presented to them or exhibited in the lives of the "sacred" Brahmins, yet they keenly mark the actions, and listen to the words, of the *Sahebloke*, as they call the Europeans, and this with a view to imitate the one and reproduce the other as soon as possible.

Lieutenant Crawley had left England at an early age to enter the military service of the Hon. East India Company, and, as good fate would have it, he was posted to the Bengal presidency. Calcutta being the head-quarters of government and of Indian fashionable existence, is naturally regarded with more favour by the incipient soldier than Madras and Bombay. Arrived at Calcutta, Ensign Crawley, with a company of other youths of the same rank, was handed over to the tender mercies of an aged major, who took care of the boys on landing, prevented them, when he could, from falling into the hands of sharpers, and in due time posted them, like letters, for the particular station in the Upper Provinces to which they might be ordered.

Crawley soon obtained a second lieutenancy in the 123rd regiment of Bengal Native Infantry, then stationed at Dinapore, a considerable distance from Calcutta up the Ganges, and in due time was delivered there by the steamer—the cranky old major having himself seen him off. The young officer had escaped from Calcutta with as little loss of reputation and money as could have been expected. It was discovered, indeed, that he knew nothing of riding, and this reputation of his preceded him of course to his regiment; and, secondly, he had only become indebted to an old Hindoo merchant for about twelve thousand rupees (£1,200). As to his unsavoury reputation, he hoped soon to remove it by zealous devotion to horse exercise, until he thoroughly mastered its difficulties and dangers; and as to the second, he knew that many other young men were far worse off than he, and that, by paying forty rupees a month, he would be able to keep down the interest, whilst he hoped soon to be able to pay off the principal by the remittances from the "governor," for which he had earnestly written, strongly urging upon his venerable parent that the cost of his uniform was far greater than either of them had anticipated, and that travelling expenses in India were unconscionable.

Arrived in Dinapore, Crawley began, of course, like all second lieutenants, by purchasing a horse—all the officers rode, and he must ride too. A horse necessitated a groom, and for a groom Crawley hired a big mountaineer, who happened then to be in Dinapore in want of service, and who had previously served the deputy-governor of Bengal.

One day he had been out at dinner, and returned somewhat earlier than usual, vexed and annoyed at the jokes which had been passed upon him. When he arrived, therefore, at the

stables, it was in no pleasant mood, and, as Marro did not happen to be there at the exact moment when he was wanted, the young officer was still more vexed at having to call for him two or three times. At length Marro came running to the spot; he had not expected his master home so soon, and was standing in the immediate neighbourhood chatting with a friend or two who had come into the cantonments to see him, when Crawley rode up. A few trees had prevented the swarthy groom from seeing his master, but he recognised the well-known voice at once, and sprang forwards to seize the bridle.

"Why weren't you here, sir," asked Crawley sternly, "when I rode up?"

"Master come home plenty soon to-day," urged Marro meekly. "I not see master come in."

"Well, sir, another time look sharper," said Crawley, who now stood on the ground, having dismounted, "and this, perhaps, will make you remember to do so." So saying, he brought his riding-whip down upon the bare shoulders of the groom three or four times with all his might.

"Master not hit me," said Marro, standing erect, his fine form swelling with indignation, whilst the blood mantled deeply in his cheeks.

"What, sir, are you going to be insolent?" asked Crawley, coming up again. "Take that, and that, and that." And so saying, he brought his whip again and again into contact with the quivering flesh of the tall Hindoo.

Marro, however, offered no opposition; the first flush of resistance and opposition over, he stood motionless and silent, not the less determined, however, to be revenged. His friends witnessed the assault from the parade-ground, and the colonel of Crawley's regiment—a humane man, bent on putting an end to such scenes—saw the whole transaction from his window above.

The colonel sent for Marro next morning. "Go before the magistrate, my man," said he to the groom, "and state your case. Don't be afraid. I'll get you another place, and I'll be a witness."

This was precisely what Marro had intended to do. He went to the magistrates; Crawley was duly summoned, the witnesses attended, and the young officer was fined fifty rupees (£5) for the assault. He returned to his quarters vowing vengeance against all Hindoos in general, and against Marro in particular.

"It's a shame—a thundering shame," said Captain Basin, whom Crawley had met in the verandah, and to whom he detailed the transaction. "It's a thundering shame; we shall be at the mercy of these niggers at this rate."

"It's infamous," said Lieutenant Spoon, joining the pair; "I never heard of anything more disgraceful. Why, you didn't get half the worth of your money."

"I did not," said Crawley firmly; "I certainly did not."

"I should like to see any of my fellows hauling me over the coals—I should," continued Spoon.

"Why, what would you do?" asked Crawley eagerly.

"What would I do?" repeated Spoon; "why I'll tell you what I'd do. I'd take him back into my service, and I'd catch him some time when he had no witnesses, and I'd give him a flogging that he shouldn't forget in a hurry—I would."

"An excellent idea, 'pon my life," said Basin, taking his cigar out of his mouth, and examining it leisurely as he held it at arm's length between the two first fingers of his left hand.

"A capital idea," ejaculated Crawley, rubbing his hands together; "that's just what I'll do."

A servant was forthwith despatched for Marro, who came, unconscious of the trap that was laid for him.

"I am not at all offended with you, Marro," said Crawley soothingly, "and I don't want you to leave my service on that account. You will stay with me, won't you?"

"If master like, I stop," said Marro, wondering at the young officer's clemency and making a profound salaam.

"O yes, of course you will; you're a very excellent groom, and I don't think a bit the worse of you for what you have done," said Crawley. "There now, that'll do; go to the stable."

Marro, thrown off the scent by this unexpected kindness of manner, had no idea his master had determined that a notable example should be made of him—an example all the more striking and impressive from his size and strength.

The opportunity for this notable example was at length found. Marro was working in the stable; the other servants were out of the way. Crawley resolved forthwith to have his revenge, whilst his two comrades were to assist by keeping everybody out of the way, and leaving the coast clear for their friend. Whip in hand, Crawley advanced into the stable, and shut the door behind him.

"Now," said he, advancing in a threatening attitude to Marro, "now you scoundrel, there are no witnesses, and I'll take the worth of my fifty rupees." He shook the riding-whip ominously as he spoke, bringing it now and then into contact with his boot.

Marro joined his hands before him, after the manner of his class, and bent his body in a deprecating way to the wrathful Crawley. "Master, forgive all," urged Marro. "Master not hit his slave now?"

"Yes, I forgave all till I had an opportunity to revenge—no longer," said Crawley, bringing his horsewhip down upon the bare shoulders of the big groom. "But now," he continued, "I have taken care you shall have no witnesses; and I'll pay you off, thoroughly."

Blow after blow descended upon the naked shoulders of the muscular Hindoo; but there is a limit to human endurance, and even a Hindoo will sometimes rebel. Without saying a word more, Marro sprang upon his assailant suddenly, and, seizing the horsewhip, speedily disarmed his master; for there was no comparison between the physical force of the two combatants.

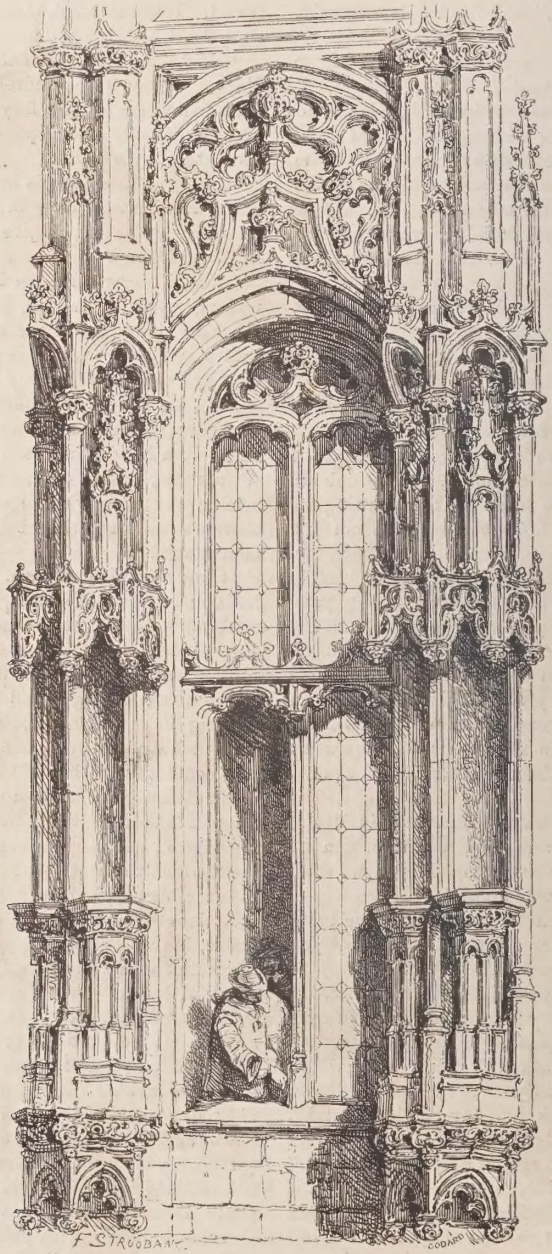
It was now Marro's turn. Holding Crawley with one hand, he brought down the other, with the horsewhip in it, vigorously upon the shoulders and legs of the tyrant-master. An Englishman, however, even of Crawley's stamp, will not quietly suffer himself to be flogged by any Hindoo, big or little. There was a struggle, and Crawley fell beneath Marro, who, holding his master down, plied the whip more vigorously than ever, making it resound as he brought it rapidly and repeatedly into contact with the body of his prostrate foe. The friends of the defeated officer heard the sounds of a struggle and even the words of Crawley, as he swore energetically at the labouring Marro; and they congratulated themselves on the punishment which the obstinate groom was receiving for having dared to bring his master before the magistrate.

At length, having left the riding-whip behind him in the stable, Marro made his appearance, flying away from the scene of conflict as fast as his legs could carry him. "He has learnt a useful lesson," said Basin, as he watched the retreating groom. "Crawley has to thank me for giving him that idea," said Spoon, congratulating himself on his acuteness. They advanced together towards the stable, from which Crawley emerged, looking most unlike a conqueror—looking, in fact, most like a man who had been thrown down upon dirty straw and a dirtier floor, and who, instead of punishing his antagonist, had been punished himself. "Why, what has been the matter?" asked Basin. "The scoundrel has assaulted you," said Spoon. "I slipped," replied the crest-fallen Crawley, smarting with pain and indignation, "and the villain took advantage of it." It was all that Basin could do to restrain his laughter—it was all that Spoon could do to preserve his gravity. That evening, at the mess, there was no other theme of conversation but Crawley and Marro, whilst the Colonel could not refrain, when he heard of the transaction, from giving "Marro" as a toast after dinner.

Crawley had learnt a lesson that he did not soon forget, and, for a long time, he took heed not to use his horsewhip for any other than its legitimate purpose. As for Marro, he was never heard of again at Dinapore. Thinking he had committed a grievous crime, he fled to Benares, and there, under an assumed name, lived happily and prosperously.

THE HOTEL DE VILLE AT GHENT.

This vast edifice exhibits on its various *façades* the genius of epochs far distant in point of time and altogether diverse in character. The most recent contains nine or ten stories of square common-place windows; another is adorned with classic colonnades of the seventeenth century. The north *façade* is one of the grandest specimens of the Gothic style. One single window, in the pointed style, richly adorned with trefoil-work, rises from the base to the summit of the building.



ONE OF THE WINDOWS OF THE HOTEL DE VILLE AT GHENT.

As far back as the thirteenth century, the powerful municipality of Ghent possessed an Hotel de Ville, which then bore the modest title of the court-house. It was rebuilt in the following century; but the new edifice, with regard to the architecture of which we have few particulars, was remarkable neither for its magnitude nor any other circumstance, having lasted only about a hundred years.

The first stone of the present Hotel de Ville was laid on the 4th of July, 1481. Two architects who then enjoyed high repute, Dominique de Waghemakere and Rombaut Keldermans, had prepared the plans for it. The civil commotions which agitated the city of Ghent in 1488 and 1540, besides other obstacles, frequently interrupted the building, which was entirely suspended at the time of the religious wars. From 1580 to 1618 the work of construction was carried on without interruption; but as the pointed style of architecture was, under the influence of the classic reaction, considered barbarous, and had consequently fallen into disrepute, the more recent portions of the structure were built in the Romanic style, and even the part of one of the pointed *façades* which yet remained incomplete was finished in that style. This hybrid mixture of two such different styles of architecture is offensive to the eye of a tasteful observer. The ancient portions are in the florid or tertiary style—the richest, but at the same time the most forced and the least pure. As their ornamentation is executed in soft stone, it has suffered greatly from

the effects of time, and it would be no easy matter now to restore it to its original beauty. The *façade* opposite the butter-market, and in the modern style, is about a hundred and thirty feet long and forty in height. There are three rows of rectangular windows with stone cross-bars, fifty-four in number, separated by Doric, Ionic, and Corinthian columns. Classical in arrangement, pure in style, and imposing in magnitude, this *façade* has no other defect than an excessive uniformity, which gives it a cold, monotonous aspect.

In the interior of the Hotel de Ville the principal object of attraction is the chapel, which was completed in the year 1533. What is called the throne-room is of large dimensions and richly adorned. In another hall there is a very interesting collection of antiquities relating to the place. The archives of the city abound in ancient documents, some of which belong to a remote antiquity extending as far back as the eighth century—among others, a charter bearing the signature of Eginhard, secretary to Charlemagne.

VIEW OF THE HOTEL DE VILLE AT GHENT.

THE EXHIBITION PICTURE.

Artists and authors have ever been prone to make their first efforts for the attainment of fame and fortune in attic altitudes; a choice which not only offers the advantage of cheapness, but precludes all annoyance from lodgers overhead, to say nothing of unpleasant visits from the landlady underneath, especially where the house happens to be three or four stories high, and the proprietress suffers under the affliction either of asthma or rheumatism. Doubtless, it was for the purpose of securing either one or other of these advantages, that our young artist, Reuben Jessop, took up his abode in the three-pair-front of a house in the retired locality of Myddelton-square, Pentonville. Waiving all ceremony, let us introduce him at breakfast, seated before a scanty fire, suffering his toast and coffee to grow cold while absorbed in scrutinising the merits and imperfections of a half-finished painting that rests on his easel, near the window. It is a fancy sketch, portraying a young female of exquisite beauty, standing at a window open down to the floor, looking out upon a lawn from an apartment elegantly furnished, and displaying a breakfast-table laid in a style that exhibits the most exquisite taste and refinement. It forms a picturesque and fascinating little scene of domestic comfort, rendered doubly interesting by the charming attitude and expression of the female, in whose countenance the artist has happily and strikingly depicted the fond and anxious gaze of a young bride, looking for the return of her loved companion from his morning's ramble. What a contrast to the discomfort and desolation of the poor artist's attic! But such evils were almost entirely overlooked or forgotten by Reuben, whose soul was absorbed in the pursuit of his profession. It was to him a world of beauty and delight so enthralling that he was scarcely conscious of existing in any other. With this intense devotion, the young artist combined an anxious yearning for fame that impelled him to unwearied study of the rules of his art, which he pursued with an ardour so unremitting as scarcely to allow himself sufficient time for rest; and as "the labour we delight in physics pain," he never felt the want of relaxation. "What a life! and buried in an attic!" some of our readers may, perchance, exclaim—and no wonder; for there are but few persons who can appreciate that purely mental existence known only to those who are able to create a world of their own and live in it. It mattered not to such a man as Reuben whether he was badly lodged in a desolate attic or enjoyed all the cheering and comfortable appliances to be found in a well-furnished first floor. All the external circumstances of his condition were things entirely apart from the man himself. He was so enthralled by his art, so given to abstract fits of musing, that even a meal to which he had sat down was frequently forgotten or neglected, especially when engaged on any fancy sketch such as that we have already described—now suddenly lit up by a golden burst of sunshine. It reveals to us one of those depictions of perfect loveliness which seem to have had no prototype, unless, indeed, it should happily bring to mind some fairy-like vision which has become daguerreotyped on our memory so strongly that it can never be entirely forgotten—a remark which reminds us of the incident that had impelled our artist to his present labour.

It was on a beautiful day in autumn, when the lingering sunshine, like the farewell of an old friend, seems to console us with the assurance of only temporary absence, that a group of gazers, who had been drawn together by the arrival of a wedding *cortége* at Marylebone church, were clustered together on the pavement waiting to see the bridal party return to their carriages. Twelve o'clock struck, and the number of idlers had increased to such a crowd that many respectable persons stopped also; some because they did not choose to be jostled among a mob, and others in the hope of beholding one or more of those glowing impersonations of female beauty, commonly to be found among the daughters of our gentry and aristocracy. The expectant crowd, among whom was Reuben, had not to wait long ere the wedding party made their appearance. First came the bride and bridegroom, the former so heavily veiled that not only her face but the greater portion of her dress was completely hidden. She was leaning on the arm of her husband, a fine, noble, handsome young man, attired in full military uniform, and accompanied by a veteran officer, the bride's father, a bluff, hearty, jovial-looking old gentleman, whose countenance evinced such delight as fully showed how completely the marriage met with his approval. And now came a troop of bridesmaids, all, not only elegantly attired, but more or less possessed of personal attractions; one especially, the last of the train, a dark, bright-eyed damsel, displaying a countenance so strikingly beautiful as to excite the intense admiration of all the by-standers, and particularly of our artist, who, the instant he beheld the maiden, involuntarily expressed his delight by exclaiming rapturously, "What a perfect Hebe!" There he stood, his eyes intently fixed upon her, as she took her seat in the bridesmaids' carriage, and still he remained rudely staring, and endeavouring to get a parting glance at his idol as the vehicle drove off, a rudeness for which the offender was to be excused by his having found, in that enchanting face and figure, almost a perfect specimen of the style of beauty which constituted one of the most delightful of his artistic idealities. Scarcely conscious of anything around him, our dreamer pursued his course homewards, and the instant he entered his "eyry home," hurriedly snatched up his sketch-book, and having dashed off a reminiscent outline of the morning's vision, threw himself into a chair, with the dissatisfied feelings of a man who has involved himself in a difficulty beyond the means of extrication; he distrusted his ability to give such a depiction as would be worthy of the original. True, he had long resolved to exert his utmost skill, and endeavour to rise above the rank of a mere portrait-painter; to produce a picture that might raise him above his present poverty and obscurity, by gaining a purchaser among the *virtuosi*, and winning the favourable opinion of the public. He had often thought of making such an effort, but never could decide upon a subject. This arose from a secret consciousness that his ideas were far too great for the embodiment of one who was, at present, a mere tyro in his art, and he felt that to fail in a first attempt might be fatal. Great judgment would be required even in a design of a less aspiring nature. It must be something that would find a response in the hearts of the million, while it admitted full scope for the most masterly exercise of his pencil; a subject of a domestic nature, which, it now struck him, he had found in the scene of the morning, and he resolved to attempt it. The result was the little cabinet picture we have already described.

Despite, however, of his having commenced the work, there were moments when a distrust of his ability to give a full and faithful depiction of the beauty of the original he intended to represent as the young bride, came so strongly upon him that he was almost inclined to abandon his attempt; and it was in one of these moods that we find him at the opening of our narrative—suffering under a sad misgiving, amounting almost to a fit of despondency, from which he was aroused by some one knocking at the door of his apartment.

"Come in!" cried he, and, on turning round, beheld the fat figure of Mrs. Sniggins, his landlady, standing before him.

"Have the goodness to take a seat, madam," said Reuben; in compliance with which invitation, the lady, panting with exhaustion, sank into one of the dilapidated chairs which, in conjunction with a ricketty table, and broken-legged bedstead, constituted the chief furniture of the attic.

"Them stairs is such a height!" muttered Mrs. Sniggins.

"They are, madam," replied Reuben, in a tone of sympathy, though at the very moment he was wishing that they were at least a story higher.

"And your rent is a running up so, Mr. Jessop," continued his visitor, "and there's the collector threatening to seize upon me for taxes."

"Dear me! what, seize upon you!" exclaimed Reuben, scarcely able to suppress a smile at the idea of so daring a capture.

"Yes; such an exposure to the neighbours, you know,

sir," continued Mrs. Sniggins; "when do you think you will be able to let me have some money, sir?"

"Soon after that painting you see yonder is finished, I hope, madam."

"That's a very uncertain chance, I'm afraid, sir; for people has no money to lay out on pictures. But maybe you've got a customer for it already?"

"I wish I could say I had, madam; but I hope to procure one."

"Well, I hope you will, I'm sure, and soon too, though I really cannot wait for that; you must let me have some money this week—you must indeed, if it's only a trifle."

"I'll endeavour, madam."

"Pray do; if you can get me half-a-sovereign, it will materially help me in making up the man's money."

Reuben promised; and saying she should fully rely upon his word, Mrs. Sniggins took her departure. Here was the pressure of poverty, of which he was too prone to be unmindful, stimulating him to the completion of his task; for, in order to keep his promise to Mrs. Sniggins, he would be compelled to borrow from a friend who had kindly offered to assist him with his purse, that he might not be harassed while the picture was in progress.

It was intended for the Royal Academy's ensuing exhibition; and, by slightly availing himself of his friend's generosity, he was enabled to devote so much time to the work, and bestow such great pains upon it, that it was not only completed before the required time, but received the highest encomiums from several first-rate judges of art to whom he submitted it for inspection. Within the time appointed for receiving the contributions of exhibitors it was sent in, and shortly afterwards Reuben received an official communication from the Academy, informing him that it had been accepted.

With feverish anxiety he looked forward to the opening of the exhibition; and when at last the day came, he was delighted to find that those whose office it was to superintend the hanging of the pictures had disposed of his in such a manner as to admit of a fair judgment being passed upon its merits.

In the course of the season he made frequent visits to the exhibition, chiefly for the purpose of studying the perfections of those who far exceeded him in his art; though sometimes, with the natural vanity of a youthful aspirant for fame, and elated as he was with the high praise that was lavished upon him by the press, he found himself not only gazing upon his production, but eagerly endeavouring to overhear any eulogium that strangers might pass upon it. Thus again his ambition was gratified; he had gained the first step to fame, and perhaps fortune. During all this time, however, the poor artist, unwilling further to encroach upon the kindness of the friend who had enabled him to complete his task in peace, was secretly suffering such extreme penury as not only to render his meals, dinners especially, very intermittent, but to involve him in the liability of expulsion from his lodging, his landlady having become so importunate that, to avoid her perpetual intrusion, he spent whole days out of doors, which might have been more advantageously employed at home. His only consolation was the daily hope of relieving himself from all such annoyances by the sale of his picture; but day after day passed by without any offer being made for the purchase, and the time was fast approaching when the exhibition would close.

One afternoon, returning from a long morning ramble, he happened to look in at Trafalgar Square, when the exhibition was so thronged with visitors that it was impossible to avoid the occurrence of an occasional crush among the double stream of persons passing up and down the grand staircase. As the hour of closing approached, the crowd thickened, and just as Reuben had managed to squeeze himself through the open door of the exhibition room leading to the landing, he caught a glimpse of something that was lying on the ground in a corner of the door-way. He managed to pick it up, and on examining it as soon as he had reached the street, found it to be a hair-bracelet, set with precious stones in a very costly manner, and having a magnificent ruby in the centre. The back of the clasp was engraved with the initials E. S. B, and a lock of hair, gleaming like silver, was curiously concealed in the gold casing. Reuben was perplexed to know what to do with the trinket, which, on his road home, he ascertained to be worth a considerable sum, and as he had not the means of advertising it, resolved to await the probable announcement of its loss in one of the public journals. The only step he could himself take for its restoration was to leave his address with the porter at the door, in case any inquiry should be made by the owner, who would, of course, be able to give an exact description of the bracelet.

He was preparing to leave home on the following day, when he was met at the door of his room by an elderly gentleman, to whose inquiry for her lodger Mrs. Sniggins had replied by desiring the stranger to walk up, and thus taken by surprise, Reuben was compelled to receive him in his attic. He was a gentlemanly man of about fifty years of age, and having briefly stated the nature of his errand by informing Reuben that his daughter had lost a bracelet at the exhibition only the day previously, proceeded to give an exact description of the one in our artist's possession, adding that it was a trinket she prized, even far beyond its pecuniary value, simply because it was a keepsake from her uncle, who had been absent many years in India, and whose age rendered his return to England, though he had long intended it, extremely improbable.

"I am delighted that it has fallen to my lot to be the means of restoring to its owner so treasured a gift," said Reuben, handing his visitor the bracelet.

"And I," replied the stranger, "esteem it a most fortunate occurrence that the trinket should have fallen into such honourable hands. Had I failed to gain information at Trafalgar Square respecting it, I should have lost no time in inserting an advertisement in the newspapers, offering a handsome reward for it."

"A very annoying and unprofitable species of expense," observed Reuben.

"I should have thought nothing of it," replied the stranger; and then, opening the cavity in the clasp of the bracelet, he added, "this little lock of hair alone we value far more than all the jewels, and I account myself greatly your debtor, sir, for restoring it. In fact," continued he, with the hesitation of a man who was fearful of wounding the pride of a gentleman, evidently in very impoverished circumstances, "I shall be delighted if you will allow me to offer you the amount which, to-morrow, would have actually been due to you by reason of my advertisement."

THE TURKISH LANGUAGE AND LITERATURE.

The Turks, it seems, have a copious literature of their own. M. Von Hammer enumerates two thousand Turkish poets. Till lately, however, they have been almost unknown to the western nations. The most select Turkish poets, says Mr. Morell, are Achih Pasha, Cheikhi, Baki, Nefi, Meschiky, whose "Ode on Spring" was translated by Sir W. Jones, Kemal Pasha, Zadi, amongst the ancients; and the first moderns are, Nebi Effendi, Rhayhyh Pasha, Seed Reefel Effendi, Aini Effendi, Peitery Effendi, Kiahia Bei. Contemplation and mysticism are the characteristics of Turkish as of Persian poetry. It is almost always adorned with a gentle philosophy, resigned to destiny, and with a wise spirit calmly estimating the shortness of life, and admiring the wonders of creation. Before Constantinople was taken, the Turks had distinguished themselves in literature; and since that period, historians, astronomers, geographers, travellers, poets, moralists, and economists, have greatly enlarged the boundaries of their literature. There are even in Turkish many Ottoman histories, not written after the manner of our histories, but presenting a connected picture of events, rigorously observing a chronological order. One of the most valuable points in their histories is, that they preserve numerous specimens, in the speeches of their viziers and

generals, of that manly eloquence whose inspirations once used to electrify the sultan's hosts. The Turkish tongue contains, besides, many valuable translations from the Persian and the Arabic; and some of the manuscripts are said to be much improved in the process, as many hold the "Wallenstein" of Coleridge better than that of Schiller himself. It must be admitted, however, that the Turks, as compared with the Arabians or the Persians, have but few distinguished authors—that they have not one poet comparable to Ferdousi, Saadi, or Hafiz—no philosopher to approach Averroes or Anicenna—that they can boast no discoveries or observations in the exact sciences—and that their literature is chiefly confined to theology, Ottoman history, geography, medicine, and some romances in prose or verse, mostly translated or imitated from the Persian.

As regards the Turkish language, it may be here briefly stated to be a dialect of the Tartar imported to Constantinople by the Ottomans in 1453. Since that period it has become greatly enriched by a large number of expressions derived from the Arabic and Persian, introduced by the Mussulman religion, the necessities of commerce, or the frequent wars of the Turks in Asia. But, instead of modifying its new acquisitions, as the other European languages have done in similar cases, the Turks have received the foreign words without mutilating them. These acquisitions and additions are naturally more frequent amongst the educated than amongst the vulgar, and more common in the written than the spoken language. It is almost indispensable to have some slight acquaintance with Persian, and particularly with Arabic, in order to speak and especially to write Turkish correctly. The latter language is under great obligations to the Arabic. It has borrowed from that its alphabetical characters, system of numeration, and all words expressing religious and moral ideas, as also those relating to science, letters, and art. According to Kieffer and Bianchi, three-fourths of the ingredients of the present Turkish tongue are Persian or Arabic. Mr. J. R. Morell says:—"Regarded in itself, and in connexion with the origin of the nomades who first spoke it, it is clear that it has no greater affinity to Persian and Arabic than Hungarian has to French; but though we may admit that it is inferior in some respects to the noble tongue of Mohammed, yet it greatly surpasses the Persian in number, harmony, and elegance, and it is one of the most beautiful, and undeniably the most majestic, tongues in the East."

In its favour much may be urged. It is of the greatest moment in a diplomatic point of view, being the only diplomatic language used in the Levant—the only tongue used and spoken in the remotest parts of the empire by public officials—indispensable to all commercial enterprise in European and Asiatic Turkey, in the western provinces of Persia on the banks of the Caspian—even at the court of Teheran, where the shah, the ministers and agents of the Persian government, speak little save Turkish—and lastly, without oriental hyperbole, it may be safely asserted that the traveller can make himself understood in Turkish from Algiers to Candahar on the frontiers of India. A tongue so widely spread must be subject to variations of idioms; hence the Turkish spoken in Roumelia differs much from that of Anatolia, and especially from that spoken in the country watered by the Halys, in those provinces traversed by the Araxes, and near the sources of the Tigris and Euphrates. Yet this difference is incomparably less than that between the different idioms of France. It must also be observed that in Turkey, and in all the regions where these semi-barbarous conquerors penetrated, the language of the aborigines still lives. Thus the masses speak Arabic at Algiers and Tunis, in Egypt and in Syria—various dialects of the Sclavonic in Bosnia, Illyria, Servia, and Bulgaria—Wallachian beyond the Danube—and lastly, Armenian and Kurdic in Asia; yet in all these countries you cannot meet a man with any pretensions to education who is unable to speak Turkish. But at Constantinople, the heart of the vast empire, and especially among the court ladies, the softest, purest, and most elegant Turkish is spoken. In England, this language now promises to be a fashionable study.

SIR WALTER SCOTT.

SIR WALTER SCOTT.

On the 15th of August, 1771, Walter Scott was born in Edinburgh. The house stood at the head of the College Wynd, but was pulled down to make room for the new college. At the age of eighteen months, it was discovered that he had lost the use of his right leg, and he was despatched to Sandy Knowe, his grandfather's residence, to see if fresh country air would do him any good. "It is here," wrote Sir Walter, in his Diary, or outline autobiography, "that I had the first consciousness of existence." Here he had a narrow escape from a crazed maid-servant, who was tempted by the evil one to kill him. Here, various remedies were used for his lameness, but in vain—one was, that whenever a sheep was killed, the little fellow should be stripped naked and wrapped in the reeking hide. Here he learnt the ballad of "Hardyknute," much to the annoyance of old Doctor Duncan, the parish parson, who used pettishly to exclaim, when Walter interrupted his sober converse by shouting out his favourite lay, "One may as well speak in the mouth of a cannon as where that child is." Sandy Knowe failing to remove the lameness, Walter, under care of aunt Jenny, was despatched to Bath, where he mastered the rudiments of reading, and for the first time went to a theatre. The play was "As you like it." Walter was scandalised that Orlando should quarrel. "What, an't they brothers?" asked Walter, to the amusement of his neighbours. From Bath, Walter returned to George's-square, Edinburgh, where the family now resided. Glimpses of childish intelligence now became common. A Mrs. Cockburn chatted with him one day. "Aunt Jenny," said he at night, "I like that lady." "What lady?" asked Aunt Jenny. "Why, Mrs. Cockburn; for I think she is a *virtuoso*, like myself." "Dear Walter," said Aunt Jenny, "what is a *virtuoso?*" "Oh, don't you know? Why, it is one that wishes and will know everything." Another lady remembers the child sitting before the house when an emaciated beggar came to the door. The servant told Walter how thankful he should be that he was placed in a situation which shielded him from such want; the boy looked up with a wistful incredulous expression and said, "Homer was a beggar." "How do you know that?" asked the other. "Why, don't you remember?" answered Walter,

> "Seven *Roman* cities strove for Homer dead,
> Through which the living Homer begged his bread."

The reply was smart for a child of seven. From Edinburgh, Walter went to Preston-Pans for sea-bathing. But as he gets older, it is decided that in his ninth year he goes to school; and accordingly he returns home. Despite the rigours of the Sabbath, that Edinburgh home was a pleasant one. Here was brother Robert, afterwards a midshipman; John, who was a soldier, and died a major in 1816; and "unfortunate sister Anne," an invalid the whole of her twenty-seven years of life. Thomas, who died in Canada, was the favourite. Brother Daniel seems to have been a reprobate and worthless from his very birth.

The High School in Edinburgh, when Walter entered it, contained some remarkably clever fellows. He was three years in Mr. Fraser's class, and then, in the ordinary routine, was turned over to Dr. Adam, the rector, and well-known author of the "Roman Antiquities." Walter's school-life was meteoric. His place in the class was everywhere—as often at the top as the bottom. His successes seem to have depended more upon his ingenuity than his scholarship. "What part of speech is *cum?*" once asked Dr. Adam of an incorrigible dolt. No answer was returned. "*Cum*," continued the doctor, "means *with*. Now, what part of speech is *with?*" "A substantive," quoth the dolt, and the whole class burst into laughter. "Is *with* ever a substantive?" said the rector. The whole class was silent, until the question came to Scott, who instantly replied, in the words of Scripture: "And Samson said unto Delilah, If they bind me with seven green *withs* that were never dried, then shall I become weak and as another man." Another triumph, not so creditable, Walter shall tell in his own words:—"There was a boy in my class at school who stood always at the top, nor could I with all my efforts supplant him. Day after day came, and he always kept his place, do what I could; till at length I observed, that when a question was answered he always fumbled with his fingers at a particular button on the lower part of his waistcoat. To remove it, therefore, became expedient in my eyes; and in an evil hour it was removed with a knife. When the boy was again questioned, he felt for the button, but it was not to be found. In his distress he looked down for it: it was no more to be seen than felt. He stood confounded, and I took possession of his place; nor did he ever recover it, nor ever, I believe, suspect who was the author of this wrong." In the usual sports of boyhood, Walter Scott, despite his lameness, took his share. He could run, jump, and "climb the Kittle Nine Stanes" with anybody. When he first made his appearance in the play-ground, he was engaged in a dispute with a boy, who scornfully replied, that it was "no use to hargle-bargle with a cripple." But Walter said that, if he might fight mounted, he would try his hand with any fellow of his inches. An elder boy proposed to lash the two little shavers face to face upon a board; which was done, to the delight of Walter, who ever afterwards, in sets-to, adopted this fashion. The boys of the upper classes in Edinburgh, in Scott's time, had regular pitched battles with the boys of the democracy of that fine old town. In these contests Scott did his part. Yet Scott made progress, and read and appreciated Cæsar and Livy and Sallust, Virgil, Horace, Terence. From Edinburgh, for change of air, Scott went to Kelso, where he read Spenser and Percy's "Reliques," the novels of England, and the romances of the South. Here he began the art which led on to fortune. He used to say to James Ballantyne: "Come, slink beside me, Jamie, and I'll tell ye a story."

At the age of thirteen Walter commenced his student life at the Edinburgh University. Here he seems to have made but little progress. The Latin professor had no influence, and the Greek class were far beyond Scott, who was too indolent to overtake them. At this time we find him dangerously ill, and miraculously recovering. In 1786 Scott was articled to his father, an advocate, for five years. These years seem to have been pleasant ones. He disliked, it is true, the drudgery of his office, and detested its confinement; but he felt a rational pride and pleasure in being useful to his parent. He became a great walker—a great antiquarian—became intimate with Jeffrey and other men worth knowing, and for the first time felt the sweetness and the power of love's young dream.

In 1792 Scott put on the advocate's robe, and a few hours after his admission some friendly solicitor retained him. His love of border legends, however, became a passion, to gratify which many an excursion was planned and many a week devoted. Nevertheless, our young advocate belonged to a club, of which, as usual, he was the master-spirit. On one occasion a certain Rev. Mr. M'Naught, being accused of habitual drunkenness, dancing at a penny-wedding, and singing lewd or profane songs, entrusted his defence to Scott, who grew so free in the description of the penny-wedding that he was called to order. This so damped his ardour, that when he came to quote a verse of the song spoken of, he was scarcely audible. The club, which had crowded in the gallery to encourage him, shouted, "Hear! hear! Encore! encore!" and were immediately turned out of court. Our advocate got through very little to his own satisfaction, and his client lost his case. In 1796 Scott published his translation of Bürger's "Leonore," which, except in his circle of personal friends, proved a failure. At this time there were fears of French invasion, and Scott became an officer in a volunteer troop of horse. Next year a still more interesting incident occurred. Riding in the vicinity of the English lakes, Scott and his companion encountered a lady on horseback so wondrous fair that they followed her—met her at a ball in the

evening; she turned out to be a Miss Carpenter, anglicised from Charpentier, and in December, 1797, became Mrs. Scott.

In 1797 Scott's father died, and his income was comfortably increased thereby. In December of the same year he was made sheriff of Selkirkshire—an office worth about £300 a-year, which at once set him at ease with regard to his family, and relieved him of the drudgery of his profession. Henceforth literature became the sole aim and business of his life. The result is, in 1799, a translation of Goethe's "Von Berlingen," which Matthew Lewis sold to a publisher for twenty-five guineas; in 1802 and 1803, "The Minstrelsy of the Scottish Border," which brought in Scott £100 for the first edition, and the copyright of which he sold for £500. He was now fairly committed to his life-work. "The Lay of the Last Minstrel" was nearly completed, and Scott became a contributer to the "Edinburgh Review," just established by Jeffrey and Sydney Smith.

Scott had no faith in literature alone—if he had, he might have been saved the sad catastrophe of his later years. Accordingly, he entered into partnership with the Ballantynes as booksellers and printers, and looked out for some easy birth which would increase his income with but little trouble. Such a situation he soon obtained, as one of the clerks of the Session, with £800 a-year. This rendered a journey to London necessary. Of course, he became a lion, but that did not spoil him. He amused himself as well as he could, and when he saw that he was expected to roar, would sit down and tell stories and recite ballads, to the delight of all. Already fifty thousand copies of the "Lay of the Last Minstrel" had been sold, realising to the author between seven and eight hundred pounds. He returned to Scotland to work at "Marmion," and bring out his fine eighteen-volume edition of Dryden and other books. In 1810 appeared the "Lady of the Lake," the copyright of which brought him in 2,000 guineas. The next year made an agreeable change in his position. As one of the clerks of the Session his salary was made £1,300 a-year; and Scott became a Tweedside laird by the purchase of Abbotsford. Whilst building and planting, and buying and selling, he was still, however, busy with his pen. "Rokeby" appeared in 1813, and the "Bridal of Trierman" two months afterwards; but, as a poet, he had reached his zenith. Byron had appeared, and Scott was deposed. Tom Moore had also hurt the sale of "Rokeby," by writing in his "Twopenny Post-Bag," that Mr. Scott,

> "Having quitted the borders to seek new renown,
> Is coming by long quarto stages to town;
> And beginning with 'Rokeby' (the job's sure to pay),
> Means to do all the gentlemen's seats by the way."

But Scott had only to shift his ground. If he could be no longer monarch of song, the realms of romance might be his own. He wisely retired from a rivalry in which it was vain to engage, and wrote "Waverley," which appeared in 1814. Scott was now a prodigious lion; he went to London and dined with the Prince Regent. In a few months afterwards we find him at Paris with the Duke of Wellington, the Emperor Alexander, and other heroes of that fearful war which terminated in the downfall of Napoleon and the peace of the world. A little while after, Washington Irving visited Abbotsford. He thus describes him: "In a little while the lord of the castle himself made his appearance. I knew him at once, by the descriptions I had read and heard, and the likenesses that had been published of him. He was tall and of a large and powerful frame. His dress was simple and almost rustic. An old green shooting-coat with a dog-whistle at the button-hole, brown linen pantaloons, stout shoes that tied at the ankles, and a white hat that had evidently seen some service. He came limping up the gravel-walk, aiding himself by a stout walking-staff, but moving rapidly and with vigour. By his side jogged along a large iron-gray stag-hound of most grave demeanour, who took no part in the clamour of the canine rabble, but seemed to consider himself bound, for the dignity of the house, to give me a courteous reception. Before Scott had reached the gate, he called out in a hearty tone, welcoming me to Abbotsford, and asking news of Campbell. Arrived at the door of the chaise, he grasped me warmly by the hand. 'Come, drive down to the house,' said he. 'Ye're just in time for breakfast, and afterwards ye shall see the wonders of the abbey.' I would have excused myself on the plea of having already made my breakfast. 'Hout, man,' cried he, 'a ride in the morning, in the keen air of the Scottish hills, is warrant enough for a second breakfast.'" Such was the hearty, energetic welcome of a hearty and energetic man. As Scott was now in his prime, we must again quote from Mr. Irving, who says, his "conversation was frank, hearty, picturesque, and dramatic. During the time of my visit, he inclined to the comic rather than the grave in his stories, and such, I was told, was his general inclination. He relished a joke or a trait of humour in social intercourse, and laughed with right good will. He talked, not for effect nor display, but from the flow of his spirits, the stores of his memory, and the vigour of his imagination. He had a natural turn for narrative, and his narratives and descriptions were without effort, yet wonderfully graphic. He placed the scene before you like a picture. His conversation reminded me continually of his novels." The best yet remains. "His nature would not allow him to be a satirist. I do not recollect a sneer throughout his conversation, any more than there is throughout his works." This was Scott's happiest time. His income was not much less than twelve or thirteen thousand pounds, his literary exertions alone producing him nearly ten thousand pounds. Friends, riches, fame, had gathered around him. The honour of the baronetcy, which was conferred on him in 1820, added nothing to his lustre. The child of genius has a blazonry of his own. For such, the shows of the world are weak and vain and "of little worth." Had Scott cared less for them—had he been free of the conventional desire to found a race of lairds, which made him toil and pour out his heart's best blood, and rendered dark and dreary his latter days—he would have been a wiser, and a better, and a stronger man. But he hastened to be rich, and fell into a snare. The publishing house with which Scott was connected fell, and in the fall, Scott fell never to rise again. On January 21st, 1826, the crash came. Scott writes: "Naked we entered the world, and naked we leave it. Blessed be the name of the Lord." Again he writes: "I feel neither dishonoured nor broken down by the bad news. I have walked my last on the domains which I have planted,—sat the last time in the halls which I have built. But death would have taken them from me if misfortune had spared them." In vain they told him it was the usual mercantile course to become a bankrupt—that Constable would pay but 2s. 9d. in the pound, and Hurst and Co. but 1s. 3d. He was not a merchant, and if God gave him health and strength he would pay all. Nor was this the only trouble. From his pleasant house he had to wander forth alone. From the wreck of his fortune he could not save even the wife of nine-and-twenty years. They bore her to rest in the vaults of ancient Dryburgh, and the gray-haired knight returned to fight the battle of life with decaying strength and a breaking heart.

The remainder of his story is soon told. Friend after friend departed, yet he worked gallantly. In two years he had gained and paid over to his creditors nearly £40,000. "Now, I can sleep," he writes, "under the comfortable impression of receiving the thanks of my creditors, and the conscious feeling of discharging my duty as a man of honour and honesty. I see before me a long, tedious, and dark path, but it leads to stainless reputation. If I die in the harness, as is very likely, I shall die with honour; if I achieve my task, I shall have the thanks of all concerned and the approbation of my own conscience." And again: "I am now restored in constitution, and though I am still on troubled waters, yet I am rowing with the tide, and less than the continuation of my exertions in 1827 may, with God's blessing, carry me safe into port."

The port was nearer than he dreamt. He complained of loss of memory, of being nervous and bilious, and, finally, of a vile palpitation of the heart, that *tremor cordis*, that hysterical

passion which forced unbidden sighs and tears. In 1830, on his return from the Parliament House, he found an old lady friend waiting to show him some MSS. He sat down for half an hour, and seemed to be busy with her papers; then he rose, as if to take leave of her, but sank down again in his arm-chair, and a spasm convulsed his face. In a minute or two, however, he got up and staggered to the drawing-room, where his daughter Anne and Mrs. Lockhart were sitting. They rose to meet him; but before they could cross the room he fell heavily forward at full length upon the floor, and remained speechless until the doctor arrived and bled him. Renewed depletions and strict regimen were used, and he slightly rallied; but as soon as he recovered a little strength, he again returned to his toil. That toil was soon to be over for ever. We have already reached the beginning of the end. His eye failed—his hand staggered. He was compelled to employ an amanuensis. But work he must and would. Mr. Lockhart begged him to take repose. Sir Walter replied, "I understand you, and I thank you from my heart, but I must tell you at once how it is with me. I am not sure that I am quite myself in all things; but I am sure that in one point there is no change. I mean, that I foresee distinctly that if I were to be idle, I should be mad. In comparison to this, death is no risk to shrink from." Yet he might have lived comfortably if he would. He resigned his clerkship, and had a pension of £800 a year, and his creditors had unanimously passed the following resolution: "That Sir Walter Scott be requested to accept of his furniture, plate, linen, paintings, library, and curiosities of every description, as the best means the creditors have of expressing their very high sense of his honourable conduct, and in grateful acknowledgment for the unparalleled and most successful exertions he continues to make for them." In 1831, Sir Walter gave to the world his last novels, "Count Robert of Paris," and "Castle Dangerous."

It was hoped the feeble flame of life might be kept alive, and the advance of the last enemy destroyed, by foreign travel. Accordingly, in a frigate kindly placed at his disposal by the king, Sir Walter wended his way along the storied waters of the Mediterranean, and amongst scenes fruitful in poetry and romance. He could see Malta, Naples, Pompeii, the city of the dead; Rome, the mother of large empires; Florence, the beautiful; the land of Tell, and the hoary cities and castles of the Rhine. It was all in vain. Death followed on his steps. He could not escape the pursuer. Apoplexy threatened him at every stage. He returned to London, where he lay, speechless and with little motion. One night, Allan Cunningham found a host of workmen standing at the corner of Jermyn-street, and one of them said to him, "Do you know, sir, if this is the street where he is lying?" But he longed for home—for the woods of Abbotsford—for the perfume of heath-flowers—for the breezes and mountains of his own loved land. It was there, not in London, he wished to die. Accordingly, they prepared to retrace their steps. Half-dressed, in a quilted carriage, he was lifted into the street. He was more like a corpse than a living man. The hushed and reverent crowd that saw him go felt that the decree had gone forth, and that vain was the help of man. As he neared home, he revived a little. As they descended the Vale of Gala, the old beloved scenes aroused him; he murmured: "Gala Water—Buckholme—Jorwordle;" and when they rounded the hill at Ladthorpe, and the outline of the Eildon hills arose before him, his heart leaped up within him; and when, in a few more moments, he saw the towers of his own Abbotsford, he sprang up and uttered a cry of joy. The river was flooded, and not being able to cross the ford, they were forced to take the longer road round by Melrose Bridge. When he came within sight of his home, it took the strength both of his son-in-law, Lockhart, and the doctor, to keep him in the carriage. Past the bridge, the road loses sight of Abbotsford for a couple of miles, and during these he relapsed into a state of torpor; but when they reached the bank that looked upon his home, his excitement returned, and he became almost ungovernable.

Home, sweet home, could not save the victim from his fate. In a day or two he was better. One day he asked Mr. Lockhart to read to him. "From what book, Sir Walter?" "Need you ask?" said the old man: "there is but one—the book in which the Master tells his mourning flock: 'Let not your heart be troubled; ye believe in God, believe also in me In my Father's house are many mansions. I go to prepare a place for you.'" At the very last, the old instinct came back. He returned to his study and work. Starting up, a few days before his death, and flinging the plaid from his shoulders, he said, "This is sad idleness. I shall forget what I have been thinking of, if I don't set it down now. Take me into my room, and fetch me the keys of my desk." So they took him there. He smiled, and thanked them, adding, "Now give me my pen, and leave me for a little to myself." His daughter put the pen into his hand, and he strove to close his fingers upon it; but the work of those fingers was finished; they refused their office—the pen fell from the hand that could no longer wield it, and dropped upon the paper. He sank back in his chair, and wept big, heavy tears.

But he grew feebler still. They laid him on the bed which he was never more to leave alive. His mind wandered. Sometimes he seemed administering justice as sheriff, sometimes he was planting; but generally his mutterings were holy words—words in conformity with his position—words from the Bible or the Prayer-book—the old Scotch psalms of his youth—or portions of the magnificent hymns of the Roman Catholic church. Often the watchers heard the solemn cadence of the "Dies iræ," and, last of all—

> "Stabat mater dolorosa,
> Juxta crucem, lachrymosa,
> Dum pendebat Filius."
> "Broken-hearted, lone and tearful,
> By that cross of anguish fearful,
> Stood the mother by her son."

September came, and the end drew nigh. Often he blessed his children and bade them farewell. His last words were: "Lockhart, I may have but a minute to speak to you. My dear, be a good man—be virtuous—be religious—be a good man. Nothing else will give you any comfort when you come to lie here." He paused, and his son-in-law asked if he would see his daughters. "No, don't disturb them," was the answer. "Poor souls, I know they were up all night." He never spoke again. His sons arrived, but too late to be recognised; and so they watched and watched him till he died. On the 21st of September, 1832, all that remained of the great Magician of the North was the memory of his kindly heart—of his stalwart presence—of his rare honour, and his genius, rarer still.

On a cold autumnal day they bore Sir Walter to lay down beside his wife and amid the ashes of his fathers in Dryburgh. His old servants carried the coffin to the hearse, sobbing as they went. His children and kinsmen bore the pall. Thousands and thousands of spectators, nearly all in black, and with their heads uncovered, watched the mournful procession. "Vanity of vanities, saith the preacher; all is vanity." It was no peculiarity in Scott's case. All his fond hopes of founding a family, for which he toiled and struggled throughout the whole of his life, and which led to his sad reverse, have been signally frustrated. His son Walter, who entered the army, did not long survive him, and more recently his grandson, a son of his daughter, Mrs. Lockhart, also died, leaving no other male representative of the poet. The race is not always to the swift, nor the battle to the strong. Man proposes, but God disposes. What Scott did he did valiantly and well; but when he stepped out of his path and sought to be the chief of a clan, he fought with destiny and failed. The result was ruin, and now none live to bear the name. Nor has the world any great cause to grieve. As poet and novelist, his name will endure as long as his own

> "Caledonia, stern and wild,
> Fit nurse for a poetic child."

THE CHATEAU OF BOURSAULT.

It is related that in the time of the crusades, a French lord having fallen into the hands of the infidels, begged permission to go to France and obtain his ransom. Relying on the high sense of honour for which the *preux chevaliers* of those days were so renowned, and of which such striking instances are given by the old chroniclers and romance writers, they granted him a year's liberty, on condition that, before the expiration of that period, he would either send them the stipulated sum or return to captivity. He crossed the seas, went to Champagne, and appealed for assistance to every knight or baron in the district, from whom he had any reason to expect a favourable hearing. But all his efforts were fruitless. The sum he had engaged to pay was considerable, and the nobility had exhausted all their resources; first, in building churches, through fear of the end of the world, which was expected about the year 1000; and secondly, in maintaining religious wars. Meanwhile, time wore on. The brave knight, seeing the close of his respite fast approaching, began to prepare for his return to captivity, from which there appeared no prospect of any other release than death—a death without any of the solaces of religion or friendship, and not improbably embittered by every kind of indignity, if not aggravated by barbarous cruelty. Neither the tears of his wife and family, nor the urgent remonstrances of his friends, who suggested all sorts of excuses for violating his promise, had any power to shake his firm resolve. Like the heroic Regulus, so celebrated in Roman annals—who, having been taken prisoner by the Carthaginians, and allowed to go to Rome, on condition that he should either induce his countrymen to make peace with Carthage, or go back to captivity, urged them to refuse all pacific proposals, and then tore himself from the embraces of his family and friends to fulfil the promise he had made—he turned a deaf ear to all entreaties, and hastened to surrender himself once more into the hands of his implacable foes. It appears that the sultan—unlike most of his race—was not destitute of the milk of human kindness, nor without some appreciation of noble conduct. Having never expected to see his prisoner again, he was the more struck with the loyal fidelity to his word which he displayed. More generous than the Carthaginians, who put Regulus to death with horrible

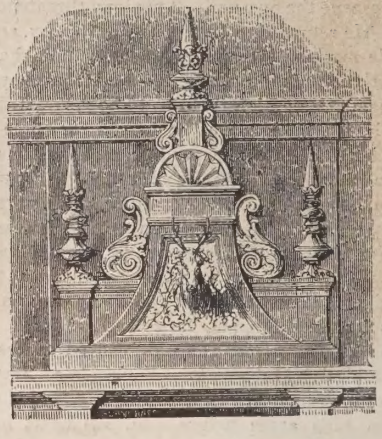
CAPITAL OF THE CHIMNEY-PIECE IN THE LARGE SALOON.



ORNAMENTATION OF THE WINDOWS.

torture, he at once granted him his liberty, begging him, henceforth, to add to his christian name that of Saladin. With this wish he could not refuse compliance, and his descendants, who were long after in possession of the barony of Boursault, in the department of Marne, continued to bear this name as a family title.

A drawing of the year A.D. 1000, represents the ancient château of Boursault in all its strength and glory, with seven towers, a keep, portcullis, moat, and drawbridge. There seems little doubt that it was destroyed by some conflagration, in 1848. It is situated on the brow of a hill amid living springs and beautiful trees, and commands a fine view of the road to Paris, the Strasburg railway, the lovely valley through which the Marne winds its way, and, at a distance, the town of Epernay. On the *façade* is this brief inscription: "*Natis mater*" (a mother to her children); and it was in order to collect her family near her that a lady, whose name is well and honourably known, had this rich and elegant villa erected after the plans and under the superintendence of M. Arveuf, the able architect to whom was entrusted the task of restoring

VIEW OF THE CHATEAU OF BOURSAULT.

for on the soil which was covered with its ruins, a large quantity of cinders and ashes have been discovered. In the course of time, other edifices were raised on the same site, or close by; but among all these, none was so worthy of the original château as that of which a view is given above. It is not, however, a monument built by some nobleman of the court of the magnificent Louis XIV. after the design of a Mansard or a Lepautre. It belongs to an age when, despite the greatest possible merit, châteaus and architects do not easily win admiration—that is to say, the present.

The chateau of Boursault was begun in 1843 and completed the cathedral of Rheims. The style, as a whole, resembles that of the Renaissance. The ground floor may rival in magnificence and taste the most graceful works of the sixteenth century, which adorn the charming borders of the Loire. The principal dining-hall is decorated with splendid modern tapestry and richly carved wainscoting. In the saloon, which is octagonal, is a monumental chimney-piece of Burgundy stone, upon which a magnificent chronometer is placed. All the sculptures are the productions of the most distinguished Parisian artists. A beautiful avenue leads from the front of the building across a large park to the Epernay road.

THE EXHIBITION PICTURE.

PART II.

ALTHOUGH we must here confess that Reuben had been far from unconscious of the fact that the sale of the trinket, should the owner not be found, would prove a positive source of wealth to a man in his desperately needy condition, and that he had been rather inclined to hope for such a contingency, yet his pride, which had prevented him from entertaining the idea of keeping secret possession of property that did not belong to him, now prompted the refusal of his visitor's offer, which he thankfully but unhesitatingly declined. The stranger said no more, but pocketing his restored treasure, dismissed the subject by entering into a conversation on the Fine Arts; the remarks which he made, upon painting especially, evincing such a refined taste, and so high and just an appreciation of the ennobling nature of the art, that Reuben was quite delighted with him, and allowed himself to be led, almost unconsciously, into a familiar chat respecting the difficulties attending the pursuit of the profession, the course of study he had adopted, and the first attempt he had made, by the painting that had been sent to the exhibition, to test his proficiency and ability.

"I never miss visiting the exhibition every year," said the stranger, "but I have not been yet. I intend going, probably to-morrow, and shall have the pleasure of examining your picture, if I can get my daughter, who wishes to pay a second visit and has come to town almost solely for that purpose, to go early. The day she went there, and lost her bracelet, the throng was so great, in consequence of the lateness of the hour, that she was not able to see a quarter of the paintings. By-the-bye, I shall be glad if you will favour me with the number of your picture."

"Allow me to offer you my catalogue," replied Reuben; "I have it somewhere at hand—oh, here—but you will excuse its being disfigured by pencil-marks,—little notes to remind me of the perfections of the best artists."

"A capital guide, sir, for a mere amateur like myself. You will want these notes though, and therefore I shall do myself the pleasure of returning it quickly. But you have not told me the number of your painting."

Reuben named it; his visitor set a mark against it, then began looking over the catalogue, and after a few desultory inquiries respecting some of the pictures, rose, and handing Reuben his card, whereon was engraved, "Mr. I. R. Benningfield, Bryanstone-square," gave him a pressing invitation to dinner any day that he was not better engaged, assuring him that he would be extremely glad to have the pleasure of his acquaintance; "but," continued he "I shall most likely take the liberty of paying you another visit, if only to return this catalogue and let you know what I think of your picture."

"I shall be extremely glad," replied Reuben; "but bear in mind, as regards the picture, that it is really little more than a portrait—a sketch from memory of an extremely lovely countenance that I caught sight of for an instant in the street—in my opinion, a close approach to perfection; so much so, indeed, that the critics have all given me credit for a very poetical fancy."

"I shall let you know what I think of it when you favour me by complying with my invitation, if not before; for I have a slight idea that, perhaps, I can render you some little service in your profession."

Reuben expressed his thanks, and Mr. Benningfield departed. A few mornings afterwards, our artist was called down stairs to receive a packet from the hands of a footman, who said that he had been ordered to deliver it to Mr. Jessop personally. On opening the parcel, Reuben found it to contain the returned catalogue, and something more—a note enclosing a cheque for £100, which the writer said he hoped would secure him possession of the painting as soon as the exhibition closed, although the price he had taken the liberty of fixing upon it was far below its value. The note concluded by naming a day for Reuben's visit, which the writer said would be far more gratifying and satisfactory to both than any written communication.

Highly delighted, not only with the munificence thus displayed, but with the manner in which it was exhibited, Reuben immediately wrote a reply acknowledging the receipt of his friend's very handsome remittance, and accepting his hospitable invitation. The day arrived; our artist hastened to keep his appointment, and was received by Mr. Benningfield in so cordial a manner as to leave no doubt of the very friendly feeling he entertained towards him. The picture had excited his warmest admiration; he spoke of it not only as a work of art that showed both taste and talent, but said that he regarded it as a positive treasure, of which he esteemed himself most fortunate in becoming the possessor.

Dinner being announced, Mr. Benningfield ushered his guest down into the dining-room, where he apologised for the want of a more social reception by stating that his family were out of town, his daughter having been in London only occasionally for a day or two. She hoped, ere long, to have the pleasure of thanking him personally for the return of her bracelet. When Mr. Benningfield and his guest had finished their repast, and were seated over their wine, the former gradually led his young friend to divulge the present position of his affairs, evidently with a view of being able to ascertain what prospect he had of overcoming the difficulties that were opposed to his advancement in his profession. This led our artist to unbosom himself so freely that, before they rose from table, Mr. Benningfield was in full possession even of Reuben's private history—that of one who had early been bereft of his nearest relatives—and the youth was delighted to find, from the warm-hearted sympathy the details excited, that his confidence was not likely either to be unappreciated or misplaced. The correctness of such surmise was, in fact, speedily proved by Mr. Benningfield's expressing his willingness to render him any service that lay in his power.

A few days afterwards he visited Reuben in a new abode, which the handsome price he had given for his picture had enabled him to procure, and afterwards made him a present of sundry additions to his furniture, without even apprising him of any such intention. Scarcely a day passed without his calling; sometimes spending the whole morning in the artist's studio, and finally insisting upon taking his *protégé* home with him to dinner.

It so happened that a number of days now transpired during which, to his great surprise, our artist saw nothing of his patron; and at last, thinking he might be ill, Reuben determined to make a morning call. His face was so familiar to the footman who opened the door, that the latter, dispensing with the formality of a card, hastened to acquaint his master, and returned in an instant to conduct Reuben into the drawing-room, where he was received by Mr. Benningfield, and introduced to a party of ladies, amongst whom he instantly recognised the lovely original of the bridesmaid whose portrait he had so faithfully depicted. While he was yet bowing, stammering for something to say, and looking so exceedingly confused that the young lady could scarcely suppress a smile, her father suddenly turned the tables by introducing the bashful youth as Mr. Reuben Jessop, the artist to whom she was indebted, as well for the restoration of her bracelet, as for the honour he had conferred upon her by making her the subject of his talented pencil.

"A presumption for which I most earnestly entreat the young lady's pardon," observed Reuben.

A smile that lit up the dazzling beauty of the maiden's countenance to a height that might have baffled even the pencil of Titian, conveyed to Reuben the full assurance of his having in no wise offended; and in this he was confirmed by the damsel's father, who, as if to break the awkward pause that now ensued, exclaimed—

"Oh, you need not be at all afraid, my dear sir, of having given any offence; on the contrary, we are all very much obliged to you; but perhaps you will have the goodness to inform us when and where you took that young lady's likeness."

"It was impossible," replied Reuben, "to forget the features of a bridesmaid who far excelled even what a poet might have depicted in describing the beauty of a bride."

"The bridegroom," said Mr. Benningfield, "being a fine young fellow in regimentals, and the marriage taking place at"—

"Marylebone church, sir," interrupted our artist, "where I had the good fortune to arrive just in time to see the wedding party return to their carriages,—an incident I shall ever remember with the utmost delight."

"It only shows to what a trivial circumstance a man may be indebted for exciting him to the display of talent which otherwise he might have been unconscious of possessing," sagely observed the old gentleman, whose *protégé* was puzzling himself for a reply that might render the conversation less personal. He was fortunately relieved, as he fancied at the moment, by the sudden entrance of a very elderly and remarkably yellow-faced gentleman, attired in a morning-gown of an extremely showy oriental pattern; but the intrusion of this personage proved only a source of fresh trial to Reuben's diffidence.

"Allow me, my dear brother," said Mr. Benningfield, "to have the pleasure of introducing you to my young friend, the talented artist with whose admirable likeness of Emily you have been so especially gratified. Mr. Jessop—my brother Robert, whose sudden and most unexpected arrival from India has prevented my intrusion into your studio during the last few days."

"Give me your hand, Mr. Jessop," said Uncle Robert; "I'm delighted to see you. I could never have anticipated such a gratification, sir, as you have afforded me by that life-like portrait yonder," and he pointed to the picture, which, till now, had escaped Reuben's notice, though mounted in a handsome frame, and hung in a conspicuous place near the window. "I never saw such an admirable likeness in my life, sir, never; and permit me to assure you that, from what I have heard of you from my brother, to say nothing of the high admiration I entertain for your talent, I anticipate much pleasure in your acquaintance. I have returned to England to spend the remainder of my life with my family, and save them from being plagued with the sale of my estates in India after my decease, although," added he, casting a facetious look at his niece, "I have not the least idea of dying for a number of years yet, I assure you. No, I am only in my prime at present; and by-the-bye, sir, now I think of it, you shall paint my portrait. I have a host of friends and acquaintances, and if you make a good likeness, it may be of service to you. You shall begin to-morrow." The artist bowed his assent.

Reuben presently took his leave, but repeated his visit on the following morning, when the old gentleman had his first sitting for his portrait, and thus our artist became a complete *habitué* of the house, and so ingratiated himself with all, especially with the original of the portrait (which proved an excellent likeness), that he at last ventured to make an avowal to Emily of the passion he had long cherished, and was delighted to find himself favourably received.

Reuben had just finished a family group, containing the likenesses of two young ladies who had been Emily's schoolfellows, and was submitting it to her uncle for inspection, when the latter exclaimed: "I think it is high time, young man, that you made your fortune, and I have long intended to give you a substantial lift. My friends, however, do not patronise you so handsomely as I could wish, and therefore," added the old gentleman, "I advise you to try something else besides portrait-painting."

"Something else, sir!" exclaimed Reuben, with a look of amazement so excessive that his friend could hardly refrain from laughter.

"Yes; but you need not look so perplexed; it is nothing at all extraordinary that I have to propose to you, though it has been both the ruin and the making of many. What do you think of matrimony?"

Reuben made no reply, but his look was sufficient to convince the inquirer that his intended offer would be rapturously accepted.

"I can see very clearly," continued the latter, "that you and my niece are far from being averse to each other. If I give her ten thousand pounds for her marriage portion, I am sure you will have no difficulty in obtaining her father's consent; and then I think you may make matrimony a sort of helpmate to portrait-painting, without having to plague yourself with such yellow-ochre-looking old fellows as I am."

We think our readers will agree that the correctness of the proposition thus laid down was perfectly undeniable. It was thankfully accepted, and although many years have elapsed since it was carried into effect, it has been found to answer so well, that the friends of the married couple are unanimous in declaring it to have proved a golden idea, by which the greatest possible happiness has been realised.

THE IMPERIAL THRONE OF RUSSIA.

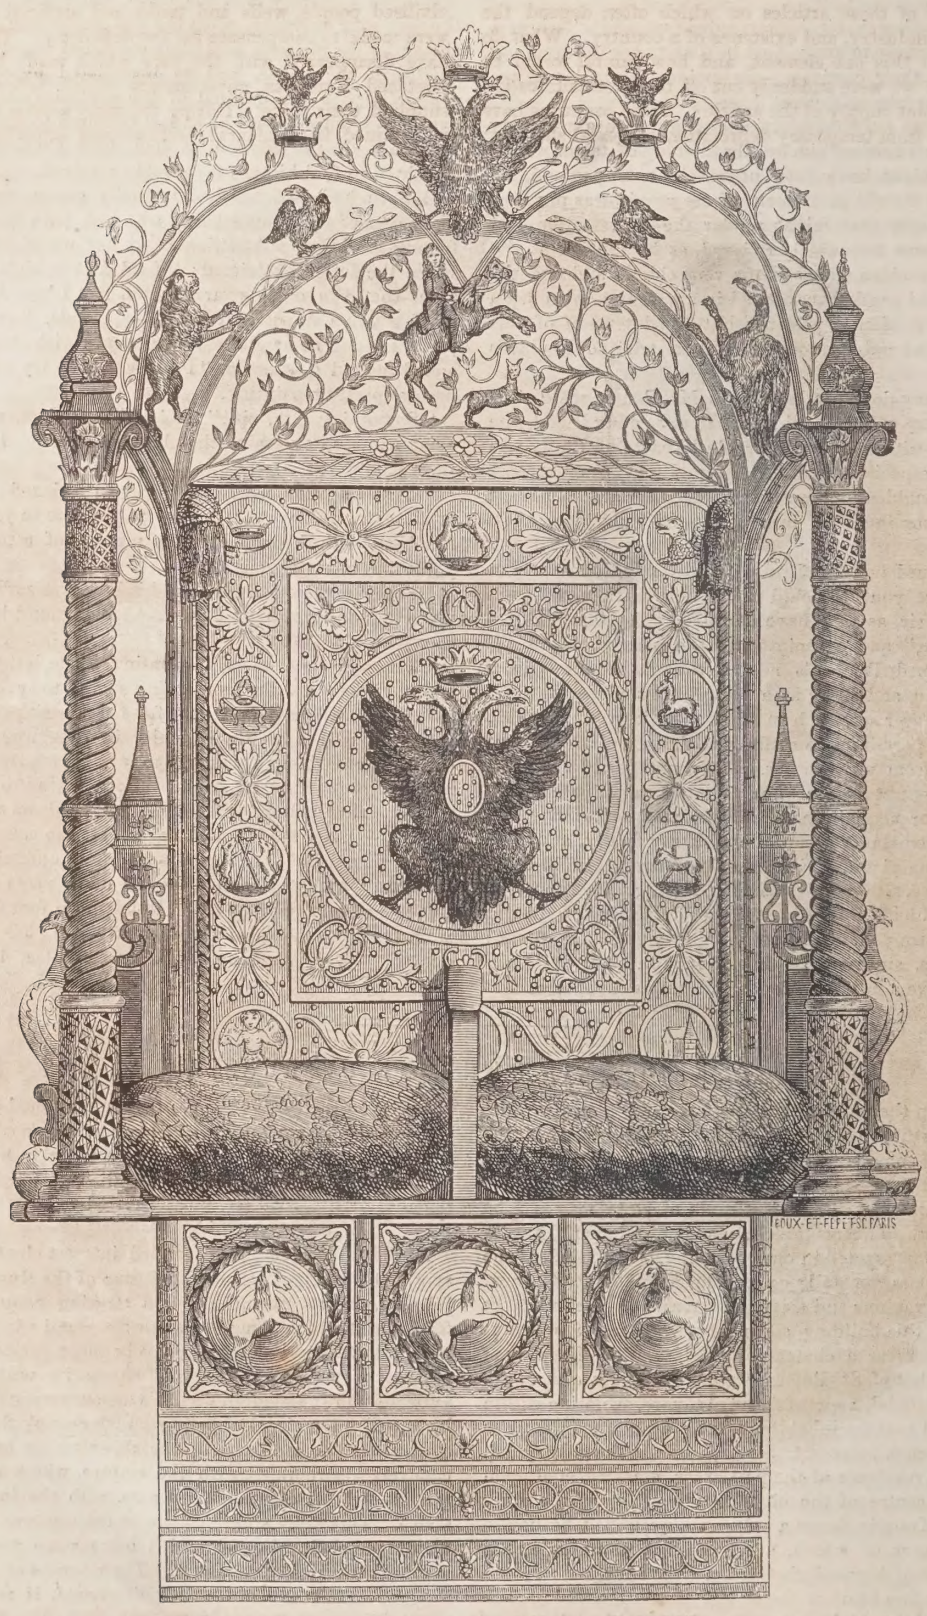
At a time when the crooked policy of the Emperor of all the Russias has disturbed the peace of Europe, checked the beneficial growth of commerce, and put a stop—for a brief period only, it is to be hoped—to the onward march of human progress, some particulars respecting his throne of state may not be without interest. This magnificent emblem of imperial authority, which is represented in our engraving, is in the hall of the Kreml, or, as it is generally called, the Kremlin, at Moscow. Nearly all geographers and travellers have made great mistakes with regard to this building, some representing it as a monument, and others as a chateau or a palace. The Kremlin of Moscow, like that of St. Petersburg and other Russian cities, is an immense citadel, a sort of fortified square, enclosing within its precincts all that the inhabitants hold most sacred; such as churches, convents, palaces, treasures, arsenals, the holy synod, the senate, the residence of the patriarchs, etc. Erected upon a hill, in the centre of the city, on the banks of the river Moskwa, the Kremlin forms a polygon surrounded by boulevards, the largest of which, a magnificent promenade, has borne the name of Alexander's Garden since 1822.

Let us enter this heart of the city of Moscow, noticing each portion in detail; make our way through the cluster of churches, convents, and palaces; and penetrate to the Granovitaia Palata, or angular palace. It is so named because its exterior is cut into a great number of faces. The Muscovites regarded it as one of the wonders of the world two centuries ago. In the present day, however, it is little more than a curiosity in their estimation—though a national curiosity, and preserved with something like the sacredness of a palladium. This strange palace is composed of a singular hall, supported in the centre by an enormous pillar, towards which the portions of the roof technically called voussures, or covings, descend and converge.

Historical associations of varied interest cluster round this spot. On the right we see the throne of the Russian emperor, forming, by its magnificence, a striking contrast with the feeble light which comes through the small windows. It has been erected within a comparatively short period in the place of that of ancient emperors. Hence its ornamentation is altogether in the modern style. Our engraving represents the back. The ten circular devices which occupy the sides of the square are the emblems of the states which have been successively incorporated with the empire, which is denoted by the two-headed eagle in the centre, with the imperial crown above. This eagle appears again at the top, over the figure of St. George or St. Michael, which bears some personal resemblance to the present emperor. The richness of the columns, the arabesques, and other embellishments, is rendered sufficiently apparent by our illustration.

It is upon this throne that, after the ceremony of consecration, the czar receives the homage of the clergy, the court, and the dignitaries of state. Thence he goes forth to the grand festival, where, according to ancient usage, he is waited upon by his most distinguished officers and chamberlains. This

throne is to the Russians the symbol of both temporal and spiritual power; for the czar is at once their emperor and pope—the sovereign of their bodies and their souls. Towards this throne, as towards a double sun, the eyes of forty millions of Slavonians turn with reverence, while they await the day in which their emperor shall be the sovereign and pontiff of the whole modern world, just as the Romans of old, after having found a skull in the foundation of the Capitol, looked from century to century for the universal domination of their empire.



THE IMPERIAL THRONE OF RUSSIA IN THE KREMLIN AT MOSCOW.

CAVERN WELLS OF YUCATAN.

WATER is one of those articles on which often depend the whole wealth, industry, and existence of a country. What do we not owe to this one element, and how painful would be our position if we were suddenly cut off from communication with an abundant supply of the article? Some countries have suffered much from temporary deprivation of genial showers; drought has brought maladies and devastation; but rarely is there remarked so total an absence of the element as in portions of modern Yucatan. This remarkable seat of ancient empire, this field of ruined cities, where aqueducts and water-tanks are often found, is singularly wanting in natural supplies of water. In past times, when the country was inhabited by a civilised people, wells and tanks and artificial water-courses were made to compensate for the deficiency. These resources have disappeared with the race which made them, and the wretched European governments which followed have not supplied their place. During the rainy season a small supply is obtained from natural hollows and artificial tanks; but, this over, they would be entirely destitute, were it not for those vast reservoirs which nature has provided in the very bowels of the earth, whence, by the exercise of immense labour and exemplary patience, a scanty supply can be obtained. The difference between a country in the hands of the energetic Anglo-Saxon race and one possessed by the

THE CAVERN WELLS OF YUCATAN.

effeminate Mexicans, is illustrated by a comparison between the great Croton aqueduct and the primitive resources of the Yucatanese.

Mr. Stephens informs us that the village of Telchaquillo is wholly supplied with water from a cave round which the houses of the village have been built, the origin of the hamlet being probably the fact of the existence of the cave. From a little distance the spot appears level and flat, and the traveller is often startled to behold women walking across the square with cantaros on their heads, and disappearing as if by a stage trick. A closer inspection, however, shows a vast orifice, like the mouth of a cave, and down this five hundred steps, descending beneath a huge arched roof, sixty feet high, to the water, are discerned. The whole is illuminated from the entrance. The well is apparently exhaustless, but never rises or falls, except a little during rain. Women, who in savage and semi-savage states are always the hewers of wood and the drawers of water, are continually ascending and descending to supply the wants of a whole community. Swallows fly in and out, and give additional life to the scene.

At the ruins of Xcoch, there is a well, even more curious, which was, it is believed, the sole dependence of a large and populous city. The people in the neighbourhood knew little of it, but described it as a vast subterraneous structure, adorned with sculptured figures, an immense table of polished stone, and a plaza with columns supporting a vaulted roof; and it was said to have a subterraneous road, which led to the village of Mani, twenty-seven miles distant. Stephens visited it, and brought a true account. In the centre of a grove of trees, so thick as to be close and sultry, without a breath of air, is a great circular cavity or opening in the earth, twenty or thirty feet deep, with trees and bushes growing out of the bottom and sides, and rising above the level of the plain. It was a wild-looking place, with a fanciful, mysterious, and almost fearful appearance. This cavity was the entrance to the *pan*, or well. At one corner was a rude natural opening in a great mass of limestone rock, low and narrow, through which rushes constantly a powerful current of wind, agitating the branches and leaves in the area without. This is the mouth of the well; and so violent is the wind as to cause the incautious intruder, who is unprepared, to be driven back gasping for breath. Long strips of the castor-oil plant are used to visit it. The entrance is about three feet high, and four or five wide, descending at an angle of about fifteen degrees; and it must be entered on your hands and knees, with this strong current of air against you, like the crocodile mummy pits of Egypt. A single track in the floor, worn inches deep by the treading of thousands and thousands of the citizens of the ruined city, and the roof blackened by myriad torches, prove the well to have been, at one time, the only watering-place of ancient Xcoch. A hundred and fifty feet in advance, the passage widens, and rises to twice a man's height, while the air is still and the temperature warm. Vast stalactite pillars round a huge vaulted chamber succeed, after you have passed many passages, and a stone the Indians call a *mesa*. Further on, you climb a high broken piece of rock, and then crawl through a long narrow fissure, leading to a rugged perpendicular hole three or four feet in diameter, with steps worn in the rock, where the heat is terrific. Descending this, you reach a ledge of rocks, with a yawning chasm on the left. Some rude logs, laid along the edge, with a pole for a railing, serve as a bridge; crossing this, the passage turns to the right, narrowing to three feet in both height and width, and descending rapidly. The air is now close and faint. The labour, fatigue, and exertion, are awful. At the end of fifty feet it again doubles, contracts, and descends to a spacious cavern, after which there is another perpendicular hole, leading, by means of a rude and rickety ladder, to a steep, low, crooked, and crawling passage, descending until opened into a large broken chamber, in which is a deep hole or basin of water, with a pole over it to lean on to fill the gourds. This watering-place is now not used, as there are no inhabitants in Xcoch, but there are two others in daily use quite as extraordinary.

The first visited is that of Chach. We have said that women in Yucatan draw the water. But in Chach the labour is too great for the fair sex. You first descend a hole by a perpendicular ladder, at the foot of which is a great cavern, then a second almost perpendicular descent, a resting-place, then a hole two hundred feet deep, then a low narrow passage which enlarges and contracts, a great chasm, another perpendicular hole, another low crawling passage, and then a basin of water, which is the well. The toiling Indians bearing their torches, some above and some below in the deep hollow-sounding shafts, give the place a strange unearthly appearance. The whole length from the mouth of the well is fifteen hundred feet, and the water-carriers having to crawl, do not carry the calabashes on their shoulders, but suspended from their heads. This well was the sole means of obtaining water in Chach.

At Bolenchen (*Bolen*, nine, and *chen*, wells), the population during the rainy season is supplied from nine circular openings of no great depth in the rock, which have collected the population around. But in the dry season there is no resource but the great well of which we give an engraving (p. 481). The entrance to this cavern is broad and lofty, under a bold ledge of rock, following which for about sixty feet by torch-light, you descend twenty feet by a ladder. All light from the entrance is now lost, but the edge of a vast perpendicular descent is reached directly, to the very bottom of which a strong body of light is thrown from a hole in the surface. A huge ladder, of the most primitive description, descends to the bottom of the shaft. It is seventy feet by twelve, and fashioned of the trunks of young pines, lashed together, and supported all the way down by horizontal trunks, fastened to the rock. The ladder is double, having two sets or flights of rounds, divided by a middle partition, and the whole fabric is lashed together by withes. "It was," says Stephens, "very steep, precarious, and insecure. Our Indians began the descent, but the foremost had scarcely got his head below the surface, before one of the rounds slipped, and he only saved himself by clinging to another. The ladder having been made when the withes were green, these were now dry, cracked, and some of them broken." Mr. Stephens soon reached the foot of the ladder, as represented in our engraving, but this is only the beginning of the cave. We now quote the words of one who himself visited the place since Stephens, and on whom we can fully rely:—

"We are as yet but at the mouth of the well, which is called Xtacumbi Xunan (La Señora Escendida), and here we must pause to explain these words. Every year, just as the nine wells are at their last gasp, the ladders undergo a thorough renewal, which done, a great *fête* is held in the cavern at the foot of this ladder. The walls of a lofty chamber, with overhanging roof and level floor, on the side leading to the ten wells, are ornamented with branches and hung with lights, and the whole village comes out with refreshments and music. Now be it told, that in the town of Bolenchen dwelt, many years ago, an Indian lady of great wealth and many possessions, who had, however, above all, a pretty and interesting daughter. Of course many fell in love with the lady, and, equally a matter of regular occurrence, the most ardent lover and the most favoured suitor on the part of the damsel was a poor fellow of the name of Saebeg, who had naught save a handsome face to trade with. The mother would not even speak to him, and forbade her daughter holding any communication with Saebeg. The village *fête* of *cuera* came round; Saebeg and his fair mistress were of course present, but at the close of the day these persons were nowhere to be found. For a whole month they were sought in vain, at the end of which period Saebeg presented himself very gravely before the angry mother, and asked permission to marry her daughter. It was given, and, at Saebeg's request, the lady and the priest went with him to the cave. In a secret chamber which Saebeg had discovered they found the bride, with just enough provision left for one day. They were married on the spot."

On the side of the cavern is the opening in the rock, which leads by an abrupt descent down another long and trying

ladder; this past, and moving along by a slight ascent over the rocks, at a distance of about seventy-five feet, you come to the foot of a third ladder, nine feet long; two or three steps beyond, one five feet high, both of which you go up; and six paces further, a fifth descending, and eighteen feet in length. A sixth is passed, and then comes a seventh. This is laid on a narrow sloping face of rock, protected on one side by a perpendicular wall, but on the other open and precipitous. You then follow a broken winding passage two hundred feet long, and descend a ladder, eight feet long, at the foot of which is a low stifling passage. Crawling along this on your hands and feet, at a distance of about three hundred feet you come to a rocky basin full of water, fourteen hundred feet from the mouth, and five hundred feet perpendicular in the earth. This basin is the Chacha, which means *aqua colorado*, or real water.

From the open chamber above alluded to, several passages diverge, and following one of these, by a weary and tiresome way, you reach the *paduelha*—a basin of water that ebbs and flows like the sea. It recedes with the south wind, and increases with the north-west, and the Indians add, that when they go to it silently they find water; but when they talk or make a noise, the water disappears. The Indians also say, that forty women once fainted in this passage, since which they have not allowed them to go alone. The third basin, in another part of the cave, is called *sallah*, which means spring; the fourth *akahba*, on account of its darkness; the fifth *chocoha*, because it is always warm; the sixth *osiha*, which means milky; the seventh *chimaisha*, because it has insects called *ais*. This is the only watering-place of a city of seven thousand inhabitants. Nothing better than this can explain the difficulties under which the inhabitants of this part of the world labour.

BEAR HUNTING.

Bear-hunting is a favourite amusement both in the Old and the New World. In Europe it is made rather a matter of mere fun and merriment than anything else; but in America the animal is hunted also for the purpose of procuring nutrition and favourite food. "Bear's meat" is well known on every border. It is eaten with rare gusto by the hardy borderers, who, give them venison, bear's flesh, corn-juice, and tobacco, are as happy as the day is long.

Bear-hunting has some time been unknown in this island; though every now and then we are made to believe that the animal is not so rare as we fancy, by the exuberant announcement of some speculative hairdresser—or, to speak in more modern style, of some *coiffeur*—that another bear has been slaughtered. We may occasionally also see one of these animals in a show; or, if we pay a visit to the valuable Gardens of the Zoological Society, we may also gaze on one or two fine specimens. All the great polar travellers, Ross, Parry, and the ever-memorable Franklin, demonstrate the way in which the Arctic Regions are peopled by these brutes. They are there apparently at home, and many a deeply-exciting narrative of adventure, recorded in the journals of these adventurous sailors, proves how dangerous such creatures are to man. The great polar bear, however, is very different in his characteristics from the black bear of the German forests, of the Pyrenees, of Bohemia, and other places, where they still linger in spite of the progress and advance of civilisation.

Dogs that would fight the bear were wont to be great favourites with chase-loving monarchs; but for a good, hearty, genuine bear-hunt the reader must go to America. Some of the virgin forests of that vast and even now half-unknown region contain so large a collection of these animals, that there are men who devote their whole existence to bear-hunting. They are not found in such plenty and with such ease as they were in the days of Boone, but still the hunt is tolerably productive to the persevering hunter.

On the borders of Tennessee and Kentucky was once a place rich in bears—it was a perfect paradise of bruins. Passing over a country of a level character, rich and lovely, dotted here with flowers, there with Indian corn and tobacco, the traveller soon reaches a wilder country, a perfect wilderness, with cliffs and gorges and streams. Nowhere—and we speak advisedly—nowhere is scenery of a more striking character to be seen than round the Pilot Knobs of Kentucky.

The keen lover of sport would start up to this cold and desolate region, camp out beneath a tent under a tree, or perhaps take refuge in a cabin built by one of the old class of hunters. A fine pack of dogs, fit for either deer or bear, ready for a peccary pig at a pinch, were collected, and with these and a rifle, the young men would go forth as of old, with horn and hound to the wild and exciting chase.

The favourite time for hunting, among the gentlemen of Kentucky, is when the first snow-storm is on the ground. Then their enjoyment is in perfection, for they are sure of their game, and that game is in a goodly condition—as killers of another sort, in more civilised regions, would say. It is very singular to follow the game, the panting hounds driving them out upon the soft snow, in which you sink over your ancles at every step. The difference of such sport from that pursued in this island by more scientific sportsmen, is the subsequent result. No warm house, no groaning board, with good things of every kind smoking and shining, no soft voices to welcome the huntsman home. But the camp fire has its charms. It is pleasant at even, when wearied and exhausted with the day's work, to see its warm glow amid the distant trees; it is pleasant to sit with your comrades around it, and enjoy with a zest—only known on such occasions—the broil, or the roast, or the stew, cooked with a hunter's skill and consumed with a hunter's appetite; it is pleasant, when eating and smoking and talking are over, to lie down before the genial fire, and rest and sleep the heavy sleep of the woodsman. There is something of the excitement of the bivouac about it, without any of the terrible, sad, and ruthless images which are attached to the picture of war, that fearful scourge which civilised man submits to only from sheer necessity.

Up one starts then at early morn, as the first streak of dawn falls warm upon the tree tops, and snatching a hasty meal, away we go, over hill, over dale, over plain, over stream, there, where the dogs lead us. The dogs are far a-head, away in some barren or rich bottom. Hark! as they open. Man and beast are equally eager for the fray. The dogs which have been far a-head have turned the prey, and nearer and nearer they come with a louder and louder wail, and the excited huntsman starts as he catches the glimpse of some huge black bear, bowling by at a pace and in a way which would be ludicrous to a dispassionate spectator. But the hunter only sees the game. His rifle is discharged, the beast is wounded; if slightly, to make it move quicker; if severely, to induce it to seek a tree. The hounds, now wild with excitement, dash at it, and it disappears from sight. But its pace slackens, and the hunters are near it again.

It is up a tree. The able author of the "Hunter Naturalist" informs us, that it has been known to roll into a ball, drop among the dogs, and make away. But in general, when once it is treed, it is all over with it. Nothing can stand against the rifle of the Americans. A few shots and it is down, and the chase is over.

In America and in Europe, it very often happens that the animal will turn at bay. It is then a scene of terror. Such clamouring, such noise, such growling, such yelling. The dogs will fasten on the brute, and only let go their grasp with death—they fight until dashed to the ground sprawling and helpless. The contest is now a fearful one. The weight of the bear gives him a great advantage. He crushes the hound in his horrid hug; he tears them with his teeth; he dashes

them to the ground with his paws; he tosses them almost as a bull would, until they fall around. Our engraving represents rather the episodes of a European bear-hunt, just when the dogs fasten on the animal, and one already has paid the penalty, and while the hunters are yet distant, than one of those with which we are personally familiar. But the scene is very similar in character, differing only in the usual way in which events are unlike, from the nature of the country and the people.

A BEAR ATTACKED BY DOGS.

In Europe, bear's hams are celebrated among many epicures, and few persons deny the utility of a bear's skin; but the meat is not in such general use as it is in America, where in some places it is so favourite an article of food that pork has been palmed upon the buyer for the genuine game of the forest and hill. Texas, up towards the frontiers of Mexico, where there are rocks, gorges, and hills, is a famous place for this sport, which is much prized by the Indians. These people, before fire-arms were much known amongst them, were as much afraid of a great black bear as the inhabitants of Algiers were of lions, until Giraud, the celebrated lion-hunter, made such havoc among these animals. The claws and skin of the bear were marks of bravery and naturally of rank among the red-skins, who selected their chiefs rather for their personal qualities than for their names. But now the rifle is common with the copper-coloured natives also; and in the most memorable bear-hunt we recollect, the Indians, by their knowledge of locality and the signs of the forest, played by far the most important part. We have, however, said sufficient, without narrating a personal adventure, to give our readers an outline and idea of this very favourite, though somewhat dangerous, amusement, all bear-hunts not being so comic as that of poor Friday in "Robinson Crusoe."

HUNGARIANS.

Although the brave struggle for Hungarian independence, which about five years ago attracted the attention of Europe and enlisted the sympathies of many ardent spirits, is now a recollection of the past, fading into oblivion through the all-absorbing interest of a yet mightier conflict, nevertheless a few words with reference to the Magyar race may not be altogether unacceptable to our readers. The illustration which we present to their notice is descriptive of a class belonging to what may be termed the working population of that race, and it is to this class that we shall chiefly confine our observations. It must not be supposed that there is any essential distinction between the noble Magyar and his less wealthy fellow-countryman. However diverse their present condition, their origin is the same, and their character radically identical. Of the two, the poor Magyar possesses even more interest for the traveller, as retaining more completely the traces of his original condition. He is a recollection of the ninth century living in the nineteenth. He has preserved the national costume—in all its purity, we were going to say—but it would be more correct to say, in all its barbarism and primitive impurity. Ten centuries have passed over this people without materially affecting their character. The Magyar of the present day is a worthy son of the ancient barbarian. His physiognomy, like that of his ancestor, is hard but full of expression. It combines nervous energy with great physical insensibility. Like his forefather, he wears his hair long and well greased, and for dress has a vest made of polished leather, which often serves him instead of a shirt, large trousers, and a sheepskin of many colours, called a *bunola*, which he wears with great dignity. Hardy and careless, he despises the population of cities, and would consider himself guilty of effeminacy if he were to avail himself of the various conveniences which modern improvement has introduced. He is the *lazzarone* of the desert, accepting thankfully the life which Providence has given him, and sleeping wherever he can find a resting-place—in a shed, under a waggon, or exposed to the sun, wind, and rain.

The poor Magyar can only be a tiller of the ground, a shepherd, a soldier, or a fisherman. For every other employment he has a profound contempt. He regards the soil with veneration and cultivates it with pride. As a shepherd, he passes whole months without going under cover. He may be seen wrapped in his large white cloak, seated Tartar-fashion by the side of the road, following with his eye the smoke as it ascends from his pipe, stroking his long moustaches, and leading a most contemplative sort of life. He has all the dignity of the oriental character. Like the Turk, he is grave in exterior and manner. Nothing short of a dance to the sound of his national music, or a plentiful potation of the wine of the country, is sufficient to excite him to activity. It is not, however, till after the cares of matrimony press upon him that he exhibits this gravity in perfection.

"In the East," says Madame de Stael, "when they have nothing to say, they smoke together, and bow to each other from time to time, with their arms crossed over the breast to testify their mutual friendship." The Hungarian acts in a similar manner. He is sober in his language, and never free with strangers; but he is frank and faithful, and if he finds a friend in you, will open his heart without any reserve.

HUNGARIAN BOATMEN.

LETTERS FROM CONSTANTINOPLE.—III.

——, 1853.

It is really wonderful to hear the details with which one is favoured on all hands in relation to the Russians in this city. Their cunning, their foresight, their intrigues, must have been something truly Machiavellian. The Russian embassy appears to have been a centre of operations of a very singular character. Money was no object. The minister had unlimited power of action, his subordinates looked upon him as a kind of deputy majesty. They were very numerous and existed under all forms. Russia never asked who a man was; all she required was, that he should be capable of doing her dirty work. Poles, Jews, Greeks, Italians, Maltese, Franks, were employed without scruple. They lived in every corner of the town. Their duty was to wheedle, to coax, or to buy over the officials, to get influence at any price, to seem to be the great protecting power, and to force weaker nations to appeal to her. The stories told of her duplicity and crawling patience are really incredible.

That the Turks gave her plenty of occasion to use her cunning, is no defence. If the Turks were weak, and had only made slow progress in the arts of civilisation, that could in nowise justify the acts of Russian agents.

The Turkish custom-house, based on the French principle, was an admirable institution for the Muscovite to work upon. Redschid Pacha, the head of the French party, had brought with him from France several notions by no means advantageous to the country or wise in themselves. He imported passports, a censorship, and an *octroi*. He it was that organised the custom-house. Like all other Turkish institutions the custom-house is badly managed, because its clerks are ill-paid. It is almost impossible for them to live on the pittance they receive. Here then was an opening for Muscovite fraud and cunning. The Russian embassy became at once the centre of operations of bands of smugglers and contrabandists. The Russian agents bought over certain officials, and by their connivance 4,000 bales of silk were passed as 400 bales of cotton, and other such nefarious practices carried on, to the great personal advantage of certain merchants, custom-house clerks, and Russian officials. Even during the festivals of Beizam and Ramadan, they could get goods passed with ease. Their influence was such, that the importation of Protestant Bibles was almost impossible. The censorship over books in the customs was held by a low Armenian, as no Turk could tell one book from another. The consequence was, that bibles, prayer-books, etc. were stopped, while immoral French novels, and all kinds of trash were permitted freely to pass.

The lower order of Turkish officers made money openly by fees, which they insisted on. A merchant who had just taken up his residence in Constantinople, once consigned a cargo of 447 bales of cotton to Alexandria. Before the ship could leave port, it was necessary that a *teskere*, or declaration that the description of the goods exported was correct, should be signed by some clerk. The merchant came to the custom-house, found the proper officer, and addressed him:

"Abdallah," said he, "here is my declaration. It's all right."

"Is it?" replied the Turk, taking it in his hand and looking at it upside down.

"I am quite sure of it," continued the merchant.

"Allah kerim! God is great! Think over it again, Christian. It's all wrong."

"I assure you, Abdallah, you are quite mistaken."

"I have said," replied the Turk, smoking his pipe with profound gravity.

The merchant went away in a great hurry, overhauled his cargo, obtained the written declaration of captain and mate, and rushed back. Near the bridge he met a friend. In his hurry he nearly knocked him down.

"Whither away so fast?" said the other, laughing.

The merchant briefly explained, and his friend laughed heartily.

"What is the matter?" asked the new arrival in Stamboul.

"My dear fellow, you will find, if you are not careful, that it is still all wrong. Did you give him a present?"

"No!"

"Then make haste and do it. That was all he meant. He was too much of a diplomatist to ask for it; but you give it, and try the effect."

The merchant thanked his friend, and entered the custom-house with a grave and solemn step.

"Abdallah," said he in a low tone, "you were right. There is something wrong; but I am in a great hurry, and cannot remedy it now. If you will look over it this time, why I will be more careful next."

And he dexterously slipped a small paper parcel into the man's hand.

"Mashallah!" said the Turk with profound gravity, after examining the amount with great coolness, "did I not tell you there was something wrong?"

The loss to the treasury by this system is immense; but now a searching examination promises to probe the evil and lead to a remedy. The coming of so vast a body of civilised Europeans to this place is producing its effect; and as Russian gold and Russian corruption are no longer at work—at all events so far as we know—there is some hope of a better state of things.

Passports, in a country where, out of Stamboul, scarcely a native official can read, are very provoking things. I have found them unpleasant enough in France, Italy, and Austria; but they are even worse here. The officials all pretend to be able to read them, and it is ludicrous to see a grave old Turk in a small village looking at your document upside down. On the road between this city and Adrianople, the soldiers of the guard-houses used to make a good thing out of them. They started coffee-shops in the guard-house. Under pretence of examining the passport, the traveller and servants were summoned inside. An order for coffee smoothed all difficulties, and you were allowed to proceed unmolested. Turkey, however, will now be opened up to the eyes of thousands of civilised travellers, and their suggestions will have weight with the government, which, I must say, seems decidedly to mean well, and would be far more liberal if it could. The priests of its religion, however, stand in the way of everything. The sacerdotal power is very great, and the ulemas, muftis, and others, by unfurling the flag of the Prophet, and giving money to aid the war, have gained singular popularity. This new power will be used to oppose everything enlightened, especially everything emanating from a Christian country.

But a large number of the Turks have seen through the delusions of the Koran, and only keep its outward observances because of the danger they would incur were they not to do so. There is a strange fact, which I have on the highest authority, and which explains many things. One or two influential Turks have, by the unscrupulous use of gold, been bought by Russia. Base men will be found in all countries, and though the Turk is generally strictly honourable and veracious, this may yet be believed. They, of course, pretend to work with the reformers one day, and with the conservatives the next, as Russia orders.

Turkish society is divided into the "Old Turbans," who still wear flowing garments, and are wedded to prejudice, hatred of the Christians, and every old idea of Islamism; and the "red caps and tight trousers," who wish to advance on the road of reform. In Stamboul they are pretty equally divided, though one day priestly influence gives predominance to the one, while the next, Western diplomacy raises up the other. There can be no doubt that recent events will give ultimate victory to the radical party in this country, and the radical party is that which will give equality in every form to the Christians. The right to hold property unmolested, is the one boon the Christians ask in the first instance. This will probably be conceded and carried out. It will double the wealth of Turkey. Now every Christian who makes money goes away. There is little doubt that when the projected reforms are carried out here, that Turkey will be able to defend herself, unaided by the Western powers. All she wants is a pure executive, good laws, and a wise system of finance.

PEERS AND M.P.'S,

OR,

LORDS AND COMMONS.

PARLIAMENTARY ORATORS AND ORATORY.

We now come nearer to our own times. We have been with the giants of English oratory—men whose names are familiar in our ears as household words. Our notices now must necessarily be scanty. We have already passed by many names well known in parliamentary annals. We can say nothing of Lord North, of Wedderburn, of Murray, of Windham, of Dundas, of Percival, of Wilberforce, of Tierney, of Lords Holland and Grey, and of Earl Wellesley, because these men, though they were statesmen, were not orators. They do not stand in the first rank. It was theirs to win honour in their age; it was theirs to command the applause of listening senates; but they have done their work and gone. Posterity will not ask for them again. We make an exception in favour of George Canning. Fortune favoured Pitt and Fox at their very birth; we now speak of a man who made a position for himself, who, born in an obscure rank, became the first man in parliament, and won that position by his splendid oratorial powers. Canning's humour was irresistible. Wilberforce went crying home with laughter, after his account of Lord Nugent's journey, to lend the succour of his person (Lord Nugent was not a light weight) to constitutional Spain. The passage is a capital specimen of the best-humoured political raillery. We give it entire. "It was about the middle of last July, that the heavy Falmouth coach (loud and long-continued laughter) that the heavy Falmouth coach was observed travelling to its destination through the roads of Cornwall with more than its usual gravity (very loud laughter). There were, according to the best advices, two inside passengers (laughter); one a lady of no considerable dimensions (laughter), and a gentleman who, as it has since been ascertained, was conveying the succour of his person to Spain (cheers and laughter). I am informed—and having no reason to doubt my informant, I firmly believe it—that in the van belonging to the coach (gentlemen must know the nature and uses of that auxiliary to the regular stage-coaches) was a box more bulky than ordinary, and of most portentous contents. It was observed that, after their arrival, this box and the passenger before mentioned became inseparable. The box was known to have contained the uniform of a Spanish general of cavalry (much laughter); and it was said of the helmet, which was beyond the usual size, that it exceeded all other helmets spoken of in history, not excepting the celebrated helmet in the Castle of Otranto (cheers and laughter). The idea of going to the relief of a fortress blockaded by sea and besieged by land, with the uniform of a light cavalry officer, was new, to say the least of it. About this time the force officered by the honourable gentleman, which had never existed but on paper, was in all probability expected; I will not stay to determine whether it was to have consisted of 10,000 or 5,000 men. No doubt, upon the arrival of the general and his uniform, the Cortes must have rubbed their hands with satisfaction, and concluded that, now the promised force was come, they would have little more to fear (laughter). It did come—as much of it as ever would have been seen by the Cortes or the king; but it came in that sense, and no other, which was described by a witty nobleman, George, Duke of Buckingham, whom the noble lord opposite (Lord Nugent) reckons among his lineal ancestors. In the play of 'The Rehearsal' there was a scene occupied with the designs of two usurpers, to one of whom their party entering says:—

> 'Sirs,
> The army at the door, but in disguise,
> Entreats a word with both your majesties'

very loud and continued laughter). Such must have been the effect of the arrival of the noble lord. How he was received, or with what effect he operated on the councils and affairs of the Cortes, by his arrival, I do not know. Things were at that juncture moving too rapidly to their final issue. How far the noble lord had conduced to the termination, by plumping his weight into the sinking scale of the Cortes, is too nice a question for me just now to settle." Loud cheers and laughter greeted this conclusion. Yet Canning's wit, while it sparkled and amused, seldom offended. Lord Nugent was long afterwards one of his warmest supporters. "Canning's drollery of voice and manner were," says Mr. Wilberforce, "inimitable. There is a lighting up of his features and a comic play about the mouth, when the full force of the approaching witticism strikes his own mind, which prepares you for the burst which is to follow." Neither Pitt nor Fox had this quality of humour. Mackintosh said of Canning, that he incorporated in his mind all the eloquence and wisdom of ancient literature. He thought Canning and Plunkett the finest orators of their time, and that Canning especially excelled in language. Johnson, speaking of Burke's *début*, says that probably no one, at his first appearance, ever obtained so much reputation before. "His immortality," said Grattan, "is that which is common to Cicero or to Bacon, that which can never be interrupted while there exists the beauty of order or the love of virtue, and which can fear no death, except what barbarity may impose on the globe."

Canning's speech on the North American Provinces was an era in the senate, wrote an M.P., applying what was said of the eloquence of Chatham, "It was an epoch in a man's life to have heard him. I shall never forget the deep moral earnestness of his tone, and the blaze of glory that seemed to light up his features." That fine sentence, in which Canning spoke of the part he had acted, must be familiar to our readers, "I called the New World into existence to redress the balance of the old." Canning took his stand not only between contending nations, but contending principles, in that marvellous speech. In its delivery, we are told, his chest heaved and expanded, his nostrils dilated, a noble pride slightly curled his lip; and age and sickness were forgotten in the ardour of youthful genius. All the while, says an observer, a serenity sat upon his brow that pointed to deeds of glory. Canning's remarks in vindication of himself, after the Liverpool election in 1816, ought never to be forgotten. "There is," said Mr. Canning, "a heavier charge than either of those that I have stated to you. It is, gentlemen, that I am an adventurer. To this charge, as I understand it, I am willing to plead guilty! A representative of the people, I am one of those people, and I present myself to those who choose me only with the claims of character, be they what they may, unaccredited by patrician patronage or party recommendation. Nor is it in this free country, where in every walk of life the road of honourable success is open to every individual—I am sure it is not in this place—that I shall be expected to apologise for so presenting myself to your choice. I know there is a political creed which assigns to a certain combination of great families a right to dictate to the sovereign and to influence the people, and that this doctrine of hereditary aptitude for administration is singularly enough most prevalent among those who find nothing more laughable than the principle of legitimacy in the crown. To this theory I have never subscribed. If to depend directly on the people as their representative in parliament; if, as a servant of the crown, to lean on no other support than that of public confidence—if that be to be an adventurer, I plead guilty to the charge, and I would not exchange that situation, to whatever taunts it may expose me, for all the advantages which might be derived from an ancestry of a hundred generations." Canning rose, wrote Eliot, the Corn-law Rhymer:—

> "He rose—a veteran proud of honest scars;
> He stood—a bard with lightning in his look,
> He spoke—Apollo had the voice of Mars;
> His form all hope from phalanx'd faction took,
> While flashed his satire like a falchion bared
> On all who meanly thought or basely dared:
> He spoke and died."

THE SPANISH DILIGENCE.

The days of diligences on the continent, like those of stage-coaches in this country, have well-nigh passed away for ever. Those cumbrous vehicles—which were a heterogeneous compound of coach, van, and waggon, and looked as if they were made up of a brougham, half an omnibus, and a coach all stuck together, with a sort of canopy over the whole—are now things of the last generation, and will soon become antiquarian curiosities. They have disappeared to make way for a much more rapid means of conveyance. Instead of the French diligence, with its *coupé*, *interieur*, *rotonde*, *imperiale*, we have the first, second, or third class railway carriage. But in Spain, the march of improvement is far less speedy. There, the antiquated mode of travelling still exists, not merely in mountainous and unfrequented districts, but along the principal roads through the country. Our engraving

A SPANISH DILIGENCE.

gives a good representation of diligence travelling in Spain. Those of our readers who may have gone from Boulogne or Calais to Paris in the old days of diligences will observe that, though we have here mules instead of horses, yet the general aspect of the vehicle, the postillion and the driver keeping up a constant gallop, and the clouds of dust rising on all sides, together make up a scene with which they are quite familiar. The following extract from the letter of a recent traveller, contains a lively and amusing sketch of the characters which figure in it.

"The names of the travellers have been called over; the postillion has mounted the foremost mule; the *mayoral* and the *zagal* have shared the box between them; the smack of the whip is heard, and we are on our way towards Aranjuez. The road is dreary, we cannot see a single tree, and as we are obliged to put up the windows to keep out the dust, which is thick enough to suffocate one, I will take the opportunity of describing our equipage. In the first place, we have eight, ten, and sometimes twelve mules, without guides, two and two. On one of the first pair sits the postillion; on the box is the *mayoral*, who drives the two wheelers; and by his side is seated the *zagal*. The *zagal* is the attached friend of the *mayoral*—like Pylades to Orestes, or Euryalus to Nisus. He is his right-hand man—his aide-de-camp. If a trace is broken, the *zagal* is down from his seat in an instant. If a mule falls or turns aside, or if it is necessary to whip the team and get them into a gallop, the *zagal* is the man for the emergency. He follows the mules, runs by their side, whips them, hollows at them, and addresses speeches to them, such as Automedon, the charioteer of Achilles, delivered to his horses. He calls them by name, puts them upon their honour, encourages and reproves them. At one time we hear him crying out '*Capitana!*' at another, '*Coronela!*' and when he has once got them into a gallop, he catches hold of the traces, jumps up at a single bound to the box, and takes his seat beside the *mayoral*, who has observed all he has done with a majestic impassive silence. The *zagal* is peculiar to Spain, and flourishes in no other soil. He is generally little, vigorous, and active. He spends his life in jumping up, getting down, and running along by the side; and I question whether, since the days of the Olympic games, when the wrestlers rubbed themselves with sand, it has been possible to meet with any one more dusty, more dirty, with the hair more firmly clotted by sweat and dust, than he is when, panting and exulting, he mounts the box, after running with the mules for a quarter of an hour."

LORD ABERDEEN.

Has our kind reader ever been in the House of Lords? If he has not, we must for once place him there. We will not detain him long—the lords meet for the despatch of business at five, or a little after, and generally break up a little before six. Generally a dozen lords make a good house, and half-a-dozen speeches are considered a very animated debate. On the benches on the left, are seated the Earl of Derby and Lord Malmesbury—on the opposite side are ranged half-a-dozen middle-aged gentlemen. These are her Majesty's ministers; there is nothing very wonderful in their appearance. They are very solid-looking men. Disraeli makes one of his lords say, the House of Peers looks like a "house of butlers." We don't go quite so far as that; but, certainly, if you imagine a lord is a much superior-looking and talking person to ordinary men,

THE EARL OF ABERDEEN.

you will be very much disappointed. Perhaps in the course of the evening, after chatting with the red-haired youthful Scot, known as the Duke of Argyle, an elderly, plainly-dressed, sedate gentleman, in excellent preservation, with a massive frame and head, will say a few words in the coldest and most unimpassioned manner imaginable, and you will see the reporters taking down every sentence as if it was worth its weight in gold. You are naturally anxious to know who the speaker is. If you ask, you will be told that he is George Hamilton Gordon, fourth earl of Aberdeen, and First Lord of the Treasury.

Statesmanship and longevity seem quite compatible. At any rate, they are so in his lordship's case. He was born in Edinburgh in 1784, educated at Harrow and at St. John's College, Cambridge, where, in 1804, he took the degree of M.A. But before then, his lordship had tasted the pleasures of foreign travel. Having succeeded to the title by the death of his father, while yet a minor, the young earl, in 1801, proceeded on a tour through the classic lands of Greece. That he drank deeply of the inspiration by which he was surrounded is clear from the fact, that when he returned, he founded the Athenian Society, the fundamental condition of which was, that no one should be a member who had not visited Greece. His lordship did more than this, he wrote a review in the *Edinburgh* of "Gell's Topography of Troy," creditable alike to his learning, to his power of observation, and his taste. This was enough for Byron, who was preparing to avenge himself, in his "English Bards and Scotch Reviewers," for the wrong he had received from the *Edinburgh*, and was doubly delighted thus to have a chance of gibbeting a rival author and a brother peer. Accordingly in his burning satire we read:—

> "First in the oat-fed phalanx shall be seen,
> The travelled Thane, Athenian Aberdeen!"

Aberdeen, however, did not take much harm from the ill-natured couplet, for in 1806, we find him elected as one of the sixteen representative peers which Scotland, by the Articles of Union, is entitled to send to Parliament. This honour he held till, in 1814, he was called to the British peerage by the title of Viscount Gordon.

Lord Aberdeen's *début* in public life was not a very brilliant one. For five years he was a silent supporter of Mr. Perceval. It was not till 1811 that he ventured to address their lordships, when he made his maiden-speech, by moving the address in the House of Lords, in answer to the Prince Regent's speech. Two years after we find him engaged in diplomacy. We were then at war with France. It was desirable, if possible, to get Austria on our side. This was a task of some difficulty, and Aberdeen was sent to Vienna to negotiate; for a long time Austria hesitated, but at length the councils of Aberdeen and Metternich prevailed. The former remained with the Austrian emperor till the conclusion of the war, and accompanied the advance of the Austrian army to Paris, where he signed the Treaty of Peace on behalf of England, on the first of June, 1814. Nor was this the only negotiation in which he was engaged. It was thought Murat, whom Napoleon had seated on the throne of Naples, could be weaned from the man to whom he owed so much. Aberdeen was employed to detach him, and succeeded. We have already mentioned the diplomatist's reward—he was made a peer of the realm.

Peace accomplished, his lordship retired from the stage. For this absence from public life two reasons may be assigned—his retiring disposition and his attachment to domestic society. Soon after he became of age he married the daughter of the first Marquis of Abercorn. That lady died in 1812. It may be, that to dissipate his grief and to obtain change of scene he entered upon public life. In 1815 he again became a married man, the object of his choice, this time, being the widow of Viscount Hamilton, and mother of the present Marquis of Abercorn; and possibly he may have preferred the language of the domestic hearth to the applause of listening senates. It was quite as well that his lordship thought so. Liberal principles were abroad, and his lordship was not prepared to support them. The people demanded—justly and respectfully demanded—reform, but his lordship was not prepared to grant it. An accursed alliance—blasphemously calling itself "holy"—had been established by Austria, Russia, and Prussia, for the purpose of keeping down their respective peoples by brute force, and it was understood that his lordship heartily supported it. Canning, as it was, had sufficient foes to contend against in that bitter struggle which ended in his death; and when Canning was deserted by the Tories, Aberdeen went into opposition with the rest. When the Iron Duke took office, with "No surrender to the liberal tendencies of the age" for his motto, Lord Aberdeen entered upon official life. This was in 1828. At first he was made Chancellor of the Duchy of Lancaster; but that office he did not hold long. He soon became Secretary of State for Foreign Affairs.

At that time considerable interest attached to foreign affairs. The battle of Navarino "an untoward event," as the ministry termed it, had just been won, and the Turkish fleet, for a time, completely destroyed. Don Miguel had seized upon the throne of Portugal, and when appealed to by the friends of Donna Maria, Lord Aberdeen refused to avenge her wrongs. More to his credit, however, was his non-interference, when the three days of July swept from the throne of France the Bourbons, to place whom there we had so lavishly poured out our treasure and our blood. This was right enough. But it was felt that the English foreign minister was too closely connected with the promoters of the Holy Alliance to sympathise with the people of the continent in their onward struggle for right and might. Whatever might have been his prejudices as regards the continent, his lordship, however, was compelled to bow to the spirit of the age at home. As a Presbyterian, we can imagine he shed no bitter tears over the abolition of the Test and Corporation acts; and though a Scotchman, he supported Catholic Emancipation, when it was found dangerous longer to refuse the boon. So far he deserved well of the country; but the time was coming when that country was about to refuse confidence in him. The question of reform had reached its maturity. Men were clamorous for it from one end of England to the other; a House of Commons pledged to it had been returned. The Duke of Wellington quailed, and Earl Grey became premier in his stead; of course, Lord Aberdeen went into opposition, but his opposition was not of a very active character. However, when the question of foreign policy was discussed, Lord Aberdeen was a severe critic of Palmerston and the Whigs. It is not clear that his lordship was altogether wrong. It is not clear the non-interference in the affairs of other states, for which he contended, was not the proper course to pursue. It is not clear that Palmerstonian policy always shines when contrasted with his own. These matters, however, must be reserved for graver pages than ours. Let us pass on to another incident in his political career.

In 1837, or thereabouts, the Church of Scotland was in a crisis. She had two great difficulties to contend against. Her machinery was unequal to the overgrown population of her towns, and her people were deprived of the power of choosing their own ministers. The church had asserted that right. The General Assembly of 1834 enacted, that while the lay patrons of churches should retain their right to present ministers, the communicants in a parish should have a right to say whether they approved of the choice or not; and if they dissented, their dissent, without cause, should be conclusive as to that particular appointment. That right had, however, been contested by the civil courts. But the assertion of it had won over the people to the side of their national church. The ardent and eloquent Chalmers fanned the rising flame. The people became zealous. Everywhere churches were erected. Government was asked to endow the churches thus liberally built; government, instead, issued a commission, which ended in a vague and unsatisfactory report. The Earl of Aberdeen took the matter up in the House of Lords. In a speech of considerable skill, evincing perfect knowledge of the subject in all its details, he set forth the claims which the Church of Scotland had upon the government, and strongly and pointedly censured the evasive course which the government pursued. But we must now return to the Veto question. The civil courts, one after another, had decided against the church; the House of Lords had been referred to as the final court of appeal, and that also had given a similar decision. In her distress and dismay, the Church of Scotland turned to Lord Aberdeen. It was true that, as a conservative and a patron, he had been opposed to the passing of the Veto law in the General Assembly; but his opposition had always been courteously conducted, and he had taken no part in the legal proceedings by which the nullity of that act was pronounced. Besides, he had shown his interest in the church by the speech which he had already made in the House of Lords. Accordingly, his lordship was requested to act the part of a mediator. His lordship undertook the task, and a long negotiation ensued. However, he might have saved himself the trouble. It appears the church leaders misunderstood him and he them. They went down to Scotland asserting that the reasons of the majority of communicants were in all cases to be valid, even though—to use his lordship's own illustration—the only objection they could urge against a man was that he had red hair; but when, in 1840, his lordship's bill actually made its appearance in the House of Lords, loud and bitter were the complaints his lordship's conduct had excited. He had betrayed the church, was the universal cry. Instead of allowing the majority of communicants to decide, the bill decreed that the presbytery were to be the judges, and might, if they saw fit, set aside the reasons given by the communicants as frivolous, and ordain the presentee, however ungrateful to the majority that act might be. The church leaders in the General Assembly declared that his lordship had deceived them. He, in his turn, defended himself in the House of Lords. The bill was scornfully rejected in the General Assembly, and was allowed to drop. It was well that it was so: one of the most glorious acts of modern times was the result. On one day, led by Chalmers, seven hundred ministers, consisting of the very flower of the Establishment, abandoned its altars, dear as they were to them, and became the Free Church of Scotland. The act was heroic. It was a

fine thing to find the old grand heart of Scotland beating as true to conscience and to God as ever. Far and near men sympathised and applauded and thanked God. When the question had lost its interest, Lord Aberdeen succeeded in carrying a bill founded on that of 1840; but it was too late, the partition had taken place, the national church had been rent in twain.

In the meanwhile Lord Aberdeen had again resumed official life. In 1841 a vote of want of confidence in the Whigs—the Whigs never seem to have confidence reposed in them—was carried by a majority of about ninety. Sir Robert Peel came into office, and Lord Aberdeen again became foreign minister. The result was a good understanding with France, with which country we had been on the eve of war, and the memorable visit to Eu, where Louis Philippe bestowed upon our foreign minister the flattering epithet of "*Ce bon* Aberdeen"—a phrase afterwards applied in irony to its object, when it became manifest that the wily old monarch, in marrying his son to the sister of the Queen of Spain, had overreached the English cabinet. While Lord Aberdeen was in office, he was also successful in bringing the Chinese war to a close, though he had disapproved of the steps which had led to the rupture. Another question, more important, was the definition of the boundary line between the British possessions in North America and the United States, both on the north-east and the north west. To settle the first, Lord Ashburton—better known as Alexander Baring, of the house of Baring and Co.—was despatched to the United States, with full power to conclude a treaty, by which it is to be hoped this question has been set at rest for ever. The north-west boundary, or Oregon question, was settled in an equally satisfactory manner. There was considerable bluster on the part of American statesmen at first; but at length a treaty fairly providing for the rights of all parties was happily negotiated, the ratification of which arrived in this country in 1846, just as Sir Robert Peel's ministry were quitting office.

We must say one word on this crisis. In 1846 the Anti-corn-law agitation became irresistible. Sir Robert Peel felt that it was in vain to oppose it. Accordingly, he resigned office; but as Lord John Russell was not prepared to form a cabinet, the Peel ministry, with the single exception of Lord Derby, returned to power, merely for the purpose of carrying through the repeal of the Corn-laws. Lord Beaumont, in the Lords, undertook to ask Lord Aberdeen how he could explain the anomaly of noblemen and gentlemen resigning office one day rather than carry through a particular measure, and the next resume office for the express purpose of carrying that measure. Lord Aberdeen stated that, as far as he was concerned, he had long been anxious to have the Corn-laws repealed. This reply so astonished their lordships, that they let the matter drop. The repeal carried, his lordship again retired into private life.

From 1846 to 1853 we seldom read his name in the entertaining columns of Hansard. Lord Aberdeen rarely spoke except when foreign affairs were debated. In 1850, on the Don Pacifico affair, he delivered a powerful speech against Lord Palmerston's intermeddling and mischievous and exasperating policy. The next year, when all England grew delirious with the fear of the Pope—when old ladies thought St. Paul's would be used for the celebration of the mass, and the fires of Smithfield would be again relit—he objected to legislative interference, and strongly opposed the Ecclesiastical Titles Bill. When, in consequence of their conduct in this matter, the Whig cabinet was *in articulo mortis*, Lord Aberdeen was sent for, with a view to the formation of a new one. In his speech in the House of Lords, February 28th, he stated that, in obedience to the commands of her Majesty, he had met Lord John Russell and Sir James Graham, and had discussed the basis of the proposed cabinet. On some questions they agreed entirely; on others, there was a probability of their accommodating their sentiments to each other; but there was one to which he had an invincible repugnance, namely, any penal legislation against the Roman Catholic subjects of her Majesty in respect to the prohibition of ecclesiastical titles. To any legislation of that kind he was opposed. No doubt the noble lord had proposed certain modifications; but all legislation of such kind must necessarily be inefficient. For two hundred years they had tried by persecution to limit the numbers of the Roman Catholics, and the only effect had been to increase them. But while deprecating legislation on the subject, he had not been the less sensible of the arrogant assumption of the pope and cardinals, though he did not think that afforded any grounds for legislative interference with the religious liberties of our Roman Catholic fellow subjects; and, therefore, he and Sir James Graham had declined to join Lord John Russell in the reconstruction of the ministry. Her Majesty had then requested him to form an administration; but when he considered that the Ecclesiastical Titles Bill was before the other House of Parliament, and had been approved of by a large majority, and that it would most likely meet with the approbation of a majority of their lordships, he felt that he must decline the task which her Majesty had been graciously pleased to impose on him, but to which he had never felt himself equal. Perhaps his lordship felt that the pear was not ripe, and that he could bide his time. At any rate he was wise in doing so. Lord John soon went out of office. Lord Derby then came in, and after his administration was utterly broken up, Lord Aberdeen became the head of the new cabinet.

The history of his administration has yet to be written. Composed of nearly all the ablest statesmen of the day, and based upon the broad principles of safe progress at home and peaceful policy abroad, it entered upon the responsibilities of office under most auspicious circumstances. Public feeling was strongly in its favour, every political section—save only the followers of Lord Derby—being represented in the government. The highest expectations of future improvement were indulged. That they have not yet been completely fulfilled, is rather matter of regret than surprise. No ministry ever yet succeeded in gratifying the wishes of all their adherents, and, in the present instance, untoward circumstances have occurred which no one could have foreseen or prevented. Against his will Lord Aberdeen has been plunged into war. It does not seem clear that his lordship's attachment to peace has materially impeded the successful prosecution of the war. But it does seem clear, that the fact of Lord Aberdeen's assumption of office was deemed by the Czar a favourable time for him to put forward claims, founded on fraud, and to seek to gratify an ambition not more disgraceful to himself than ruinous to the best interests of the world. It is to be hoped that Nicholas misunderstood the Premier. But his lordship is so calm and impassive a man—sits so still and says so little—that he is almost as much a mystery as the Sphynx of old. The real truth is, that, after all, it does not much matter who is the leader of the cabinet in the House of Lords. England is a democracy, with oligarchical institutions. The cabinet is but the National Executive. Your great statesmen often come from the democracy, as Peel and Canning did. It is, in the estimation of many, a misfortune to a statesman to be born a peer, and now Lord Aberdeen is too old to get over that defect. Why did Sir Robert Peel always refuse a seat in the Lords? Why was it the great Sir Robert Walpole said to his old opponent, Pulteney, whom he had pitched into the upper house: "Here we are, my lord, the two most insignificant men in the United Kingdom?" Why is it that Chatham shines on the historic roll as the great commoner? One answer does for all. The House of Commons is that which determines the decision of the senate. The House of Lords does little more than register that decision.

We may add here in conclusion, that Lord Aberdeen has never been unmindful of the claims of science and art. In 1812, he was elected president of the Society of Antiquaries, which office he resigned in 1846. In 1823, he appeared before the world as the author of a work on "Grecian Architecture," in which he criticises Burke's theory of the association of ideas in his celebrated "Essay on the Sublime and Beautiful." As lords are but rarely authors or critics, this of itself is something in his favour, though Burke still retains possession of the place of honour.

THE CHIMPANZEE.

Monkeys, from their human-like form and the ease with which they mimic many human actions, have attracted the attention of mankind in all ages. Nay, there have not been wanting those who, pretending to the title of philosophers, have maintained that man himself is only, as it were, a better sort of monkey, or at all events merely a creature produced by the more perfect development of the type of structure presented by the highest of these animals. The Chimpanzee, say the supporters of this doctrine, is by no means so far removed from the negro as to render the conversion of the one into the other at all impossible. But if we compare this creature, which is admitted by all zoologists to make the nearest approach in its structure to the physical conformation of man, with the very lowest and least intelligent of the human race, we shall find the differences so great, as vastly to outweigh the resemblances and render several intermediate gradations of development necessary, before we can arrive from the most man-like monkey at the lowest and most ape-like of human beings.

HEAD OF THE CHIMPANZEE.

HAND OF THE CHIMPANZEE.

FOOT OF THE CHIMPANZEE.

Like other monkeys, the Chimpanzee possesses four hands, that is to say, the hinder feet, instead of being fitted as in man for walking on the ground, are converted into hands to assist him in climbing trees, his ordinary place of abode being amongst the branches. He progresses, in fact, very awkwardly when in an upright position, as the sole of his foot cannot be brought flat to the ground, and he is obliged to walk merely on the outside of it, with his toes drawn up in a very cramped and uncomfortable position. The thumb of these hinder hands is by no means so perfect as that of the true hands of the anterior members; but even these, when compared with the same organs in man, will be found very inferior in point of perfection. The thumb is much shorter and incapable of being brought into those varied relations with the other fingers which enable the human hand to perform such a vast variety of operations with so much delicacy and precision. In the form of the head, too, the difference is, perhaps, even still more striking. Instead of the large cranium required to contain the brain of a human being, the adult Chimpanzee, like his congeners, has a flat retreating forehead, with a large ridge over the eyes for the attachment of the strong muscles of the jaws. In the young animal the forehead is higher, and the ridge just mentioned far less distinct, so that the creature has then a much more intelligent and amiable aspect than at a later period of its existence; and as most, if not all, the specimens which have been brought alive to Europe have been young, a false impression of their intelligence and docility and also of their external resemblance to the human race has

been produced, for it appears that when arrived at maturity they acquire, along with great powers of mischief, every inclination to employ them.

The Chimpanzee (*Troglodytes niger*) is a native of the west

THE CHIMPANZEE (TROGLODYTES NIGER).

coast of Africa, where it is said to attain a stature equal to that of man. Travellers who have visited these countries relate many curious stories of the chimpanzees. They are said to live in large societies in the forest, to walk erect, build huts to protect them from the burning heat of the tropical sun and from the violent rains which are equally characteristic of those regions, and to make use of heavy sticks or clubs in their combats among themselves or with the other inhabitants of the forests. They are also said occasionally to carry off negro women and children into the woods, and instances are related in which the people so abducted were detained amongst them for a considerable time. Most of these

extraordinary tales are probably, however, to be ascribed entirely to the imaginations of the natives, who would be very likely to invest an animal so nearly resembling the human race in appearance, with many of the attributes of humanity, and would certainly be by no means reluctant to relate these marvellous stories, perhaps with some extemporaneous embellishments, for the edification of credulous strangers.

Two thousand years ago, Hanno, a Carthaginian voyager, brought with him, on his return to Carthage, the skins of three specimens, either of this, or of the newly-discovered nearly-allied species, the Gorilla (*Troglodytes Gorilla*).* Under the name of "wild women," they, no doubt, made a great figure in the "yarns" of Hanno's sailors; and it is curious to find nearly the same term applied to them even in England in the present day; for a specimen, which was exhibited some few years since in this country, was honoured by its owner with the appellation of "The Wild Maid of the Desert," and doubtless endowed by him with many wonderful qualities.

It would appear from the evidence of trustworthy authorities that the Chimpanzee does not live in large communities, forming rude villages, but rather in pairs, building a rude habitation in the trees, at a height of thirty, or even forty feet from the ground. They feed on fruits, and on the bunches of young succulent leaves in the centre of the heads of palms, known as the "cabbage" to English settlers in warm climates. They climb with great ease, swinging themselves from branch to branch with astonishing agility. Their human-like form does not prevent their being eaten by the negroes, who regard a well-cooked Chimpanzee as an exceedingly palatable food, in spite of a tradition which is said to prevail amongst some of them, that the Chimpanzees were once members of their own tribe, but were expelled for the filthiness and depravity of their habits.

The Chimpanzee is thickly clothed with long black hair on the back of the head, the shoulders, and back. All the fore parts of the body are very thinly clad. The face is brownish and nearly naked. The limbs are covered with shorter hair than the back, and the hairs of the fore-arm are very curiously turned back towards the elbow. The arms, although long, are not so disproportionate to the size of the animal as those of some of the nearly-allied apes. The hands in the Chimpanzee only reach the knees when the animal stands upright, whilst in the Orang-Outang and the Gibbon, or Long-armed ape, they nearly, if not quite, touch the ground. The animal is quite destitute of a tail, and possesses only a trace of those callosities on the buttocks which form so prominent and disgusting a feature in many monkeys, especially the baboons.

In the adult Chimpanzee the canine teeth are very large and strong, and although not nearly so powerful, in proportion to the size of the creature, as those of some of the large baboons, they constitute most formidable weapons of offence, and an unarmed man would stand but a poor chance in a contest with one of these animals.

In captivity, especially when quite young, the animals are exceedingly docile, and imitate many human actions to great perfection. They will take their food with knife, fork, and spoon, and sometimes even appear to prefer using these implements, to conveying the food to their mouths with their hands. They drink from a cup or glass, like a human being, and occasionally evince a very human predilection for intoxicating liquors.

THE READING-ROOM OF THE BRITISH MUSEUM.

If the reader is of an inquisitive turn of mind, and has passed along Montague-place, Russell-square, he cannot fail to have observed a small iron gateway, with a sentry-box attached, through which gateway were constantly passing individuals of both sexes, some of them exceedingly seedy. These individuals are principally engaged in literary pursuits—that is, in the composition of new books by tremendous appropriations from old ones—and the place to which they resort is the Reading-room of the British Museum. Fortunately, there is no resurrection of old authors—once dead, they never again can be restored to life—so modern writers pillage without fear or shame.

Supposing for once you have got a ticket of admission—which is generally granted for six months, and which is easily procured from Sir Henry Ellis, the principal librarian, upon your written application, with a recommendation from some gentleman, whose position in society, reputation, or public appointment may serve as a guarantee for your respectability—you are at liberty to follow the individuals to whom we have already referred. The gateway passed, a few steps bring you to a door, which you enter, where you are civilly requested to deposit your walking-stick or umbrella, as the case may be. Having done this, and received a ticket for the same from the attendant Cerberus, a short flight of narrow steps, ending with a glass-door, at once conducts you to the Reading-rooms. They are two in number, and of considerable dimensions, measuring respectively 55 feet and 62 feet in length, by 36 feet in breadth, and are lighted from above, and warmed, during the winter season, by means of pipes. The tables, twenty-six in number, are arranged in such a manner as to leave a free passage down the centre and round the sides of the room; chairs are placed for the accommodation of eight visitors at each side of the table; and bookstands, pens, ink, and blotting-paper are gratuitously furnished for their use. The walls are lined with presses, containing a large and valuable collection of books of reference. The catalogues are placed upon shelves at a moderate height from the floor, those of the manuscript collections being kept distinct from those of the printed books. These rooms are open every day, except Sundays, Ash-Wednesdays, Good Friday, Christmas-day, and any Fast or Thanksgiving-day ordered by authority; except, also, between the 1st and 7th of January; the 1st and 7th of May; and the 1st and 7th of September, inclusive. The hours are from nine till four in the months of November, December, January, and February; from nine till five in the months of September, October, March, and April; and from nine till six in the months of May, June, July and August, with the exception, that on Saturdays in these last months it closes at five.

The Library owes its origin, in common with the Museum, as our readers are aware, to Sir Hans Sloane, of Chelsea, in 1753, and three years after was established in Montague House. It is said—but probably the statement is somewhat exaggerated—that Sir Hans Sloane collected together 54,000 volumes and manuscripts. Of these, 4,100 were manuscripts, consisting principally of medical and alchymical treatises, with the addition of a small collection of rolls and charters. In 1756 were added the magnificent libraries formed by Sir Robert Cotton and Lord Harley, together with the royal collections, extending from the time of Henry VII. to that of George II.; and from time to time constant additions have been made. The manuscript library has been pronounced by competent judges to be the most numerous, and probably the finest, in the world; the number of volumes at this time amounts to 34,434. The printed volumes, in May, 1851, were 435,000—by this time we may fairly suppose that their number has very considerably increased.

The first room appropriated to the readers was situated in the basement in the west corner of the building. Here they continued to assemble till 1810, when they were transferred to a larger and much more commodious apartment upon the second story, at that time forming part of the manuscript department. This state of things continued till 1827, when another transfer took place to two rooms situated at the southern extremity of the east wing of the new building, which were temporarily devoted to the service of the then rapidly increasing body of readers. In 1838, the erection of the north part of the present structure was brought to a completion, when the third and last change in the situation of the Reading-room was effected. Better rooms it is impossible to

* See Illustrated Magazine of Art, vol. i. p. 124; and Historical Educator, vol. i. p. 3.

have, though they are sometimes inconveniently crowded, and the bustle occasioned by the presence of so many persons makes one glad to get away, and gives to one's own quiet closet or studio, as the case may be, a double charm. How the public appreciate the advantages of the Reading-rooms the following returns show :—

	Number of persons admitted.		Number of persons admitted.
1843	70,931	1848	65,869
1844	67,511	1849	70,371
1845	64,427	1850	78,533
1846	66,784	1851	78,211
1847	67,525	1852	72,226

Such are a few facts and figures connected with what has been facetiously termed our "National Workshop." We cannot do better than close this short sketch with the following extract from the late Sir Harry Nicholas :—"The Reading-room of the British Museum," wrote that gentleman, "is in truth an establishment of which every Englishman has reason to be proud. It does honour to the country, and in the liberality of its regulations, as well as in the facility and continuity of access to its contents, it challenges a comparison with the public libraries of any other nation, and serves as a model, by which all public institutions in Great Britain, containing materials for the illustration of British history, ought to be regulated; but to most of which, however, it forms, alas! a striking and melancholy contrast."

AMERICAN SCENERY—SAVAGE AND CLASSIC.

In the contemplation of American scenery, we may, with advantage, turn aside from the consideration of its distinctive objects and features, to meditate upon the condition of its scenes, as affected or unaffected by the encroaching steps of man. We may regard them as savage, or classic, and examine their efforts separately in the formation of character. In doing this, we may pass the barrier of eternal frost and barrenness, or retrace the steps of civilisation till we cross its bounds. History and art, happily for us, have been faithful to their trust, and have done much to preserve the natural features of our country. It is to be hoped that art will do more, and receive and transmit fresh impressions of the West to posterity, before the hand of culture shall have changed the native face of things.

The savage scenes of America are varied and vast. Neither in the valley, nor on the mountain sides, nor yet on the prairie, has the toil of busy and all-subduing man broken up the solitude of wild nature. Savage scenes abound. When we speak of such scenes, we use the word "savage" in its natural sense—the unshorn earth. In doing so, however, we do not wish to be understood as saying, that by savage scenes we mean wild and terrible ones — such as would please the dark pencil of Rembrandt. They may be beautiful —spots where "the culprit fay" might find a seducing loveliness. They are the uncultivated places of the land—the untamed wastes of the earth.

Savage scenes, as thus defined, are rich and varied within our national domain. There is scarcely a river-head that does not know them. They line the banks of the rivers, they cluster along the margin of the lakes, and as noble studies, allure artists to the mountain-side. They have a noble mission, and like the solitary audience-chamber of prayer, are admirably fitted to cherish the sense of God in the heart, impress one with the mystery of being, and withdraw man from inordinate devotion to business and art. A gallery of them would do much to give grandeur to the American character. It would be a noble benefaction to the people.

The transition of savage scenery to classic, is, in that country, a pleasing object of study. It is gradual, and is made through the walks and hunting-grounds of the Indians. We cannot look upon them as an element of the classic. They are not the antecedents of the Americans. Neither do they belong to the savage. They are elevated above such scenes by human associations.

Indian scenes, as thus viewed, present some striking points of interest. They are peculiar, and belong to a transplanted Asiatic civilisation. The historic traditions that invest them, the wars that give them a bloody character, and the singular and strong sympathy that subsists between the Indian character and the primeval forests, furnish studies of no common interest for the statesman, the artist, and the educator. The Indian and the wilderness deserve a higher place in literature. The primeval homes of the red-man, rich in the traditions of his simple and daring life, are instructive subjects for freer pencils and pens than those that have yet touched them.

Thus, we are introduced to the *classic scenes* of America —scenes in which it is by no means poor, although they are a young people. Links of startling associations connect the cradle-homes of the States with savage and Indian spots, hallowed by endurance, stern faith, and the indomitable Saxon will; and the national birth with a patriotism and heroism almost free from the stains of wrong and unnecessary outrage that have marked the convulsions of the Old World.

When we speak of classic scenes in this connexion, we mean something more than a cultivated valley, or a garden reared on the hill-side. Culture alone does not make a scene classic. The savage scenery on the Willamete would not be changed, so as to assume this new character, by the addition of a hut, or even a mansion, adorned with all the appendages of comfort. A classic scene is one that has been raised above rude nature, and the walks of ordinary men, by noble deeds or associations—the deeds or associations of representative men, or those dear to fame. Such scenes have an instructive significance, and do much to form the character of a people. Plymouth Rock is a tower of strength, and to it the descendants of the pilgrim fathers will turn, as the Jews turned to Moriah. The birthplace and family residence and grave of Washington have a classic interest for them, which Stratford-upon-Avon never can have for England, nor Abbotsford for Scotland.

The classic scenes of that country, like all its other features, are distinctive. They are fresh, and gather about them, not the memories of extinct or crumbling institutions, but the associations of the first noble deeds of a free and hopeful people. Few traditions overshadow them in a cold and gloomy atmosphere of wrong and outrage. Few deeds of cruelty people them with the dread spectres of blood and superstition. Wyoming, and the fancies of witchcraft, and the trails of Indian warfare, are little more than the incidents that waited on their national birth. They are ennobled by deeds of heroism and the lives of true and honest patriots; by free and promising institutions, and by the recorded and living elements of a civilisation, in which individual man has gained his long-sought position, and is the central interest of the state. Humanity takes to itself institutions as things made for it, and goes forth in "freedom, loosened from the world," to render classic the scenes of its encampments.

At this point the principle with which we opened our remarks, and which pervades their several parts and illustrations, returns upon us. There is a formative power in the physical scenery of a country that impresses itself upon the hearts of the people, and imparts its distinctive features to their character.

This, we feel, is the point of greatest importance to the statesman and educator, and, if we mistake not, the point which the artist, in self-forgetfulness, should render prominent in all his lessons. For what are lakes and hills and forests, or their varied disposition in the wilds of nature, or on the canvas, unless they have a meaning for us—unless they represent to us the character of beauty and grandeur and power and happy relations impressed by God on our country and affected by our climate?

But how is the principle to be defined, and its application studied in America? We confess there are difficulties here. She has no historic antecedents to which she can look. The notions of the Old World grew up from barbarism, in the scenes which witnessed their subsequent civilisation. They grew up, too, in the gloom of spectral and crushing traditions, more hurtful to the mind than the malaria of untilled marshes to the body. They grew up in passive subjection to the forces of nature, and, in the early stages of their existence, peopled the woods and mountains with terrors that have ever haunted them like passions. Our cousins, on the other hand, entered upon their inheritance as a civilised people, armed from their cradle with scientific power to subject the forces of nature. They have grown up in free mastery over mountain and stream. The frame saw-mill is reared on the upland plateau, and beside the mountain torrent prepares timbers for the thunder-

A MANDAN VILLAGE. AN INDIAN SCENE ON THE UPPER MISSOURI.

ing car. As a natural consequence of this state of things, and the relation of their national character to their national inheritance, when they entered upon it, they are a people unusually free with nature. The rich, bold, varied, fertile, vast, and picturesque scenery of the country is transferred at once to the mind and heart, and is used with a restle s and inventive activity in building up a character strikingly distinguished by free, daring, individual action. The man and the resources of the man are about to be developed on a scale that will unite the distinctive features of Europe and Asia, and perfect them by the restoration of unity to the human race.

This train of thought, which we now draw to a close, we do not wish to be regarded as a descriptive survey of American scenery, or a critical comment upon its beauties and grandeurs. It is no more than an indication of these things—an introductory lesson on the influence of physical scenery in the formation of national and individual character. Definite and discriminated scenes are to be brought to view, as illustrations of this great subject.

We desire to preserve, at least, the memories and associations of American scenery as it has been, and enable subsequent generations to see the written and pictured shadows of the scenes in which the national character was formed. The childhood of a nation, like the childhood of an individual, originates its distinctive features. And as with the individual, the influence of external objects is greatest in infancy, so nations are most open to impressions from surrounding scenery in the earlier stages of their history. Nor can it be doubted that natural scenery is at all times operative upon national character, and generally for good. The truant heart of a people may be recalled from the engrossing cares of business and the sensuous shows of humbled and debased art, to their first love for the rivers and lakes and mountains of their native land, so much and so long forgotten.

> "O my native land,
> How should'st thou prove aught else but dear and holy
> To me, who, from thy lakes and mountain hills,
> Thy clouds, thy quiet dales, thy rocks and seas,
> Have drunk in all my intellectual life,
> All sweet sensations, all ennobling thoughts,
> All adoration of the God in nature,
> All lovely and all honourable things,
> Whatever makes this mortal spirit feel
> The joy and greatness of its future being
> There lives nor form nor feeling in my soul
> Unborrowed from my country."

These truthful sentiments of Coleridge cannot be read without emotion.

THE RAPIDS OF THE NIAGARA, ABOVE THE FALLS. A SAVAGE SCENE.

WASHINGTON HOUSE, MOUNT VERNON. A CLASSIC SCENE.

THE WATER-CRESS HOLLOW.

BY SILVERPEN.

It is a March day: after cold winds and drenching showers, the sun shines forth towards the afternoon, and throws a softened yellow light upon a little, furzy, solitary hollow. Round it runs a shallow rivulet fringed with trees, which flows into a pool half-hidden by budding alders and a dense hedge-row. A picturesque country lane leads to this hollow, and in it, midway, is a cottage.

It is a Saturday afternoon. The door is open to let in the sunlight, and a young girl sits by it at needlework; and in the distance, partly shaded by a tattered green baize curtain, is a bed, in which lies a poor bedridden old woman. Everything about her is exquisitely clean, and the content and cheerfulness on her serene face read like a text of Scripture wrought in human clay.

But that of the girl is full of sadness. She knows that the five shillings her brother Ben will bring home at nightfall will not suffice for a third of their wants. He is but a lad of nine years old, and the farmer who employs him will give him no more; her own necessitated attendance on her grandmother keeps her from earning more than a few weekly pence by washing and mending for the farmers' servants round. Thus they are very poor. To hide her tears—they are the deeper that her grandmother never murmurs—she takes up her work and goes out of doors, mechanically towards the Water-Cress Hollow. Even *she* thinks it beautiful; she sits down on a stone, and sees that the primroses begin to peep, and that the water-cresses grow fast in the limpid pool.

As she sits she hears a horse gallop down the lane, and stay before the cottage door. She hastens back, and finds it to be one of the ducal servants from the great abbey near. He is a decided Plush of the first water, and throwing his horse's bridle over the garden wicket, has already entered and ensconced himself in an easy chair.

"Miss," he says, addressing her as she enters, "part of the family be at the abbey, and cresses is wanted for a salad. Gardener says there be some hereabouts. If so, get them, and be quick, for dinner's early to-day."

"Yes, sir," replies the girl, "there are plenty. I'll get them directly, sir."

Mr. Plush likes to be sirred, and takes snuff with great complacency. The girl departs, and soon returns with a plentiful bunch of cresses.

"Shall I carry them to the abbey for you, sir?" she asks.

"No, no, thank you. Our cooking monsure is, as usual, in a hurry. But you *can* paper them, or put them in a small basket, if you like. A gentleman doesn't like to carry *such* things in his hand."

A very small basket is found, into these they are crushed, and Mr. Plush asks what is to pay. The girl is about to say that he is welcome; but Mr. Plush, thinking he may as well behave aristocratically—for the "sir" has mollified him immensely—throws down a shilling and takes his departure. But when he has ridden a few yards, he returns for an instant.

"Girl," he says, "you might be looking up our way every morning whilst the family is here. Unlike me, they have a taste for them things."

The shilling is an El Dorado, and confers marvellous happiness. The bedridden grandmother will now have her ounce of tea, some fresh butter, and a rasher of bacon, for they have been too poor to keep a pig the past winter.

"Grandmother," says Nan; for that is her name—"I did not know gentry cared for these poor sort of things."

"Oh, yes, my dear; cresses be partic'lar good in salad. Why, if we lived anywhere nigh Lunnon, that pool 'ud be a fortin to us. For poor and rich buy 'em there—and folks as be gardeners, grow 'em in ponds, nigh all the year round."

"What, do poor folks like 'em?"

"Ay! that they do, Nan. Many's the pen'orth I've seen—when I lived in sarvice in Lunnon—working men carry home to their wives on passing by from work at evening time—partic'lar a night like Saturday."

"Well, they dunna buy and sell 'em i' these parts."

"No; I supposen none 'a thought it worth their while to take things to market as be had for gather'n. Though I canna see how the pit and forge folks a' time to be seek'n places like our hollow. Ay; it be a pretty place as any for miles; and thy grandfay'ther as built this cottage on the waste, was nigh ask'en my Lord Duke to let it go with the holding."

A thought has struck Nan, and she at once proceeds to make it practical.

"Grandmother," she says, "I think, as I 'an time to-night, I'll go down Oaken Gates way for thy bit o' tea, for Timmis's i' th' shop be so bad. I'll make the fire, and put the kettle by, and Ben can make thee a cup o' th' leaves i' th' pot, if I ba'int back before thee need it."

The old grandmother dissents at first, for the Oaken Gates lie some miles off; but presently remembering how cheerfully Nan assents to all *her* desires, she bids her go. The kettle is, therefore, soon on the hob, the tea-cups set, her shawl and bonnet on, and she is off. She has said nothing about her real intention, but taking a large basket from an out-house as she passes by, she proceeds at first to the water-cress hollow. Here she partly fills it with cresses, plucks carelessly a lovely tuft of primroses as she passes by—for she is very fond of flowers—and then returning quietly up the lane, proceeds with rapid steps on her way. As she expects, she meets her brother Ben, tells him her intent, and bids him "keep grandmother easy if she be a bit late, but not to tell her errand."

When she gains the great pit and forge district, forming a part of Ketley, and so running on for miles, the men are beginning to stream homewards from work; lounging as they come; most of them disappearing in the beer or truck-shops, whilst others stay to make purchases *at any price*—so that they have a luxurious meal on the morrow—at the shops, and stalls, and carts, which line the endless street of dirty-looking houses. There is a crowd everywhere; men and lads, women and children; all are thronged together in the lurid blaze cast down from the forges and the paler gas-light. The girl takes her stand with her basket in the quietest spot she can find, but where people pass to and fro to butchers' carts and hucksters' flaring stalls. She is soon noticed; children crowd round to see what her basket holds; pitmen's wives on their way to the truck-shops, stop to question her, and the men joke as they pass by.

"This be something new to bring to market," says a forgeman's wife.

"Ay," cries a black-faced collier, "they be a bit cold, I take it, and would n'a do for me." But some buy; some stop to look at her comely face; some drop a penny in her hand, but take no value. In a short time Nan has a heap of coppers in a corner of her basket.

"Well, lass," says one young collier, who is about to step into an adjacent beer-shop, "thee'st coome far, I reckon."

She tells him she has; and by degrees, as he questions her, goes on to speak of Water-Cress Hollow.

"Well, gi' me thy last cresses, for thou has n'a many I see, and I'll take'm home to my old woman—aunt she is—in m' han'kercher; and here, tak' this, a bargin's a bargin."

Nan refuses, for the money is sixpence.

"Nay! tak' it, lass. It'll only go o'er the bar o' the Red Lion if thou hasn'a it; but if thou hast, both on us'll be the better for't. Nay, tak' it, and let me hav' thy posy." He gathers up the scattered primroses from the bottom of the basket as he speaks.

"But ain't it a pity," she says—for she likes his good nature—"that thou goest to the Red Lion at all? Grandmother says that beer-shops be the ruin o' th' pit folks; for there they spend their money and learn the road to sin. So go home wi' thy cresses, and keep thy money."

"Not to night, lass; there's Jones and Smith, and our butty, Harris, 'spectin' me." So saying, he nods and departs. Nan, weary, now prepares to go, for her basket is

empty, and she has cleared two shillings. She purchases the tea and bacon, and pays the first weekly instalment towards a blanket her grandmother has so long wanted, and which, as she is known, she is allowed to take home. It is late when she reaches there; but joy and surprise soon banish anxiety.

Now, week by week, Nan attends the Saturday night's market, as well as supplies the Ducal Abbey with cresses; but in a little while her supply in the hollow begins to get scant. She is in some consternation, for the weekly pence brought in have proved quite a help and blessing. Another bright thought at last crosses her mind. So she mentions the matter to one of the under-gardeners at the abbey, an intelligent Scotchman, whom she has often encountered in going thither.

"Can you read?" he asks.

"Yes, sir; father was one of the Duke's colliers, though killed i' th' blast of a pit, and so I went to my lady Duchess's school, till grandmother needed me."

"I'm glad of it, for I can lend you a book where you will see how gardeners, near London, keep cresses in stock nearly all the year. What's more, if you want a bit of help at any time, come to me."

But she does not like to trouble anybody; so she puzzles the matter out for herself; dams up the rivulet here, lets it flow there, sets shoots in the moist earth, attends to them whenever her grandmother can spare her, and, by good luck, has soon a fresh crop ready.

She has been absent from the Saturday night's market for some weeks; she now goes again. She misses the young collier, and, whilst selling her cresses, inquires after him.

"Oh! he's bin in jail these three weeks; and h'an just got a sentence for six more. The matter came out on a brawl at th' Red Lion, for he's a sad chap to drink. Ay, it be a pity; his aunt takes sadly on about it, for his bit o' pay be all she h'an to keep her."

"Where does she live?"

The collier, whom Nan has thus questioned, points to a gully down the narrow street in which they stand.

Here, in a miserable tenement almost destitute of furniture, she finds a better sort of old woman, cheerful, clean, but very poor. The girl's visit is made under the kind plea of taking her a few cresses, and they talk, as a matter of course, of the absent man.

"Eh! it be a pity, for Dick's a good lad, and earns a deal of money; but the drinking spoils him. If it were na' for th' beer-shop, he'd be sich a lad as ain't i' these parts. But I'm hoping th' gaol 'ill be teaching him a lesson; for he took on mightily to go, most because not o' seeing thee, these Saturdays."

"Me?" interrogates Nan.

"Ay, thee; he says he loves thee as he never loved afore."

"Well," replies Nan, "if I did think anything o' marrying and leaving Ben and grandmother—which I don't—it wouldn't be to him, as wastes his money in drink."

"Thee art right, lass; but Dick does love thee, and may be thou'lt hearken a bit to him, if only for the sake o' making him better."

Nan makes no promise; but she never comes to market with her cresses but she visits the old woman, and takes her some trifling present. When Dick is liberated, he is ashamed at first to meet Nan's honest gaze; but by-and-by, as he gets to work, he takes courage, and at last tells his love.

"Nay," replies Nan, "I'll have nothing to do wi' thee whilst thee drinks and wastes thy money in beer-shops."

"I won't, I tell thee again, though I must h'an a pint sometimes."

"No, that won't do—one pint begets another. Let me see thee save thy money afore thee talks of marrying."

She is firm, and will have nothing further to say to the young collier. He can bear this no longer than a few weeks; so on Saturday nights he brings part of his wages, and bids her keep it for him—it is the part he would otherwise spend at the Red Lion. She does so with beautiful and quiet faith, and her good influence grows: there seems reason to think that Dick will eventually become a sober man.

In the meanwhile, the rector of the parish and his wife—both of them enlightened and excellent Christians—hear of the young girl's industry, in trying to cultivate the Water-Cress Hollow. They have already noticed, in visiting her grandmother, her modest and excellent conduct. Without saying a word, they drive over to the Water-Cress Hollow and inspect it for themselves, and are astonished at the skill and industry with which she has cultivated the little marshy brooklet. Dining some few days afterwards at the Duke's table—for the ducal family, inclusive of Mr. Plush, are again at the abbey—they mention this little fact to the Duchess, who repeats it to the Duke. His Grace, who is an excellent landlord, and likes to give encouragement to his tenantry, sends down his steward to inspect the Hollow; and the result is, that both it and the adjacent strip of land, which joins it to the cottage garden, are let to Nan at a merely nominal rent, and a gardener is employed to dig, trench, and make it fitting for the growth of such vegetables as are likely to meet with a ready sale among the collier and forge population. But the Hollow, much to Nan's delight—for it is a lovely spot—is left in its primitive state, save for the better cultivation of the brooklet cresses. It is impossible to describe the girl's delight, or that of her grandmother—more especially as there will be work enough at home for Ben now, and with some few hours to spare each evening, so that he may go to the night-school of the district.

A year passes by. Nan and Ben have worked hard, and the produce of their large garden is now carried twice a week to market in a donkey-cart. It meets with a ready sale, for Nan has become known and is a favourite.

Dick, in the meantime, has grown steady, though he *does* break out now and then, and Nan has saved several pounds of his heretofore wasted money. Its value is now seen. There is a terrific explosion in the pit in which he works, and he is seriously injured; and for many weeks lies a cripple on his bed. The little money which the girl has saved, she now returns with noble faith; and when it is spent, assists him and his poor old relative with some of her own. When Dick does recover, it is found that he is no more fitted for pit work; but the good rector places the matter before the Duke's steward, who gives him work of easy superintendence at the mouth of the pit, and promises him a better place if he will keep steady, and add, through attending the adult school, further to his knowledge of reading and writing.

Matters thus progress for two years more. Nan's garden is wonderfully productive, and she has been enabled to save money. Dick, too, has become thoroughly steady, has improved his little learning, and been promoted to the place of overseer to several pits, at good wages. There is nothing now to defer his marriage with Nan, excepting that the Duke has promised to build them a good cottage on the prettiest upland of the Water-Cress Hollow. This is done—and they are married.

The old grandmother and aunt are now both dead; but young children, well trained, supply their place. Ben is unmarried, and lives happily with Dick and his sister, and has become quite a scientific gardener.

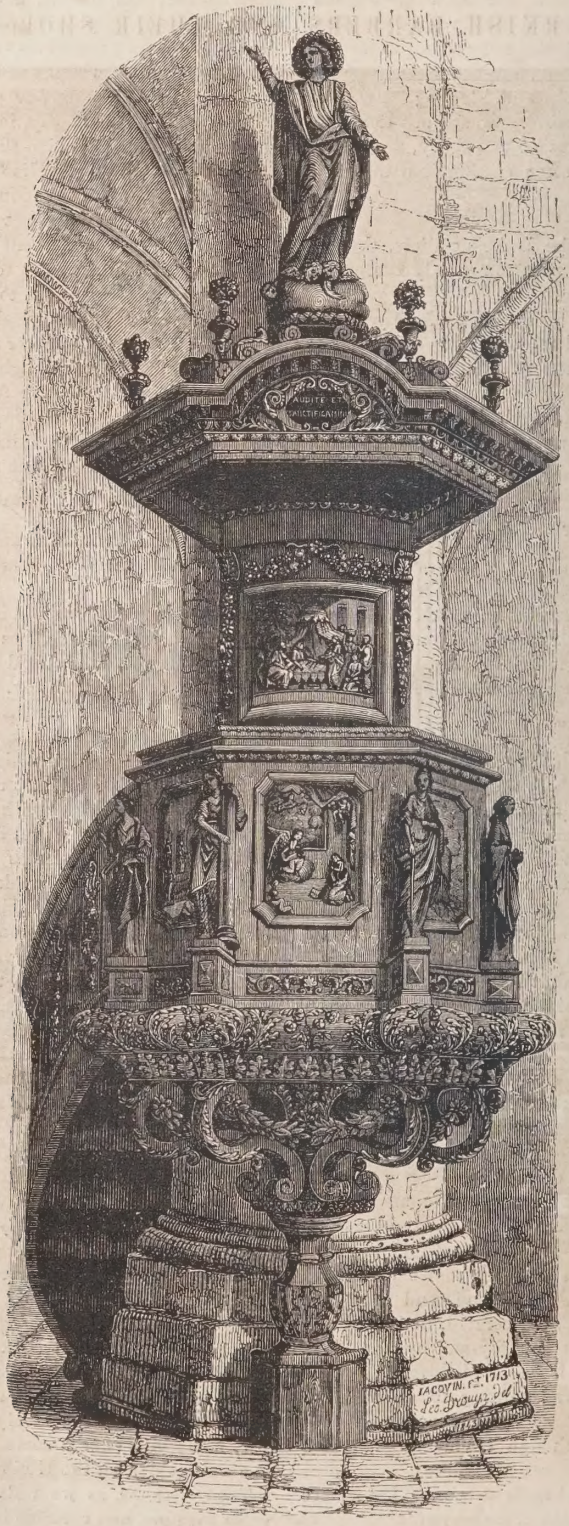
Indeed, reader, if you were here with me in this region of coal-pits and forges, I would take you with me to the Water-Cress Hollow. We would go in the evening of these sweet spring days, just when Dick has returned from his work—a long walk of five miles; when Ben sits reading in the sunny porch, and Nan prepares tea. We would take a cup. We would walk round the lovely garden and gather some daffodils, some violets, and some polyanthus; and wait to see the sun sink golden on the Hollow.

Then, perhaps, as we walked homewards, you would converse with me, and coincide in my idea that sobriety is one of the great practical wants of the working population; that as it increases, their moral and physical blessings will progress too; and that no object, however humble, is to be despised, for industry and knowledge may find in it the means of honest and honourable independence.

THE PULPIT AT LIGNY.

One of the beautiful specimens of art to be found in Roman Catholic churches is the pulpit represented in our engraving. It is in a church at Ligny in France, and is of carved oak.

On the top is seen the Virgin Mary borne by angels, representing the Assumption. The four statues which adorn the angles of the pulpit are about two feet high. They appear to represent



PULPIT AT LIGNY.

The carver was Jacquin of Neufchateau. It is sexagonal in form, vigorous in style, and about seventeen feet in height.

Prudence, Power, Justice, and Plenty. On the panels are six bas-reliefs, portraying the history of the Virgin—her birth the Presentation in the temple, the Annunciation, the Visita-

tion, the Presentation of the Saviour in the temple, and the woman bruising the serpent's head. It is to be regretted that the heads of these bas-reliefs are mutilated and three statues of angels destroyed, one at the foot of the pulpit stairs, and two others near the Virgin, to whom they were presenting a crown. The remaining statues are in good condition, but the whole pulpit appears to be hastening to ruin. It has been found necessary to prop it up with iron bars.

TURKISH BARBERS AND THEIR SHOPS.

INTERIOR OF A TURKISH BARBER'S SHOP.

Barbers' shops in Turkey are coffee-houses, but these coffee-houses are no more like ours than their occupants resemble our Figaros. Four walls without paper, sometimes ornamented with arabesques, but more frequently whitewashed; a large high window-frame; a wooden ceiling with mouldings and designs in a strange style; an inlaid floor covered with mats to wipe the feet; a wooden bench running along both sides of the shop for persons of greater consideration; or an elevated

platform at the end covered with cushions and carpets; or sometimes small wooden seats before the door, from which the customer may get a good view of the country and what is going on outside; in the way of furniture, a stove where are prepared the coffee, sherbet, and other drinks allowed by the prophet; a collection of chibouks, pipes, narguillehs, and perfumes; a small fountain playing in summer, and a chafing-dish with a heap of coals burning in winter; the master of the place calmly setting an example to the smokers and drinkers; and his Armenian assistants attending to the customers with the utmost possible deliberation—such are the principal objects and characters which together make up the scene usually presented to an observer on entering a Turkish barber's shop.

Some of these establishments are distinguished by greater splendour and importance, and are really elegant models of Byzantine architecture. This is the case with that depicted by our artist, but such instances are exceptions to the general rule.

On entering a Turkish barber's shop, the first thing to be done is to take off one's shoes or slippers. You then squat down on a mat or climb up into a stall of the wooden seat which runs along the sides of the shop, and is covered with cushions. They bring you a pipe and a cup of coffee; the pipe is as large as the cup is small. You fill the pipe again and again, and take as many cups of coffee as you choose. The Moslems carry out the precept *festina lente* (hasten slowly) to perfection. There are some who spend two hours in emptying a chibouk, drinking in the mean time fifteen or twenty cups of coffee.

When you have finished smoking and drinking, the barber's man comes up stropping his razor on the leather attached to his girdle. He then covers your face with the lather and commences operations in good earnest. Beware of opening your eyes, and breathe through the nose if you can—if not, you will stand a good chance of being stifled, for the performer is as slow and impassive as he can well be. He passes his razor over your skin with as much indifference as if he were scraping a board. He seizes you by the nose, the moustaches, and the hair; knocks your head against the wall; turns it to the right, to the left, forward, and backward; pulls and pinches your cheeks; and cuts the beard down to the flesh, passing over it again and again without paying any more regard to the blood which he sheds than if he were a butcher skinning a sheep. If you groan, he is deaf; if you cry out, he does not relent; if you struggle, he heeds not; and if you storm, he says not a word. All you get for your pains is to be held still tighter, handled more roughly, and grazed and gashed more pitiably. At last you are out of your misery, and you see your executioner wiping his razor between his finger and thumb. He makes you a slight bow as he shakes his fingers, at the risk of bespattering you with soapsuds; after which, taking out a new implement from his bundle, he catches hold of your ears, pulls them out, blows in them so as almost to deafen you, and then picks them as a cook would scrape the bottom of a dirty saucepan.

For a European, the crisis is now over; nothing more remains to be done but to look at himself in the glass which is brought him and give repose to his distorted muscles by smoking a final pipe, accompanied by a few draughts of coffee.

But in the case of a Mussulman, the operation is only half over. After the face, the head must be shaved. The reader will see in our engraving a sort of funnel hanging over the head of the patient. From this the barber pours a stream of tepid water over his head and face. If the poor wretch is drenched, that is his look out. The man gives him a basin in which he must catch the cascades as he best can. Now, as he is compelled to shut his eyes to keep out the stinging soap and water, the pretended reservoir only receives a few drops, while the rest goes over the tunic and the trowsers. But the Mussulman resigns himself to his fate. It was so ordered, is his remark, and this notion carries him safely through all his troubles. When the head is shaved, the barber perfumes it with scented oil and gives it the polish of a new doll. The pipe and the coffee conclude the whole business.

It is related of an Englishman who was staying in Constantinople that, on going to get his hair cut, he was horrified to find they had shaved his head before he could avert the calamity, and ran in a great fury to an officer of the police who was smoking in motionless silence at a coffee-house. The *civis Romanus*, as Lord Palmerston would say, laid his complaint before the official with no lack of words and plenty of vehement gesticulation, and concluded by calling for summary vengeance upon the offender. There was not a word of reply. He raised his voice to a higher pitch, he swore, he stormed. Still no answer. Yet the officer understood him, for he spoke in French, as he had been brought up in Paris. At length the Englishman, driven to distraction, vowed he would go and inform the English ambassador, the matter would be brought before the Sultan, and Great Britain would demand satisfaction. To all this there was no more answer than before. The officer merely uttered an exclamation between two whiffs—a sort of *pish!*—and then sank back into his impassive state. The Englishman, struck with astonishment, ran off, but whether he ever obtained redress, is more than we can pretend to say.

JAPAN AND THE JAPANESE.

The enterprise and energy of the American people and government bid fair to make Japan ultimately as well known as our own Indian provinces. But at present it is comparatively unknown; the Dutch having by no means exhausted all that might be made public relative to this country, which, while owing something to its mystery, is likewise of itself interesting. Instead of waiting for the day, then, when we shall have yacht voyages to Nippon and Kiusiu, as we have yacht voyages to Texas and China, we continue to give our readers, from the most recondite and best resources, some account of Japan as it is known. As the materials exist almost exclusively in huge and expensive Dutch works—a language not so familiar to the general public as French—our information must prove valuable.

The social, political, and religious characteristics of the country are very curious. It does not appear that their present seclusion has been a thing of all time. The timidity and mystery of the rulers of Japan is of modern growth. During the days of early intercourse, it was marked by high-bred courtesy on their part, combined with refined liberality and hospitality, without questions as to circumstances, rank, calling, or nation.* When a governor of the Philippines was wrecked and destitute, they at once treated him according to his rank. He was received with princely honours, which were continued during his residence. Every assistance was given him to depart. The poor boy Adams, who was wrecked there, rose from the state of "apprentice to master Nicholas Diggines of Limehouse" to be a prince in Japan. He became the counsellor and friend of the monarch. For a whole century trade was free and unshackled, and profits were enormous. The amount of gold and silver sent home by these traders was very great.† The missionaries succeeded in making two million converts to Christianity. They were allowed to build temples and to teach the tenets of Rome. Toleration was extended to the religion of Budha, the votaries of which now outnumber those of Sinto. There are

* See "Memorials of the Empire of Japan in the Sixteenth and Seventeenth Centuries," edited, with notes, by Thomas Randall. London: for the Hakluyt Society.

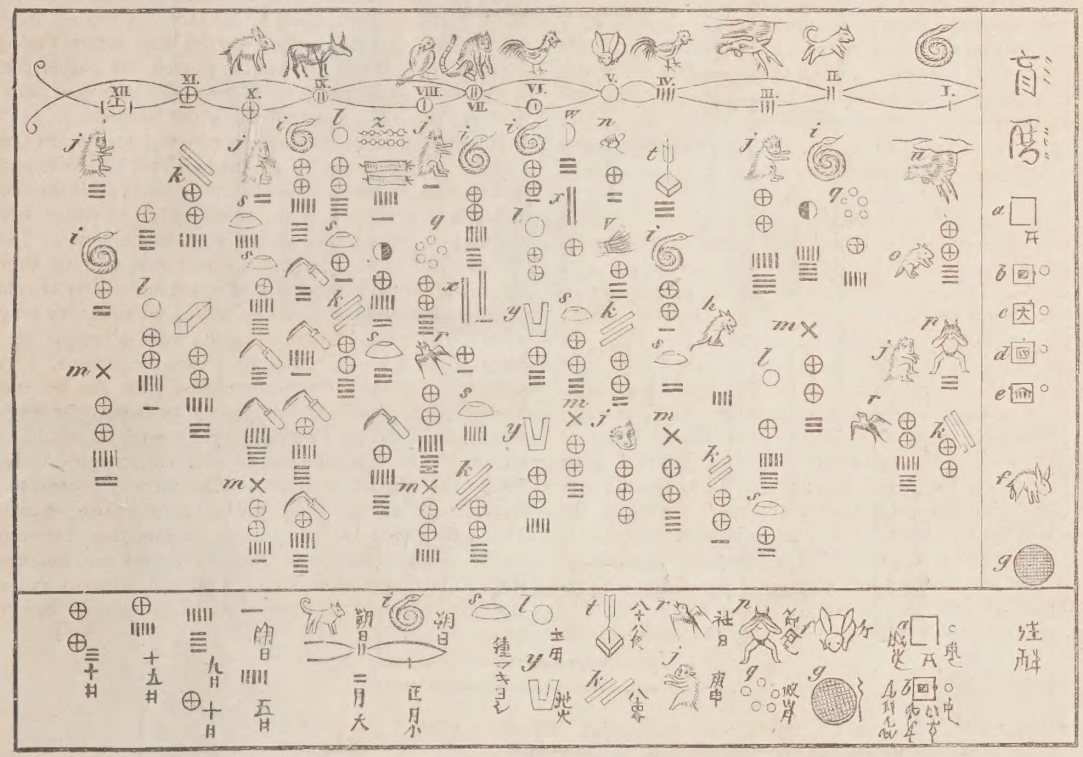
† See "Summary of the Narrative of Don Rodrigo de Vivero y Velasco," in Appendix to Memorials, etc.

besides thirty-four other sects, which are all tolerated and live in great harmony. Adams never recanted from Christianity. The English and Dutch factors were kindly used. But the Spaniards and Portuguese opposed with great energy the presence of rival nations. They declared the Dutch to be rebellious subjects of Portugal. Minno-motto-no-yes-yeas, or Gongin Sama, the emperor who gave privileges to the English, always refused to listen to the intolerant Portuguese, declaring that all people were alike to him, and that Japan was an asylum for people of all nations.* A change has since taken place. The government of Japan is now exclusive and barbarous. But the change may be explained.

The Portuguese first visited that empire in 1542; the Spaniards a little later. In 1587 occurred the first disagreement. The Spaniards interfered too much with religion; while the Portuguese stole some of the Japanese and sold them as slaves, and also ate the flesh of oxen and cows, which was offensive to the Japanese. The Portuguese tried to explain, but with little success. A decree was published, expelling the missionaries, and pulling down all crosses. But

In 1805 the Japanese had the pleasure of becoming acquainted with Russia. At the suggestion of Count Resanoff, two officers of the Russian imperial navy, named Chowstoff and Davidoff, made a descent on one of the Kuriles. They landed within territories dependent on the government of Japan, inhabited by Japanese subjects, and governed by Japanese authorities. Pillage, slaughter, incendiarism, and crimes of every hue, marked their track. They took away many prisoners, and threatened to return.

On the present state of affairs there is a curious extract to be made from a native writer.‡ He says:—"The ancients compared the metals to the bones in the human body, and taxes to the blood, hair, and skin, that incessantly undergo the process of renewal, which is not the case with metals. I compute the annual exportation of gold at about one hundred and fifty thousand kobars: so that in ten years this empire is drained of fifteen hundred thousand kobars.§ With the exception of medicines, we can dispense with everything that is brought us from abroad. The stuffs and other foreign commodities are of no real benefit to us. All the gold, silver, and



ALMANACK FOR THE BLIND.

the decree was very nearly a dead letter. It was, however, to the over zeal of the priests that the exclusive system was entirely due. Christian revolts took place, which were put down with a ferocity and cruelty unexampled in the history of the world. The Dutch, too, succeeded in persuading the government that the Portuguese meant to conquer the empire. All Christian nations were thereupon expelled, a price was put on the heads of priests and Christians, and Christianity banished. All natives were prohibited from leaving the country, under penalty of eternal exile. Japan was, to use Kœmpfer's phrase, shut up.†

The Dutch have retained their position by the exercise of the arts of patience and submissiveness. The English retired honourably from Japan in 1623, and then sent a mission in 1673; but Charles II. being married to a daughter of Portugal, it failed.

copper, extracted from the mines during the reign of Gongin (Ogosh-Sama) and since his time, is gone, and—what is still more to be regretted—for things we could have done without."

There may be two opinions on this point, as the Japanese appear very much behindhand in most of the arts of civilised life. Still the country is rich. There is an extensive and lucrative trade between the provinces. Extensive tracts of land, each with its own climate and its own peculiar productions, separated from each other by ranges of rugged mountains, by impervious forests, or by broad arms of the sea, promote an immense coasting trade, by which the various productions are disseminated and circulated, to the great comfort of the population and the no small gain of the trader.

One of the means of transport is represented in our engraving, (p. 505), which portrays the bearers who carry goods over

* See Charlevoix "Histoire du Japan," t. iii. ed. 1754.

† See Kœmpfer, vol. i. p. 317—18.

§ £2,500,000.

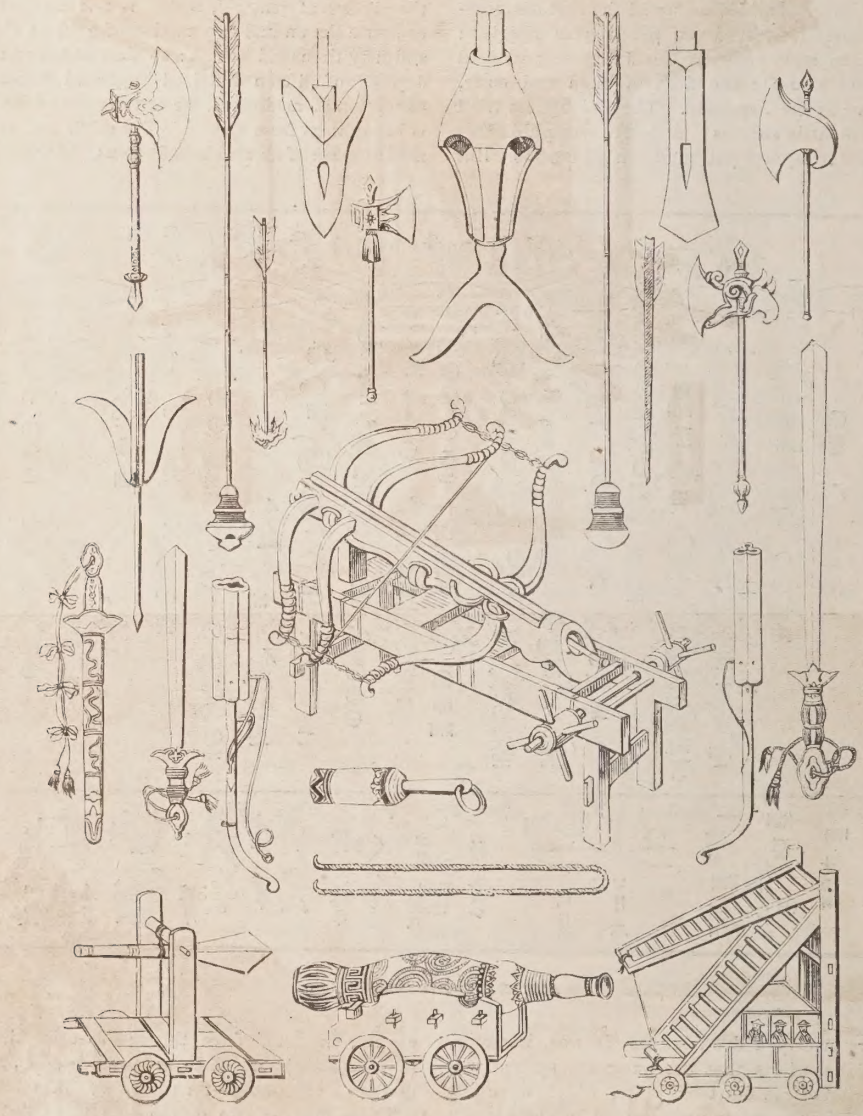
the fords of the river Wata-Si-Mori. It is certainly a very primitive way of conveying goods. The articles of trade are very varied. Much attention is given to the manufacture of arms. Swords they excel in.

The Japanese are very ingenious in manufacturing almanacks for the blind, and other almanacks for general use. Their porcelain has degenerated from its former superiority, owing to a deficiency of the peculiar clay necessary to make it. Their most beautiful silks are woven by high-born criminals, who are confined upon a small, rocky, unproductive island, their property confiscated, and themselves obliged to pay for their daily food with the produce of their manual labour. The exportation of these silks is prohibited.

The circulating medium is gold, silver, and copper; but the gold and silver alone can be properly called coin. They bear the mint stamp, and have a fixed value. Small silver pieces and copper pass by weight. They use paper money and bills of exchange.

The arts are very much in arrear among them, though this is a point on which there is a very great difference of opinion. They are, however, very fond of painting, and are eager collectors of pictures; are said to sketch boldly in charcoal and even in ink, never having occasion to efface; and their outlines are clear, and their drawing as good as can be expected without a knowledge of perspective and anatomy. They are unable to take correct likenesses, and so the professional portrait painters devote themselves to the dress and general appearance rather than the features. In buds and flowers they succeed better; and two folio volumes of paintings of flowers, with the name and properties of each written on the opposite page, the work of a Japanese lady, and by her presented to Herr Tillsing, are highly spoken of. Delicate finishing is their art.

Landscape and figures they do not shine in, though there are in Japan some of the most wondrous scenes which the eye of man has ever beheld. The paintings in their temples are very inferior, though some of the articles of show are elaborately carved and lackered (p. 505). They do not understand oil-painting, but use water-colours with ease. They prepare these from minerals and vegetables, and obtain tints of remarkable beauty.

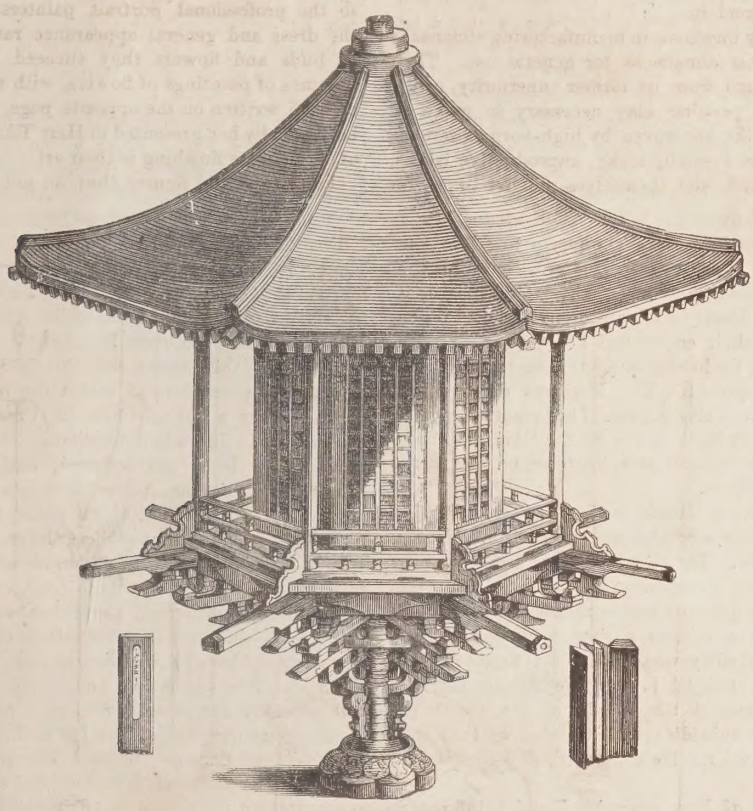


JAPANESE ARMS.

Wood engraving is well known, and engraving on copper has been recently introduced. Sculpture is only known to the extent of a few carvings for ornaments. But they have, on the other hand, a very good idea of the art of casting metals. Their bells, which have no metal tongues, but are

sounded by being struck with wooden mallets, are remarkable for tone and beauty. Of architecture, as an art, they have no conception. The art of cutting precious stones is quite unknown.

It will be seen that, on the whole, Japan has more to gain than to lose from mixing with civilised nations. Now that there is little fear of conquest being attempted, the throwing open of this country to the commerce of the world must be productive of much advantage. We shall have a new system of civilisation to study, and if we are but wise, a new ground wherein to sow the seed of the gospel.



CABINET IN A JAPANESE TEMPLE.

FERRYMEN OF THE WATA-SI-MORI.

RUSSIAN AGGRESSION IN THE EAST.

At the present time a brief sketch of Russian aggression in the East may be valuable and interesting. One of the great and secret designs of this mighty power has been to obtain by diplomacy—which, in her case, means cunning—a powerful influence in our India. No true policy guides her, no scruple is respected, no humanity is known. With exiles perishing on the Kuban, agents sapping the Porte, tyrants in every province, a war establishment in Bessarabia, spies and friends in every country in Europe, her designs are apparent. In sixty years she has advanced from the Don and the Volga to the Aras, and from the Aras her influence is felt in Affghanistan.

She respects not treaties. Her conquests are like the raging of the plague or the cholera. Her arms are like the pestilence or the hurricane; and when she makes peace, it is because there is a desert where millions lived. When the Romans advanced their eagles and arms, they spread a rude kind of civilisation, the hordes of Scythia became civilised by the races they conquered. The Russians destroy the very landmarks and signs of civilisation. They erect a dungeon here, a palace there; they have whips for the slavish, swords for the brave; they are without arts, learning, or literature, except a few borrowed lights.

When by art and cunning Russia made progress in Persia, it was by mingling Gothic with Oriental barbarism. Russia made Persia pay tribute. The English were wont to pay a subsidy to Persia. The government wanted to give up the practice, which in days gone by seems rather to have filled the pockets of worthless ministers than made its way to Persia. But the opportunity was now given to get rid of the impost. England engaged to pay the Shah's debt to Russia, if he would amend the article of the treaty by which they engaged to subsidise him, as well as that respecting the Russian frontier. He consented, though with an ll grace.

The public is aware of how near, by Russian influence, Persia was upon the verge of war with her Mussulman ally, Turkey. But the connexion of Russia with Persia is old. Peter sent an ambassador to the Shah, and then, under the usual pretence of aiding him against some rebels, occupied, and then seized several fine provinces of his kingdom. At the death of Peter, the fate of the state was all but sealed, and the ancient domains of the lofty dynasty were divided between the Affghans, the Turks, and the Tartar hordes of Moscow. Nadir Shah, however, arose, and though cruel and merciless, being possessed of energy and courage, drove out all the usurpers, and became ruler of the whole region to the foot of the Caucasus. But at his death the Russians again seized Georgia, and by a long career of cunning and secret intrigue, almost ruined Persia in the same way that they nearly ruined Turkey and kept back Greece.

England became uneasy. Judging from the past, we looked with dread to the future. We felt confidence in the strength of our Indian empire. But with the cabinet of St. Petersburg ruling in Teheran, in Kabul, and Kandahar, strange things might be expected to occur in the Punjaub and the vale of Kashmeer. We had watched the little insignificant state of Muscovy, once unrecognised, now take a bold front in advance of nearly all nations, while it was quite easy to suppose that influence, which was paramount from the Volga to the Caspian, extending from the Caspian to the Indus.

From Sweden she had taken half her territory; from Poland, plains as vast as the whole Austrian empire; from Turkey in Europe, a slice as large as Prussia; from Turkey in Asia, as much as the Lesser Germanic Confederated States; from Persia, a territory as large as England; from Tartary, a space equal to Turkey in Europe, Greece, Spain, and Portugal. It was impossible, after this, not to mistrust and suspect Russia. There was no wavering sign in her history, no intimation that she would stop. Persia was utterly unable to check her.

In Affghanistan appeared a barrier. That country was always ruled by a usurper. Timur, son of Ahmed, was succeeded by Zeman Shah, a younger son, who blinded his brother, Humayan. He was deposed in the same way by another elder brother. Mahmoud, who succeeded him, was deposed by Sujah-ul-Mulk, who did not, however, blind the man he overthrew. But Mahmoud escaped from prison, dethroned Sujah, and sent him to the Punjaub. Runjit Singh, king of the Five Rivers, welcomed him and robbed him. He appealed to the English, who protected him. Mahmoud had been successful through the ability and activity of his minister, Futteh Khan, whom he allowed to be hewn to pieces at the foot of the throne. His brothers rose in arms, were victorious, and divided Affghanistan among them. Mahmoud fled to Herat, where he died.

Dost Mahommed was the ablest of the brothers of Futteh Khan. He was a bold, bad, wicked man, and by unscrupulous means gained great power. But the country was devastated by civil war. Sujah meanwhile attacked him twice, and Runjit Singh seized upon Peshawar.

It was by this means that Russia hoped to carry out her designs upon the East, of which the possession of Constantinople is only a part. That the Czars have always had an eye on British India is undoubted. The idea is widely spread in Russia. It is the constant, daily, and hourly talk of the army; civil and military servants discuss it. Potemkin and others devised ingenious plans to bring it about, and for many years circumstances have been coming to light which leave no doubt on the minds of politicians and statesmen of the fact. The actual conquest of India by force of arms, and at once, could never have entered the head even of a Nicholas—because the difficulties are such as to be all but insurmountable—and without a powerful navy it could not be held. But she moves on slowly and assiduously to the attainment of her object. She tries to become to the populations of our north-west frontier in India what she is to the deluded Christians of Turkey. Her agents, spies, and friends seek to undermine our influence, and spread discontent. She wanted some provinces in Affghanistan, to give employment to those predatory hordes which compose her armies on the frontiers. Some notion of this kind must have incited her to claim dominion over some of those desolate tracts to the south of the Heavenly Mountains, where battalions of her army annually perish amid glaciers—bare and arid plains, adorned with sand-reeds, garlic, yellow jujube flowers—utterly worthless, in fact. But such plains and hills fill up space on the map of the world, and are therefore coveted by Russia.

We have seen the advances of the Czar through the wilderness to the borders of China; they form probably a long vista, with Pekin at the end. So the tracts of Central Asia and the gullies of Affghanistan are but steps on the road to the ultimate conquest of British India. One mode of conquest was proposed through Khiva, up the Oxus, to Bokhara and the Balk, over the Hindu Kush to Kabul, then by Peshawar, to Attock, Lahore, and Delhi. It would be necessary to reduce Turkestan to subjection, and Kharism and Bokhara must be Russian provinces. But to carry an army over such a space is beyond the power of Russia, if we judge her from the past and present.

But still, though there be no immediate fear of an armed invasion of India, the designs of the Czar are well known and dangerous. Russia threatens, unless present events check him, to become undivided master of Persia. The Czar has spent millions to be paramount at Teheran. This once completely attained, an army might be pushed to the banks of the Indus, Affghanistan attacked, and our north-west frontier be continually assailed.

It will be seen from the above, that, extensive as are the designs of Russia in Turkey, they are not less so elsewhere. When we reflect upon what has been the universal policy of Russia in what she calls colonisation, but one hope can be expressed relative to the future Progress of Russia.*

52nd: 4 sq, 12 l., 1 sq., 24 l., 6 sq., 6 l., 3 sq., 3 l., 5 sq., 15 l., 4 sq., 12 l., 3 sq., 12 l., 1 sq., 24 l., 6 sq., 9 l., 1 sq., 21 l., 1 sq, 9 l., 3 sq.

53rd: 8 sq., 21 l., 1 sq., 3 l., 3 sq., 9 l., 2 sq., 3 l., 3 sq., 3 l, 1 sq., 9 l., 2 sq., 9 l., 2 sq., 6 l., 4 sq., 6 l., 5 sq., 21 l., 1 sq., 3 l., 3 sq., 9 l., 2 sq., 3 l., 1 sq., 21 l., 1 sq., 6 l., 4 sq.

54th: 3 sq., 9 l., 1 sq., 24 l., 1 sq., 3 l., 2 sq., 9 l., 4 sq., 9 l., 2 sq., 15 l., 1 sq., 6 l., 1 sq., 3 l., 8 sq., 9 l., 1 sq., 24 l., 1 sq., 3 l., 2 sq., 9 l., 3 sq., 6 l., 1 sq., 21 l., 6 sq.

55th: 2 sq., 6 l., 3 sq., 21 l., 1 sq., 6 l., 2 sq., 3 l., 5 sq., 6 l., 3 sq., 21 l., 1 sq., 6 l., 8 sq., 6 l., 3 sq., 21 l., 1 sq., 6 l., 2 sq., 3 l., 5 sq., 6 l., 1 sq., 21 l., 1 sq., 6 l., 3 sq.

56th: 2 sq., 6 l., 3 sq., 21 l., 1 sq., 6 l., 8 sq., 6 l., 3 sq., 21 l., 1 sq., 6 l., 2 sq., 3 l., 5 sq., 6 l., 3 sq., 21 l., 1 sq., 6 l., 8 sq., 9 l., 1 sq., 18 l., 2 sq., 6 l., 2 sq.

57th: 3 sq., 9 l., 2 sq., 15 l., 1 sq., 6 l., 1 sq., 3 l., 5 sq., 3 l., 2 sq., 9 l., 1 sq., 24 l., 1 sq., 3 l., 2 sq., 9 l., 4 sq., 9 l., 2 sq., 15 l., 1 sq., 6 l., 1 sq., 3 l., 7 sq., 12 l., 1 sq., 9 l., 5 sq., 3 l., 2 sq.

58th: 6 sq., 3 l., 1 sq., 9 l., 2 sq., 9 l., 2 sq., 6 l., 4 sq., 6 l., 5 sq., 21 l., 1 sq., 3 l., 3 sq., 9 l., 2 sq., 3 l., 3 sq., 3 l., 1 sq., 9 l., 2 sq., 9 l., 2 sq., 6 l., 6 sq. 9 l., 5 sq., 3 l., 2 sq., 6 l., 2 sq.

59th: 5 sq., 3 l., 5 sq., 15 l., 4 sq., 12 l., 3 sq., 12 l., 1 sq., 24 l., 6 sq., 6 l., 3 sq., 3 l., 5 sq., 15 l., 4 sq., 15 l., 1 sq., 9 l., 1 sq., 3 l., 2 sq., 3 l., 1 sq., 9 l., 3 sq.

60th: 5 sq., 3 l., 3 sq., 3 l., 1 sq., 12 l., 3 sq., 6 l., 1 sq., 3 l., 5 sq., 15 l., 2 sq., 15 l., 4 sq., 9 l., 1 sq., 3 l., 3 sq., 3 l., 3 sq., 3 l., 1 sq., 12 l., 3 sq., 6 l., 1 sq., 3 l., 5 sq., 6 l., 1 sq., 3 l., 2 sq., 3 l., 7 sq.

61st: 5 sq., 6 l., 1 sq., 6 l., 2 sq., 6 l., 4 sq., 6 l., 8 sq., 18 l., 3 sq., 21 l., 2 sq., 6 l., 3 sq., 6 l., 1 sq., 6 l., 2 sq., 6 l., 4 sq., 6 l., 10 sq., 12 l., 7 sq.

62nd: 6 sq., 9 l., 21 sq., 24 l., 8 sq., 3 l., 5 sq., 9 l., 22 sq., 6 l., 8 sq.

63rd: 1 row of squares.

64th: Turn back, 4 double l., made by first twisting the cotton twice over the hook, then 4 double long to come in the 1st 4 loops, which will exactly fill up the 4 loops over 1st sq., then 5 ch., miss 2 squares, 4 more double long in the 4th loop of next sq., repeat, the row will end with 1 long stitch, turn back.

65th: 5 d.c. under the 5 ch., 4 ch., repeat. This forms the front of the case.

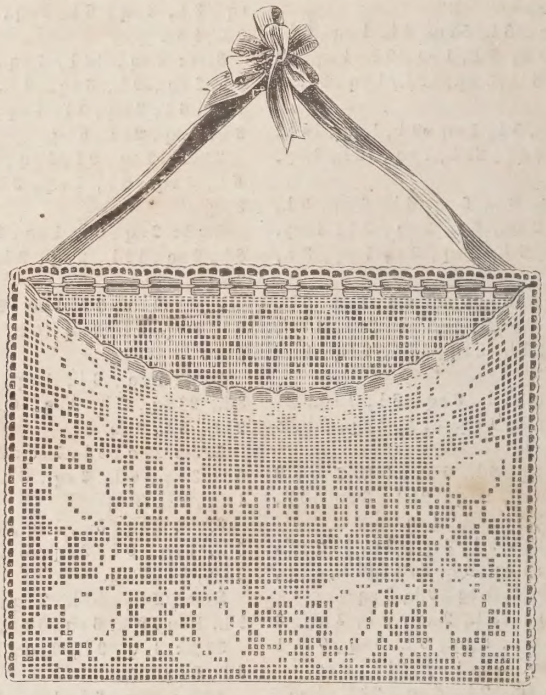
For the Back: Commence on the wrong side of the foundation chain, and work 41 rows of squares, then work as at 42nd row, and continue working till the end of 62nd row.

Now 2 rows of squares.

Now a row of double long stitches the same as the row on the other end. Turn back.

1 double l. on l., *5 ch., 4 double l. on the l., repeat from*.

Now a row of long stitches, not double long.



HANDKERCHIEF CASE, FOR HANGING TO THE HEAD OF A BED.

Now work 3 d.c. into every space up both sides, then crochet both sides together on the right side, by working 1 d c. stitch into every loop of both sides, first doubling it at the foundation chain, consequently the back will be a trifle higher than the front.

Now, up the side and along the top of the back, work thus: 1 l. in 1st loop, *9 ch., 1 l. into 7th loop, repeat from* and at each corner make 2 l. into 1 loop, with 9 ch. between each l.

Next row, 9 d.c. under every 9 ch.

Cover 2 strips of narrow whalebone the exact length of the back of the case, with coloured ribbon, and run it into the 2 open rows; for the front, cut a length of whalebone two inches longer than the pieces for the back, and run in the front row, then add ribbon and bow as in engraving.

END OF VOL. II.
